**Procedure**—Concomitantly record the absorption spectra of the *Standard preparation* and the *Test preparation* from about 11 μm to about 13 μm, with a suitable IR absorption spectrophotometer, using an empty cell to set the instrument to 100 percent transmittance. Adjust the cell thickness of the *Standard preparation* and of the *Test preparation* so that transmittances of 20% to 30% are obtained at 12.3 μm. On each spectrum, draw a straight baseline between the absorption minima at wavelengths of about 11.3 μm and 12.65 μm. Draw straight lines, perpendicular to the wavelength scale, at the wavelengths of maximum absorption at about 11.65 μm and 11.86 μm, intersecting both the baseline and the spectrum. Determine the absorbance ratio:

$$(A_{11.65a} - A_{11.65b}) / (A_{11.86a} - A_{11.86b})$$

in which the parenthetical expressions are the differences in absorbance values obtained at the wavelengths indicated by the subscripts for the spectrum (a) and at the point of intersection of the perpendicular line with the baseline (b). The absorbance ratio of the *Test preparation* is greater than that of the *Standard preparation*, corresponding to not more than 10% of polymorph A.

#### Assay—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Chloramphenicol Palmitate*.

**Assay preparation**—Transfer an accurately measured volume of Oral Suspension, well-shaken and free from air bubbles, equivalent to about 160 mg of chloramphenicol, to a 200-mL volumetric flask containing about 20 mL of methanol, add 4 mL of glacial acetic acid, dilute with methanol to volume, and mix. Filter about 20 mL of this solution through glass-fiber filter paper. Transfer 10.0 mL of the filtrate to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chloramphenicol Palmitate*. Calculate the quantity, in mg, of chloramphenicol (C<sub>11</sub>H<sub>12</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>5</sub>) equivalent in each mL of Oral Suspension taken by the formula:

$$0.004(W_S / V)(P_S)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of Oral Suspension taken, and the other terms are as defined therein.

## Chloramphenicol Sodium Succinate

$C_{15}H_{15}Cl_2N_2NaO_8$  445.18

Butanedioic acid, mono[2-[(2,2-dichloroacetyl)amino]-3-hydroxy-3-(4-nitrophenyl)propyl] ester, monosodium salt, [*R*-(*R*\*,*R*\*)]-.

D-threo-(-)-2,2-Dichloro-N-[[β-hydroxy-α-(hydroxymethyl)-p-nitrophenethyl]acetamide α-(sodium succinate) [982-57-0].

» Chloramphenicol Sodium Succinate has a potency equivalent to not less than 650 µg and not more than 765 µg of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) per mg.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of sterile dosage forms.

**USP Reference standards** (11)—

USP Chloramphenicol RS

USP Endotoxin RS

**Identification**—The *Assay preparation* exhibits an absorption maximum at a wavelength of about 276 nm, as obtained in the *Assay*.

**Specific rotation** (781S): between +5.0° and +8.0°.

*Test solution*: 50 mg per mL.

**pH** (791): between 6.4 and 7.0, in a solution containing the equivalent of 250 mg of chloramphenicol per mL.

**Water, Method I** (921): not more than 5.0%.

**Limit of free chloramphenicol**—

*Mobile phase*—Prepare a filtered and degassed mixture of 0.05 M monobasic ammonium phosphate, previously adjusted with 10% (v/v) phosphoric acid to a pH of  $2.5 \pm 0.1$ , and methanol (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in *Mobile phase* to obtain a solution having a known concentration of about 6 µg per mL. Pass this solution through a filter having a 0.5-µm or finer porosity, and use the filtrate.

*Test solution*—Transfer about 33 mg of Chloramphenicol Sodium Succinate, accurately weighed, to a 50-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a filter having a 0.5-µm or finer porosity.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 275-nm detector and a 4.6-mm × 10-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the two major peaks, chloramphenicol-1-succinate and chloramphenicol-3-succinate, is not less than 1750 theoretical plates; the resolution, *R*, between the two peaks is not less than 2.0; and the tailing factor is not more than 1.2. Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure*: the relative standard deviation for replicate injections is not less than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the free chloramphenicol peaks. Calculate the percentage of free chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) in the

portion of Chloramphenicol Sodium Succinate taken by the formula:

$$5000(C / WQ)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Chloramphenicol RS in the *Standard solution*; *W* is the quantity, in mg, of Chloramphenicol Sodium Succinate taken to prepare the *Test solution*; *Q* is the quantity, in µg, of chloramphenicol in each mg of Chloramphenicol Sodium Succinate taken, as obtained in the *Assay*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 2.0% is found.

**Other requirements**—Where the label states that Chloramphenicol Sodium Succinate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Chloramphenicol Sodium Succinate for Injection*. Where the label states that Chloramphenicol Sodium Succinate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Chloramphenicol Sodium Succinate for Injection*.

**Assay**—

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chloramphenicol RS in water, and dilute quantitatively with water to obtain a solution having a known concentration of about 20 µg per mL.

*Assay preparation*—Dissolve an accurately weighed quantity of Chloramphenicol Sodium Succinate in water, and dilute quantitatively with water to obtain a solution having a concentration equivalent to about 20 µg of chloramphenicol per mL.

*Procedure*—Concomitantly determine the absorbance of the *Standard preparation*, at the wavelength of maximum absorbance at about 278 nm, and the absorbance of the *Assay preparation*, at the wavelength of maximum absorbance at about 276 nm, in 1-cm cells, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in µg, of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) in each mg of Chloramphenicol Sodium Succinate taken by the formula:

$$(CP / W)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Chloramphenicol RS in the *Standard preparation*; *P* is the potency, in µg per mg, of USP Chloramphenicol RS; *W* is the weight, in µg, of Chloramphenicol Sodium Succinate taken in each mL of the *Assay preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Chloramphenicol Sodium Succinate for Injection

» Chloramphenicol Sodium Succinate for Injection contains an amount of Chloramphenicol Sodium Succinate equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Chloramphenicol RS

USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 0.2 USP Endotoxin Unit per mg of chloramphenicol.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Limit of free chloramphenicol—**

*Mobile phase, Standard solution, and Chromatographic system*—Proceed as directed in the test for *Limit of free chloramphenicol* under *Chloramphenicol Sodium Succinate*.

*Test solution*—Dissolve the contents of 1 container in a volume of *Mobile phase* to obtain a solution containing the equivalent of about 100 mg of chloramphenicol per mL. Dilute this solution quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution containing the equivalent of about 0.5 mg of chloramphenicol per mL. Pass a portion of this solution through a filter having a 0.5- $\mu$ m or finer porosity, and use the filtrate.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the free chloramphenicol peaks. Calculate the percentage of free chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ) in the specimen taken by the formula:

$$0.1(C/D)(r_U/r_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Chloramphenicol RS in the *Standard solution*; *D* is the concentration, in mg per mL, of chloramphenicol equivalent in the *Test solution*, based on the labeled quantity in the container and the extent of dilution; and  $r_U$  and  $r_S$  are the chloramphenicol peak areas obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 2.0% is found.

**Other requirements**—It meets the requirements of the tests for *Identification*, *Specific rotation*, *pH*, and *Water* under *Chloramphenicol Sodium Succinate*.

**Assay—**

*Standard preparation*—Proceed as directed in the *Assay* under *Chloramphenicol Sodium Succinate*.

*Assay preparation*—Constitute 1 container of Chloramphenicol Sodium Succinate for Injection as directed in the labeling. Dilute an accurately measured volume of the constituted solution quantitatively with water to obtain a solution having a concentration of about 20  $\mu$ g of chloramphenicol per mL.

*Procedure*—Proceed as directed in the *Assay* under *Chloramphenicol Sodium Succinate*. Calculate the quantity, in mg, of chloramphenicol ( $C_{11}H_{12}Cl_2N_2O_5$ ), in each mL of the constituted Chloramphenicol Sodium Succinate for Injection taken by the formula:

$$(L/D)(CP/1000)(A_U/A_S)$$

in which *L* is the labeled quantity, in mg, of chloramphenicol in each mL of constituted solution; *D* is the concentration, in  $\mu$ g per mL, of chloramphenicol in the *Assay preparation*, on the basis of the labeled quantity of chloramphenicol in each mL of constituted solution and the extent of dilution; *C* is the concentration, in  $\mu$ g per mL, of USP Chloramphenicol RS in the *Standard preparation*; *P* is the potency, in  $\mu$ g per mg, of USP Chloramphenicol RS; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Chlordiazepoxide

$C_{16}H_{14}ClN_3O$  299.75

3*H*-1,4-Benzodiazepin-2-amine, 7-chloro-*N*-methyl-5-phenyl-, 4-oxide.

7-Chloro-2-(methylamino)-5-phenyl-3*H*-1,4-benzodiazepine 4-oxide [58-25-3].

» Chlordiazepoxide contains not less than 98.0 percent and not more than 102.0 percent of  $C_{16}H_{14}ClN_3O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP 2-Amino-5-chlorobenzophenone RS

$C_{13}H_{10}ClNO$  231.68

USP Chlordiazepoxide RS

USP Chlordiazepoxide Related Compound A RS

7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepine-2-one 4-oxide.

$C_{15}H_{11}ClN_2O^2$  286.72

**Identification—**

**A:** *Infrared Absorption* <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**C:** To about 20 mg add 5 mL of hydrochloric acid and 10 mL of water, and heat to boiling to effect hydrolysis. To the cooled solution add 2 mL of sodium nitrite solution (1 in 1000), shake, add 1 mL of ammonium sulfamate solution (1 in 200), then shake for 2 minutes, and add 1 mL of *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000): a reddish violet color is produced.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 0.3% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals**, *Method II* <231>: 0.002%.

**Related compounds**—Transfer 50.0 mg to a 10-mL conical flask, add 2.5 mL of acetone, and shake. Allow any undissolved particles to settle, and apply 50  $\mu$ L of the supernatant to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Apply to the same plate 10  $\mu$ L of an acetone solution containing 100  $\mu$ g per mL of USP Chlordiazepoxide Related Compound A RS and 10  $\mu$ L of an acetone solution containing 10  $\mu$ g per mL of USP 2-Amino-5-chlorobenzophenone RS. Develop the chromatogram in a chromatographic chamber (not previously saturated with the developing solvent) in ethyl acetate until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with 2 N sulfuric acid, drying at 105° for 15 minutes, and then spraying in succession with sodium nitrite solution (1 in 1000), ammonium sulfamate solution (1 in 200), and *N*-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000). Any spots from the test solution are not greater in size or intensity than the spots at the respective  $R_f$  values produced by the Standard solutions, corresponding to not more than

0.1% of chlordiazepoxide related compound A, and to not more than 0.01% of 2-amino-5-chlorobenzophenone.

**Assay**—[NOTE—Use low-actinic glassware in this procedure.]

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlordiazepoxide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 200 µg per mL.

**Assay preparation**—Transfer about 100 mg of Chlordiazepoxide, accurately weighed, to a 50-mL volumetric flask, dissolve in *Mobile phase*, sonicate for 5 minutes, dilute with *Mobile phase* to volume, and mix. Pass this solution through a membrane filter having a 0.5-µm or finer porosity. Transfer 10 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase*, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*; the column efficiency is not less than 3600 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>16</sub>H<sub>14</sub>ClN<sub>3</sub>O in the portion of Chlordiazepoxide taken by the formula:

$$0.5C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of the USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlordiazepoxide Tablets

» Chlordiazepoxide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>16</sub>H<sub>14</sub>ClN<sub>3</sub>O.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP 2-Amino-5-chlorobenzophenone RS

C<sub>13</sub>H<sub>10</sub>ClNO 231.68

USP Chlordiazepoxide RS

USP Chlordiazepoxide Related Compound A RS  
7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one 4-oxide.

C<sub>15</sub>H<sub>11</sub>ClN<sub>2</sub>O<sup>2</sup> 286.72

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**B:** A portion of finely powdered Tablets, equivalent to about 20 mg of chlordiazepoxide, responds to *Identification* test C under *Chlordiazepoxide*.

**Dissolution** (711)—

**Medium:** simulated gastric fluid TS, prepared without pepsin; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of C<sub>16</sub>H<sub>14</sub>ClN<sub>3</sub>O dissolved from UV absorbances at the wavelength of maximum absorbance at about 309 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Chlordiazepoxide RS in the same medium.

**Tolerances**—Not less than 85% (Q) of the labeled amount of C<sub>16</sub>H<sub>14</sub>ClN<sub>3</sub>O is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Related compounds**—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to about 25 mg of chlordiazepoxide, to a 10-mL conical flask, and proceed as directed in the test for *Related compounds* under *Chlordiazepoxide*, beginning with “add 2.5 mL of acetone,” except to use 20 µL of an acetone solution containing 1 mg per mL of USP Chlordiazepoxide Related Compound A RS instead of 10 µL of an acetone solution containing 100 µg per mL of the Reference Standard, and except to use 5 µL of an acetone solution containing 100 µg per mL of USP 2-Amino-5-chlorobenzophenone RS instead of 10 µL of an acetone solution containing 10 µg per mL of the Reference Standard. Any spots from the test solution are not greater in size or intensity than the spots at the respective  $R_f$  values produced by the Standard solutions, corresponding to not more than 4.0% of chlordiazepoxide related compound A, and to not more than 0.1% of 2-amino-5-chlorobenzophenone.

**Assay**—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Chlordiazepoxide*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of chlordiazepoxide, to a 25-mL volumetric flask, add 20 mL of *Mobile phase*, sonicate for 5 minutes to dissolve, dilute with *Mobile phase* to volume, mix, and filter through a 5-µm membrane filter, discarding the first 5 mL of the filtrate.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Chlordiazepoxide*. Calculate the quantity, in mg, of C<sub>16</sub>H<sub>14</sub>ClN<sub>3</sub>O in the portion of Tablets taken by the formula:

$$25C(r_U / r_S)$$

## Chlordiazepoxide and Amitriptyline Hydrochloride Tablets

» Chlordiazepoxide and Amitriptyline Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of chlordiazepoxide (C<sub>16</sub>H<sub>14</sub>ClN<sub>3</sub>O) and an amount of amitriptyline hydrochloride equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of amitriptyline (C<sub>20</sub>H<sub>23</sub>N).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP 2-Amino-5-chlorobenzophenone RS

C<sub>13</sub>H<sub>10</sub>ClNO 231.68

USP Amitriptyline Hydrochloride RS

USP Chlordiazepoxide RS

USP Chlordiazepoxide Related Compound A RS  
7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-  
2-one 4-oxide.  
 $C_{15}H_{11}ClN_2O^2$  286.72

**Identification**—The retention times of the major peaks in the chromatogram of the *Assay preparation* are the same as those of the *Standard preparation* as obtained in the *Assay*.

**Dissolution** (711)—

*Medium*: simulated gastric fluid TS, prepared without pepsin; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

*Procedure*—Determine the absorbances of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, and Standard solutions having known concentrations of USP Chlordiazepoxide RS and USP Amitriptyline Hydrochloride RS in the same *Medium*, at wavelengths of 239 nm and 309 nm, using *Dissolution Medium* as the blank. Calculate the percentage of chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ) dissolved by the formula:

$$100(CD / L)(A_U / A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chlordiazepoxide RS in the *Standard solution* determined at the wavelength of 309 nm;  $D$  is the dilution factor of the diluted solution under test;  $L$  is the labeled amount, in mg, of chlordiazepoxide in each Tablet; and  $A_U$  and  $A_S$  are the absorbances of the solution under test and the chlordiazepoxide *Standard solution*, respectively, at the wavelength of 309 nm.

Calculate the percentage of amitriptyline ( $C_{20}H_{23}N$ ) dissolved by the formula:

$$100(277.40/313.86)(CD / L)(A_X / A_S)$$

in which 277.40 and 313.86 are the molecular weights of amitriptyline and amitriptyline hydrochloride, respectively;  $C$  is the concentration, in mg per mL, of USP Amitriptyline Hydrochloride RS in the amitriptyline *Standard solution*;  $D$  is the dilution factor of the diluted solution under test;  $L$  is the labeled amount, in mg, of amitriptyline in each Tablet;  $A_S$  is the absorbance of the amitriptyline *Standard solution* at the wavelength of 239 nm; and  $A_X$  is defined by the formula:

$$A_{U239} - A_{U309} (C_{309} A_{S239} / C_{239} A_{S309})$$

in which  $A_{U239}$  and  $A_{U309}$  are the absorbances of the solution under test measured at 239 nm and 309 nm, respectively;  $C_{309}$  and  $C_{239}$  are the concentrations, in mg per mL, of USP Chlordiazepoxide RS in the *Standard solution* obtained at wavelengths of 309 and 239 nm, respectively; and  $A_{S239}$  and  $A_{S309}$  are the absorbances of the chlordiazepoxide *Standard solution* determined at the wavelengths indicated in the subscripts. [NOTE—All of the chlordiazepoxide measurements may be made with either a single *Standard solution* or two separate *Standard solutions*.]

**Tolerances**—Not less than 85% ( $Q$ ) of the labeled amount of chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ) and an amount of amitriptyline hydrochloride equivalent to not less than 85% ( $Q$ ) of the labeled amount of amitriptyline ( $C_{20}H_{23}N$ ) are dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements for *Content Uniformity* with respect to chlordiazepoxide and to amitriptyline.

**Related compounds**—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to about 25 mg of chlordiazepoxide, to a 10-mL conical flask, add 2.5 mL of

acetone, and shake. Allow any undissolved particles to settle, and apply 50  $\mu$ L of the supernatant to a thin-layer chromatographic plate (see *Chromatography* (621)), coated with a 0.25-mm layer of chromatographic silica gel. Apply to the same plate 20  $\mu$ L of an acetone solution containing 1 mg per mL of USP Chlordiazepoxide Related Compound A RS and 10  $\mu$ L of an acetone solution containing 50  $\mu$ g per mL of USP 2-Amino-5-chlorobenzophenone RS. Develop the chromatogram in a chromatographic chamber (not previously saturated with the developing solvent) in ethyl acetate until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with 2 N sulfuric acid, drying at 105° for 15 minutes, and then spraying in succession with sodium nitrite solution (1 in 1000), ammonium sulfamate solution (1 in 200), and N-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000): any spots from the test solution are not greater in size or intensity than the spots at the respective  $R_f$  values produced by the *Standard solutions*, corresponding to not more than 4.0% of chlordiazepoxide related compound A, and not more than 0.1% of 2-amino-5-chlorobenzophenone.

**Assay**—[NOTE—Use low-actinic glassware in this procedure.]

*pH 2.5 Buffer*—Mix 10.5 mL of 0.20 N sodium hydroxide with 100 mL of a solution consisting of 0.04 M acetic acid, 0.04 M phosphoric acid, and 0.04 M boric acid (prepared by dissolving 2.402 g of glacial acetic acid, 4.612 g of phosphoric acid, and 2.473 g of boric acid in sufficient water to obtain 1000 mL of solution).

*Solvent mixture*—Prepare a mixture consisting of *pH 2.5 Buffer*, tetrahydrofuran, and methanol (5:4:1).

*Mobile phase*—Prepare a solution of 0.01 M sodium lauryl sulfate in *Solvent mixture*.

*Standard preparation*—Dissolve accurately weighed quantities of USP Chlordiazepoxide RS and USP Amitriptyline Hydrochloride RS in *Solvent mixture*, and quantitatively dilute with *Solvent mixture* to obtain a solution having known concentrations of about 1 mg of USP Chlordiazepoxide RS per mL and about 2.8 mg of USP Amitriptyline Hydrochloride RS per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of chlordiazepoxide and about 125 mg of amitriptyline, to a 50-mL volumetric flask, add *Solvent mixture* to volume, sonicate to disperse the mixture, and allow undissolved particles to settle. Transfer 10.0 mL of the resulting solution to a 100-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix. Pass a portion of this solution through a filter having a 5- $\mu$ m or finer porosity, and use the filtrate as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—The chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, and record the chromatogram. Measure the peak responses at approximate retention times of 5 minutes for chlordiazepoxide and 7 minutes for amitriptyline hydrochloride. Calculate the quantity, in mg, of

chlordiazepoxide ( $C_{16}H_{14}ClN_3O$ ) in the portion of Tablets taken by the formula:

$$0.5[C(r_U / r_S)]_Z$$

and calculate the quantity, in mg, of amitriptyline ( $C_{20}H_{23}N$ ) in the portion of Tablets taken by the formula:

$$(277.40/313.86)[(0.5C)(r_U / r_S)]_Y$$

in which Z denotes chlordiazepoxide; Y denotes amitriptyline hydrochloride; 277.40 is the molecular weight of amitriptyline; 313.86 is the molecular weight of amitriptyline hydrochloride; C is the concentration, in  $\mu\text{g}$  per mL, of USP Reference Standard in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlordiazepoxide Hydrochloride

$C_{16}H_{14}ClN_3O \cdot HCl$  336.22  
3H-1,4-Benzodiazepin-2-amine, 7-chloro-N-methyl-5-phenyl-4-oxide, monohydrochloride.  
7-Chloro-2-(methylamino)-5-phenyl-3H-1,4-benzodiazepine 4-oxide monohydrochloride [438-41-5].

» Chlordiazepoxide Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{16}H_{14}ClN_3O \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

### USP Reference standards (11)—

USP 2-Amino-5-chlorobenzophenone RS  
 $C_{13}H_{10}ClNO$  231.68  
USP Chlordiazepoxide Hydrochloride RS  
USP Chlordiazepoxide Related Compound A RS  
7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one 4-oxide.  
 $C_{15}H_{11}ClN_2O^2$  286.72  
USP Endotoxin RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** The relative retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

**C:** To about 20 mg add 5 mL of hydrochloric acid and 10 mL of water, and heat to boiling to effect hydrolysis. To the cooled solution add 2 mL of sodium nitrite solution (1 in 1000), 1 mL of ammonium sulfamate solution (1 in 200), and 1 mL of N-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000): a reddish violet color is produced.

**Melting range**, *Class I* (741): between  $212^\circ$  and  $218^\circ$ , with decomposition.

**Loss on drying** (731)—Dry it in vacuum over phosphorus pentoxide at  $60^\circ$  for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.002%.

**Related compounds**—It meets the requirements of the test for *Related compounds* under *Chlordiazepoxide*.

**Other requirements**—Where the label states that Chlordiazepoxide Hydrochloride is sterile, it meets the re-

quirements for *Sterility Tests* (71) and *Labeling* under *Injections* (1), and *Bacterial endotoxins* under *Chlordiazepoxide Hydrochloride for Injection*. Where the label states that Chlordiazepoxide Hydrochloride must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Chlordiazepoxide Hydrochloride for Injection*.

**Assay**—[NOTE—Use low-actinic glassware in this procedure.] Proceed as directed in the *Assay* under *Chlordiazepoxide*, except to use USP Chlordiazepoxide Hydrochloride RS when preparing the *Standard preparation*.

## Chlordiazepoxide Hydrochloride Capsules

» Chlordiazepoxide Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{14}ClN_3O \cdot HCl$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP 2-Amino-5-chlorobenzophenone RS  
 $C_{13}H_{10}ClNO$  231.68  
USP Chlordiazepoxide Hydrochloride RS  
USP Chlordiazepoxide Related Compound A RS  
7-chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one 4-oxide.  
 $C_{15}H_{11}ClN_2O^2$  286.72

### Identification—

**A:** Transfer a portion of the Capsule powder, equivalent to about 60 mg of chlordiazepoxide hydrochloride, to a 100-mL flask. Add methanol to volume, mix, and filter, discarding the first 15 mL of the filtrate. Pipet 5 mL of the clear filtrate into a 100-mL volumetric flask, and add a 1 in 360 solution of sulfuric acid in dehydrated alcohol to volume. Pipet 10 mL of this solution into a 50-mL volumetric flask, and dilute with the same acidified alcohol to volume. The resulting solution exhibits maxima at  $245 \pm 2$  nm and  $311 \pm 2$  nm, and the ratio  $A_{245}/A_{311}$  is between 2.90 and 3.45, using the acidified alcohol as the blank and a 1-cm cell.

**B:** A portion of the contents of Capsules responds to *Identification test C* under *Chlordiazepoxide Hydrochloride*.

### Dissolution (711)—

**Medium:** water; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

**Procedure**—Measure the amount in solution in filtered portions of the *Dissolution Medium*, suitably diluted, in 1-cm cells at the wavelength of maximum absorbance at about 245 nm, with a suitable spectrophotometer, in comparison with a Standard solution of known concentration of USP Chlordiazepoxide Hydrochloride RS. Remove the contents of 12 Capsules as completely as possible with the aid of a current of air. Dissolve the empty capsule shells in 900 mL of *Dissolution Medium*. Filter a portion of the solution, and determine the absorbance at the same dilution and in the same manner as for the Capsules, making any necessary modifications.

**Tolerances**—Not less than 85% (Q) of the labeled amount of  $C_{16}H_{14}ClN_3O \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—[NOTE—Use low-actinic glassware in this procedure.] Transfer the contents of 1 Cap-

sule to a 200-mL volumetric flask, dissolve in and dilute with water to volume, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the filtrate quantitatively and stepwise with 0.1 N hydrochloric acid to obtain a solution having a concentration of about 6 µg of chlordiazepoxide hydrochloride per mL. Dissolve a suitable quantity of USP Chlordiazepoxide Hydrochloride RS, accurately weighed, in 0.1 N hydrochloric acid to obtain a Standard solution having a known concentration of about 6 µg per mL. Concomitantly determine the absorbances of the two solutions in 1-cm cells at the wavelength of maximum absorbance at about 245 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{16}H_{14}ClN_3O \cdot HCl$  in the Capsule by the formula:

$$(T / D)C(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of chlordiazepoxide hydrochloride in the Capsule; *D* is the concentration, in µg per mL, of chlordiazepoxide hydrochloride in the test solution, based on the labeled quantity per Capsule and the extent of dilution; *C* is the concentration, in µg per mL, of USP Chlordiazepoxide Hydrochloride RS in the Standard solution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the contents of the Capsule and the Standard solution, respectively.

**Related compounds**—Proceed as directed for *Related compounds* under *Chlordiazepoxide Hydrochloride*, but use an accurately weighed portion of Capsule contents, equivalent to about 25 mg of chlordiazepoxide hydrochloride, and use 15 µL of a 1 in 1000 solution of USP Chlordiazepoxide Related Compound A RS in acetone and 10 µL of a 1 in 20,000 solution of USP 2-Amino-5-chlorobenzophenone RS in acetone. Not more than 3.0% of chlordiazepoxide related compound A is found, and not more than 0.1% of 2-amino-5-chlorobenzophenone is found.

**Assay**—[NOTE—Use low-actinic glassware in this procedure.] Proceed as directed in the Assay under *Chlordiazepoxide Tablets* except to use an accurately weighed portion of capsule contents equivalent to about 5 mg of chlordiazepoxide hydrochloride and USP Chlordiazepoxide Hydrochloride RS in preparing the *Standard preparation*.

## Chlordiazepoxide Hydrochloride for Injection

» Chlordiazepoxide Hydrochloride for Injection is Chlordiazepoxide Hydrochloride suitable for parenteral use.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1), protected from light.

**USP Reference standards** (11)—

USP 2-Amino-5-chlorobenzophenone RS  
 $C_{13}H_{10}ClNO$  231.68

USP Chlordiazepoxide Hydrochloride RS

USP Chlordiazepoxide Related Compound A RS  
7-chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one 4-oxide.  
 $C_{15}H_{11}ClN_2O_2$  286.72

USP Endotoxin RS

**Completeness of solution** (641)—It dissolves in the solvent and in the concentration recommended in the labeling to yield a clear solution.

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Labeling* under *Injections* (1).

**Bacterial endotoxins** (85)—It contains not more than 3.57 USP Endotoxin Units per mg of chlordiazepoxide hydrochloride.

**pH** (791): between 2.5 and 3.5, in a solution (1 in 100).

**Other requirements**—It responds to the *Identification* tests and meets the requirements of the tests for *Loss on drying* and *Heavy metals* under *Chlordiazepoxide Hydrochloride*, and the test for *Related compounds* under *Chlordiazepoxide*. It meets also the requirements for *Sterility Tests* (71), *Uniformity of Dosage Units* (905), and *Labeling* under *Injections* (1).

**Assay**—Proceed with Chlordiazepoxide Hydrochloride for Injection as directed in the Assay under *Chlordiazepoxide*, except to use USP Chlordiazepoxide Hydrochloride RS to prepare the *Standard preparation*.

## Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules

### DEFINITION

Chlordiazepoxide Hydrochloride and Clidinium Bromide Capsules contain NLT 90.0% and NMT 110.0% of the labeled amounts of chlordiazepoxide hydrochloride ( $C_{16}H_{14}ClN_3O \cdot HCl$ ) and clidinium bromide ( $C_{22}H_{26}BrNO_3$ ).

### IDENTIFICATION

- **A.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

[NOTE—Use low-actinic glassware.]

**Buffer:** Dissolve 1.92 g of sodium 1-pentanesulfonate in 900 mL of water in a 1-L volumetric flask. Adjust with 1 N sulfuric acid to a pH of  $3.8 \pm 0.1$ . Dilute with water to volume.

**Mobile phase:** Methanol, tetrahydrofuran, and *Buffer* (6:24:70)

**Diluent:** Methanol and water (1:1)

**Standard solution:** 0.1 mg/mL of USP Chlordiazepoxide Hydrochloride RS and 0.05 mg/mL of USP Clidinium Bromide RS in *Diluent*

**Sample solution:** Weigh the contents of NLT 20 Capsules, and calculate the average weight per Capsule. Mix the combined contents of the Capsules, and transfer an amount equivalent to about 5 mg of chlordiazepoxide hydrochloride ( $C_{16}H_{14}ClN_3O \cdot HCl$ ) to a 50-mL volumetric flask. Add about 25 mL of *Diluent*, sonicate for 5 min, and shake by mechanical means for 10 min. Dilute with *Diluent* to volume, and filter, discarding the first 20 mL of the filtrate.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 212 nm

**Column:** 8-mm × 10-cm; packing L1

**Flow rate:** 3 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for clidinium bromide and chlordiazepoxide hydrochloride are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 5.0 between the clidinium bromide and chlordiazepoxide hydrochloride peaks

Relative standard deviation: NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of chlordiazepoxide hydrochloride ( $C_{16}H_{14}ClN_3O \cdot HCl$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of chlordiazepoxide hydrochloride from the *Sample solution*  
 $r_S$  = peak response of chlordiazepoxide hydrochloride from the *Standard solution*  
 $C_S$  = concentration of USP Chlordiazepoxide Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of chlordiazepoxide hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of clidinium bromide ( $C_{22}H_{26}BrNO_3$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of clidinium bromide from the *Sample solution*  
 $r_S$  = peak response of clidinium bromide from the *Standard solution*  
 $C_S$  = concentration of USP Clidinium Bromide RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of clidinium bromide in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION, *Procedure for a Pooled Sample* (711)

**Medium:** Water; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Buffer:** Dissolve 1.92 g of sodium 1-pentanesulfonate in 900 mL of water in a 1-L volumetric flask. Adjust with dilute sulfuric acid to a pH of  $3.8 \pm 0.1$ . Dilute with water to volume.

**Mobile phase:** Methanol, tetrahydrofuran, and *Buffer* (6:18:75)

**Standard solution:** Prepare a solution having known concentrations of USP Chlordiazepoxide Hydrochloride RS and USP Clidinium Bromide RS in *Medium*.

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Combine equal volumes of the filtered solutions and use the pooled sample for the analysis. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*, if necessary.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 212 nm

**Column:** 4-mm  $\times$  25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection size:** 100  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for clidinium bromide and chlordiazepoxide hydrochloride are about 0.6 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 5.0 between the clidinium bromide and chlordiazepoxide hydrochloride peaks

Relative standard deviation: NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the average percentage of chlordiazepoxide hydrochloride ( $C_{16}H_{14}ClN_3O \cdot HCl$ ) or clidinium bromide ( $C_{22}H_{26}BrNO_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response of chlordiazepoxide hydrochloride or clidinium bromide from the *Sample solution*  
 $r_S$  = peak response of chlordiazepoxide hydrochloride or clidinium bromide from the *Standard solution*  
 $C_S$  = concentration of USP Chlordiazepoxide Hydrochloride RS or USP Clidinium Bromide RS in the *Standard solution* (mg/mL)  
 $L$  = chlordiazepoxide hydrochloride or clidinium bromide label claim (mg)  
 $V$  = volume of *Medium* (mL), 900

**Tolerances:** NLT 75% (Q) each of the labeled amounts of chlordiazepoxide hydrochloride ( $C_{16}H_{14}ClN_3O \cdot HCl$ ) and clidinium bromide ( $C_{22}H_{26}BrNO_3$ ) are dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

#### IMPURITIES

##### • LIMIT OF CHLORDIAZEPOXIDE RELATED COMPOUND A AND 2-AMINO-5-CHLOROBENZOPHENONE

**Standard solution A:** 1 mg/mL of USP Chlordiazepoxide Related Compound A RS in acetone

**Standard solution B:** 50  $\mu$ g/mL of USP 2-Amino-5-chlorobenzophenone RS in acetone

**Sample solution:** Transfer an amount equivalent to 25 mg of chlordiazepoxide hydrochloride from Capsule contents to a 10-mL conical flask, add 2.5 mL of acetone, and shake. Allow any undissolved particles to settle, and use the supernatant.

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 50  $\mu$ L for the *Sample solution*, 15  $\mu$ L for *Standard solution A*, and 10  $\mu$ L for *Standard solution B*

**Developing solvent system:** Ethyl acetate

**Spray reagent:** 2 N sulfuric acid

#### Analysis

**Samples:** *Standard solutions* and *Sample solution*

Proceed as directed in the chapter. Develop the chromatogram in a chromatographic chamber (not previously saturated with the developing solvent) in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with *Spray reagent*. Dry at 105° for 15 min, and then spray in succession with sodium nitrite solution (1 in 1000), ammonium sulfamate solution (1 in 200), and N-(1-naphthyl)ethylenediamine dihydrochloride solution (1 in 1000).

**Acceptance criteria:** Any spots from the *Sample solution* are not greater in size or intensity than the spots at the respective  $R_f$  values produced by the *Standard solutions*, corresponding to NMT 3.0% of chlordiazepoxide related compound A and to NMT 0.1% of 2-amino-5-chlorobenzophenone.

##### • LIMIT OF CLIDINIUM BROMIDE RELATED COMPOUND A

**Extracting solvent mixture:** Dehydrated alcohol and cyclohexane (1:1)

**Identification solution:** Dissolve 50 mg of USP Clidinium Bromide RS in 1 mL of 0.1 N methanolic hydrochloric acid. To this solution add 20  $\mu$ L of a solution

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of  $C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O_2$  in the portion of Chlorhexidine Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of chlorhexidine from the *Sample solution*

$r_S$  = peak response of chlorhexidine from the *Standard solution*

$C_S$  = concentration of USP Chlorhexidine Acetate RS in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = concentration of Chlorhexidine Acetate in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 98.0%–101.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.15%

**Organic Impurities****• PROCEDURE**

**Solution A and Solution B:** Proceed as directed in the *Assay*.

**Diluent:** 27.6 g of monobasic sodium phosphate in 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL.

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
16	45	55
21	45	55
22	100	0
27	100	0

**Sample solution:** 2 mg/mL of Chlorhexidine Acetate in *Solution A*

**Standard solution A:** 0.06 mg/mL of Chlorhexidine Acetate in *Solution A*, from *Sample solution*

**Standard solution B:** 1.2  $\mu\text{g/mL}$  of Chlorhexidine Acetate in *Solution A*, from *Standard solution A*

**System suitability solution:** 10 mg of USP Chlorhexidine Related Compounds RS to a 10-mL volumetric flask. Dissolve in 2 mL of acetonitrile, and dilute with *Diluent* to volume.

**Chromatographic system:** Proceed as directed in the *Assay*. [NOTE—Injection size is 20  $\mu\text{L}$ .]

**System suitability**

**Sample:** *System suitability solution*

[NOTE— The relative retention times for the main related compound peak and chlorhexidine are 0.6 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** The two peaks between the main related compound peak and the chlorhexidine peak should be at least partially resolved from each other and completely resolved from the chlorhexidine peak.

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Chlorhexidine Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of chlorhexidine from *Standard solution A*

$C_S$  = concentration of chlorhexidine acetate in *Standard solution A* ( $\mu\text{g/mL}$ )

$C_U$  = concentration of Chlorhexidine Acetate in the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria**

**Total impurities:** NMT 3.0%. [NOTE— Disregard any peak less than the area of the chlorhexidine peak as obtained from *Standard solution B*.]

**SPECIFIC TESTS****• LIMIT OF *p*-CHLOROANILINE**

**Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 1.0  $\mu\text{g/mL}$  of USP *p*-Chloroaniline RS in *Solution A*

**Sample solution:** 2.0 mg/mL of Chlorhexidine Acetate in *Solution A*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria**

**Total impurities:** The *p*-chloroaniline peak area of the *Sample solution* is NMT the *p*-chloroaniline peak area in the *Standard solution* (NMT 500 ppm).

- **LOSS ON DRYING** (731): Dry a sample at 105° to constant weight: it loses NMT 3.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

- **USP REFERENCE STANDARDS** (11)

USP Chlorhexidine Acetate RS

USP Chlorhexidine Related Compounds RS

USP *p*-Chloroaniline RS

**Chlorhexidine Acetate Topical Solution****DEFINITION**

Chlorhexidine Acetate Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of chlorhexidine acetate ( $C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O_2$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak for chlorhexidine from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Acetate** (191): Meets the requirements of the lanthanum nitrate test  
**Sample:** Evaporate or dilute a volume of Topical Solution containing the equivalent of about 5 mg of chlorhexidine acetate to about 5 mL.

**ASSAY****• PROCEDURE**

**Solution A:** Dissolve 27.6 g of monobasic sodium phosphate and 10 mL of triethylamine in 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL. Prepare a mixture of the resulting solution and acetonitrile (70:30).

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
9	100	0
10	45	55
15	45	55
16	100	0
21	100	0

**System suitability solution:** 50 µg/mL of USP Chlorhexidine Acetate RS and 1 µg/mL of USP *p*-Chloroaniline RS in *Solution A*

**Standard solution:** 40 µg/mL of USP Chlorhexidine Acetate RS in *Solution A*

**Sample solution:** Nominally 40 µg/mL of chlorhexidine acetate from the Topical Solution, prepared as follows. Transfer an amount of Topical Solution, equivalent to 20 mg of chlorhexidine acetate, to a 100-mL volumetric flask, and dilute with methanol to volume. Further dilute a 10-mL portion of this solution with *Solution A* to 50 mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 50 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The approximate relative retention times for chlorhexidine and *p*-chloroaniline are about 1.0 and 1.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between chlorhexidine and *p*-chloroaniline

**Relative standard deviation:** NMT 2.0% for the chlorhexidine peak, NMT 5.0% for the *p*-chloroaniline peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{22}H_{30}Cl_2N_{10} \cdot 2C_2H_4O_2$  in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of chlorhexidine from the *Sample solution*

$r_S$  = peak area of chlorhexidine from the *Standard solution*

$C_S$  = concentration of USP Chlorhexidine Acetate RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of chlorhexidine acetate in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

## IMPURITIES

### Organic Impurities

#### • PROCEDURE: LIMIT OF *p*-CHLOROANILINE

**Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 1.0 µg/mL of USP *p*-Chloroaniline RS in *Solution A*

**Sample solution:** Nominally 2.0 mg/mL of chlorhexidine acetate from the Topical Solution, prepared as follows. Transfer an amount of Topical Solution, equivalent to 200 mg of chlorhexidine acetate, to a 100-mL volumetric flask, and dilute with *Solution A* to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** The *p*-chloroaniline peak area from the *Sample solution* is NMT the *p*-chloroaniline peak area from the *Standard solution* (NMT 500 ppm, calculated with reference to the nominal content of chlorhexidine acetate).

## SPECIFIC TESTS

### • pH <791>: 5.0–7.0

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in well-closed containers, protected from light.

### • LABELING: Label it to indicate that it is for veterinary use only.

USP Chlorhexidine Acetate RS

USP *p*-Chloroaniline RS

## Chlorhexidine Gluconate Oral Rinse

» Chlorhexidine Gluconate Oral Rinse is prepared from Chlorhexidine Gluconate Solution. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of chlorhexidine gluconate ( $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$ ).

**Packaging and storage—**Preserve in tight containers, protected from light, at controlled room temperature.

**Labeling—**Oral Rinse intended solely for veterinary use is so labeled. Oral Rinse intended for human use is labeled to indicate it is to be expectorated and not swallowed after rinsing.

### USP Reference standards <11>—

USP Chlorhexidine Acetate RS

USP *p*-Chloroaniline RS

USP Potassium Gluconate RS

### Identification—

**A:** The retention time of the major peak for chlorhexidine in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** To a volume of Oral Rinse, equivalent to about 10 mg of chlorhexidine gluconate, add 5 mL of a solution of cetyltrimethylammonium bromide (1 in 100), 1 mL of 10 N sodium hydroxide, and 1 mL of bromine TS: a deep red color is produced.

**C:** Undiluted Oral Rinse used as the test solution meets the requirements for *Identification test B* under *Calcium Gluconate*, except that a *Standard solution* containing about 0.6 mg of USP Potassium Gluconate RS per mL is used and 15 µL of the test solution and the *Standard solution* are applied to the thin-layer chromatographic plate.

**pH <791>:** between 5.0 and 7.0.

### Limit of *p*-chloroaniline—

*Solution A, Solution B, Mobile phase, Diluent, System suitability solution, and Chromatographic system—*Proceed as directed in the *Assay* under *Chlorhexidine Gluconate Solution*.

*Standard solutions—*Prepare as directed for *Standard solutions* in the test for *Limit of p-chloroaniline* under *Chlorhexidine Gluconate Solution*.

*Test solution—*Transfer 10.0 mL of Oral Rinse to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

*Procedure—*Proceed as directed in the test for *Limit of p-chloroaniline* under *Chlorhexidine Gluconate Solution*. Calculate the quantity, in µg per mL, of *p*-chloroaniline in the Oral Rinse taken by the formula:

$$2.5C.$$

The limit is 3.0 µg per mL.

### Content of alcohol—

*Internal standard solution—*Dilute 25 mL of *n*-propyl alcohol with water to 500 mL.

*Standard solution—*Transfer about 0.25 g of dehydrated alcohol, accurately weighed, to a 28-mL screw capped vial containing about 3 mL of water. Add 5.0 mL of *Internal standard solution*, and dilute with water to almost fill the

vial. Cap the vial, and using a vortex mixer, mix for 15 seconds.

**Test solution**—Transfer about 2.5 g of Oral Rinse, accurately weighed, to a 28-mL screw-capped vial. Add 5.0 mL of *Internal standard solution*, and dilute with water to almost fill the vial. Cap the vial, and using a vortex mixer, mix for 15 seconds.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm  $\times$  30-m column, the internal wall of which is coated with a 1.5- $\mu$ m film of liquid phase G27. The column is maintained at about 150° between periods of use. The injection port is equipped with a split injection port with a split ratio of 10:1. The injection port and the detector block temperatures are maintained at about 250° and 275°, respectively. At the time of use the initial column temperature is maintained at about 35° until the alcohol peaks elute, then is increased at a rate of 30° per minute to a final temperature of about 225°. The carrier gas is helium. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for alcohol and about 1.5 for *n*-propyl alcohol; the resolution, *R*, between alcohol and *n*-propyl alcohol is not less than 2; the tailing factor for the alcohol peak is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 0.5  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of alcohol (C<sub>2</sub>H<sub>5</sub>OH) in the Oral Rinse taken by the formula:

$$(W_S / W_U)(R_U / R_S)$$

in which *W<sub>S</sub>* is the weight, in g, of dehydrated alcohol taken to prepare the *Standard solution*; *W<sub>U</sub>* is the weight, in g, of Oral Rinse taken to prepare the *Test solution*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of alcohol to *n*-propyl alcohol obtained from the *Test solution* and the *Standard solution*, respectively: between 90.0% and 115.0% of the labeled amount of alcohol (C<sub>2</sub>H<sub>5</sub>OH) is found.

#### Assay—

**Diluent, Solution A, Solution B, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system**—Proceed as directed in the Assay under *Chlorhexidine Gluconate Solution*.

**Assay preparation**—Transfer 5.0 mL of Oral Rinse to a 100-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Procedure**—Proceed as directed in the Assay under *Chlorhexidine Gluconate Solution*. Calculate the percentage (w/v) of chlorhexidine gluconate (C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub> · 2C<sub>6</sub>H<sub>12</sub>O<sub>7</sub>) in the portion of Oral Rinse taken by the formula:

$$(897.76/625.55)(C/500)(r_U / r_S)$$

in which the terms are as defined therein.

### Chlorhexidine Gluconate Solution

C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub> · 2C<sub>6</sub>H<sub>12</sub>O<sub>7</sub> 897.76  
2,4,11,13-Tetraazatetradecanediimidamide, *N,N'*-bis(4-chlorophenyl)-3,12-diimino-, di-D-gluconate; 1,1'-Hexamethylenebis[5-(*p*-chlorophenyl)biguanide] di-D-gluconate [18472-51-0].

#### DEFINITION

Chlorhexidine Gluconate Solution is an aqueous solution of chlorhexidine gluconate. It contains NLT 19.0% and NMT 21.0% of C<sub>22</sub>H<sub>30</sub>Cl<sub>2</sub>N<sub>10</sub> · 2C<sub>6</sub>H<sub>12</sub>O<sub>7</sub> (w/v).

#### IDENTIFICATION

##### A. INFRARED ABSORPTION <197K>

**Standard solution:** 5 mg/mL of USP Chlorhexidine RS in 70% alcohol. Recrystallize this solution, and dry the crystals at 105° for 1 h.

**Sample solution:** To 1 mL of Solution add 40 mL of water, and cool in ice. Add 10 N sodium hydroxide, dropwise with stirring, until the solution produces a red color on thiazol yellow paper, and add 1 mL in excess. Filter, wash the precipitate with water until the washings are free from alkali, recrystallize the residue from 70% alcohol, and dry the crystals at 105° for 1 h.

##### B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

**Standard solution:** 20 mg/mL of USP Potassium Gluconate RS

**Sample solution:** Dilute 10 mL of Solution with water to 50 mL. This solution contains 40 mg/mL of chlorhexidine gluconate.

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (5:1:1:3)

**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram in a solvent system until the solvent front has moved 10 cm from the point of spotting. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for 10 min.

**Acceptance criteria:** The principal spot from the *Sample solution* corresponds in color, size, and *R<sub>f</sub>* value to that from the *Standard solution*.

#### ASSAY

##### PROCEDURE

**Diluent:** 27.6 g of monobasic sodium phosphate in 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL.

**Solution A:** Dissolve 27.6 g of monobasic sodium phosphate and 10 mL of triethylamine in 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL. Mix the resulting solution and acetonitrile (70:30).

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
9	100	0
10	45	55
15	45	55
16	100	0
21	100	0

**System suitability solution:** 50  $\mu$ g/mL of USP Chlorhexidine Acetate RS and 1  $\mu$ g/mL of USP *p*-Chloroaniline RS in *Solution A*

**Standard solution:** 50  $\mu$ g/mL of USP Chlorhexidine Acetate RS in *Solution A*

**Sample stock solution:** Transfer 5.0 mL of Solution to a 250-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 5.0 mL of the *Sample stock solution* to a 250-mL volumetric flask, and dilute with *Solution A*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC  
**Detector:** UV 239 nm  
**Column:** 4.6-mm × 25-cm; base-deactivated 5-μm packing L1  
**Column temperature:** 40°  
**Flow rate:** 1.5 mL/min  
**Injection size:** 50 μL

**System suitability**

[NOTE—The approximate relative retention times for chlorhexidine and *p*-chloroaniline are about 1.0 and 1.3, respectively.]

**Sample:** *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 3.0 between chlorhexidine and *p*-chloroaniline

**Relative standard deviation:** NMT 2.0% from the chlorhexidine peak, and NMT 5.0% from the *p*-chloroaniline peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage (w/v) of  $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$  in the portion of Solution taken:

$$\text{Result} = (r_U/r_S) \times (0.25 \times C_S) \times (M_{r1}/M_{r2})$$

$r_U$  = peak area response of chlorhexidine from the *Sample solution*

$r_S$  = peak area response of chlorhexidine from the *Standard solution*

$C_S$  = concentration of USP Chlorhexidine Acetate RS in the *Standard solution* (μg/mL)

$M_{r1}$  = molecular weight of chlorhexidine gluconate, 897.76

$M_{r2}$  = molecular weight of chlorhexidine acetate, 625.55

**Acceptance criteria:** 19.0%–21.0% (w/v)

**IMPURITIES****Organic Impurities****• PROCEDURE 1**

**Diluent, Solution A, Solution B, and Mobile phase:** Proceed as directed in the *Assay*.

**Sample stock solution:** Transfer 5.0 mL of Solution to a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 5.0 mL of the *Sample stock solution* to a 25-mL volumetric flask, and dilute with *Diluent* to volume. This solution contains 2 mg/mL of chlorhexidine gluconate.

**Reference solution A:** Transfer 3.0 mL of the *Sample solution* to a 100-mL volumetric flask, and dilute with *Diluent* to volume. This solution contains 0.06 mg/mL of chlorhexidine gluconate.

**Reference solution B:** Transfer 2.0 mL of *Reference solution A* to a 100-mL volumetric flask, and dilute with *Diluent* to volume. This solution contains 0.0012 mg/mL of chlorhexidine gluconate.

**System suitability solution:** Transfer 10 mg of USP Chlorhexidine Related Compounds RS to a 10-mL volumetric flask. Dissolve in 2 mL of acetonitrile, and dilute with *Diluent* to volume.

**Chromatographic system:** Proceed as directed in the *Assay*, except the *Injection size* and chromatograph are programmed as shown in the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
16	45	55
21	45	55
22	100	0
27	100	0

**Injection size:** 20 μL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for the main related compound peak and chlorhexidine are 0.6 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** The two peaks between the main related compound peak and the chlorhexidine peak should be at least partially resolved from each other and completely resolved from the chlorhexidine peak.

**Analysis**

**Samples:** *Sample solution*, *Reference solution A*, and *Reference solution B*

Examine the chromatogram from the *Sample solution*.

**Acceptance criteria:** The sum of the peak areas, other than chlorhexidine and any peak areas less than that obtained for chlorhexidine in the chromatogram from *Reference solution B*, is NMT the peak area for chlorhexidine in the chromatogram from *Reference solution A* (3.0%).

**• PROCEDURE 2: LIMIT OF *p*-CHLOROANILINE**

**Diluent, Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 1.0 μg/mL of USP *p*-Chloroaniline RS in *Diluent*

**Sample stock solution:** Transfer 5.0 mL of Solution to a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 10.0 mL of *Sample stock solution* to a 250-mL volumetric flask, and dilute with *Diluent* to volume. This solution contains 0.4 mg/mL of chlorhexidine gluconate.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Acceptance criteria:** NMT 500 μg/mL

The *p*-chloroaniline peak area response of the *Sample solution* is NMT the *p*-chloroaniline peak area response of the *Standard solution*.

**SPECIFIC TESTS**

**• SPECIFIC GRAVITY (841):** 1.06–1.07

**• PH (791):** 5.5–7.0, when diluted 1 in 20 with water

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Preserve in tight containers, protected from light, at controlled room temperature.

## Chlorhexidine Gluconate Topical Solution

**DEFINITION**

Chlorhexidine Gluconate Topical Solution is prepared from Chlorhexidine Gluconate Solution. It contains NLT 90.0% and NMT 110.0% of the labeled amount of chlorhexidine gluconate ( $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$ ).

**IDENTIFICATION**

**• A.** The retention time of the major peak for chlorhexidine from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**• B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Standard solution:** 10 mg/mL of USP Potassium Gluconate RS

**Sample solution:** Nominally 20 mg/mL of chlorhexidine gluconate from the Topical Solution

**Adsorbent:** 0.25-mm layer of chromatographic silica gel

**Application volume:** 10  $\mu$ L

**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (5:1:1:3)

**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask. Add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Develop the chromatogram in a solvent system until the solvent front has moved 10 cm from the point of spotting. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with *Spray reagent*. Heat the plate at 110° for 10 min.

**Acceptance criteria:** The principal spot from the *Sample solution* corresponds in color, size, and  $R_f$  value to that from the *Standard solution*.

## ASSAY

### • PROCEDURE

**Solution A:** Dissolve 27.6 g of monobasic sodium phosphate and 10 mL of triethylamine in 1.5 L of water. Adjust with phosphoric acid to a pH of 3.0, and dilute with water to 2000 mL. Prepare a mixture of the resulting solution and acetonitrile (70:30).

**Solution B:** Acetonitrile

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
9	100	0
10	45	55
15	45	55
16	100	0
21	100	0

**System suitability solution:** 50  $\mu$ g/mL of USP Chlorhexidine Acetate RS and 1  $\mu$ g/mL of USP *p*-Chloroaniline RS in *Solution A*

**Standard solution:** 50  $\mu$ g/mL of USP Chlorhexidine Acetate RS in *Solution A*.

**Sample solution:** Nominally about 80  $\mu$ g/mL of chlorhexidine gluconate from the Topical Solution, prepared as follows. Transfer an amount of Topical Solution, equivalent to 40 mg of chlorhexidine gluconate, to a 100-mL volumetric flask, and dilute with methanol to volume. Further dilute a 10-mL portion of this solution with *Solution A* to 50 mL.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 239 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 50  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The approximate relative retention times for chlorhexidine and *p*-chloroaniline are about 1.0 and 1.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between chlorhexidine and *p*-chloroaniline

**Relative standard deviation:** NMT 2.0% for the chlorhexidine peak, NMT 5.0% for the *p*-chloroaniline peak

## Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{22}H_{30}Cl_2N_{10} \cdot 2C_6H_{12}O_7$  in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak area of chlorhexidine from the *Sample solution*

$r_S$  = peak area of chlorhexidine from the *Standard solution*

$C_S$  = concentration of USP Chlorhexidine Acetate RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of chlorhexidine gluconate in the *Sample solution* ( $\mu$ g/mL)

$M_{r1}$  = molecular weight of chlorhexidine gluconate, 897.76

$M_{r2}$  = molecular weight of chlorhexidine acetate, 625.55

**Acceptance criteria:** 90.0%–110.0%

## IMPURITIES

### Organic Impurities

#### • PROCEDURE: LIMIT OF *p*-CHLOROANILINE

**Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** 1.0  $\mu$ g/mL of USP *p*-Chloroaniline RS in *Solution A*

**Sample solution:** Nominally 0.4 mg/mL of chlorhexidine gluconate from the Topical Solution, prepared as follows. Transfer an amount of Topical Solution, equivalent to 40 mg of chlorhexidine gluconate, to a 100-mL volumetric flask, and dilute with *Solution A* to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

#### Acceptance criteria

The *p*-chloroaniline peak area from the *Sample solution* is NMT the *p*-chloroaniline peak area from the *Standard solution* (equivalent to NMT 500 ppm in the portion of Chlorhexidine Gluconate Solution used to prepare the Topical Solution).

## SPECIFIC TESTS

• **pH** <791>: 5.0–7.0

## ADDITIONAL REQUIREMENTS

**Chlorophyllin Copper Complex Sodium****DEFINITION**

Chlorophyllin Copper Complex Sodium contains sodium salts of copper-chelated chlorophyll derivatives. It contains no artificial coloring.

**IDENTIFICATION**

- **A. SPECTROPHOTOMETRY AND LIGHT-SCATTERING (851)** (in the visible region)

**Sample solution:** 10 µg/mL

**Medium:** pH 7.5 phosphate buffer, prepared by mixing 0.15 M dibasic sodium phosphate and 0.15 M monobasic potassium phosphate (21:4)

**Acceptance criteria:** The ratio of  $A_{405}/A_{630}$  is 3.0–3.9.

**OTHER COMPONENTS**• **CONTENT OF TOTAL COPPER**

**Stock solution 1:** 1000 µg/mL of copper. Transfer 1.000 g of copper to a 1000-mL volumetric flask, dissolve in 20 mL of nitric acid, and dilute with 0.2 N nitric acid to volume. [NOTE—Store in a polyethylene bottle.]

**Stock solution 2:** 10 µg/mL of copper. Transfer 5.0 mL of *Stock solution 1* into a 500-mL volumetric flask, and dilute with water to volume.

**Standard solutions:** Transfer 5.0, 10.0, 15.0, and 20.0 mL, respectively, of *Stock solution 2* to separate 100-mL volumetric flasks, and dilute the contents of each flask with water to volume. These *Standard solutions* contain 0.5, 1.0, 1.5, and 2.0 µg/mL of copper, respectively.

**Sample solution:** Transfer 100 mg of previously dried Chlorophyllin Copper Complex Sodium to a Kjeldahl flask. Add 2.0 mL of sulfuric acid, 1.0 mL of nitric acid, and 1.0 mL of hydrogen peroxide, and carefully heat under a fume hood until a light green color is obtained. [NOTE—If the solution has any hint of a brown tint, continue to add 0.5-mL portions of nitric acid until a green color is obtained.] Cool, transfer the contents quantitatively to a 1000-mL volumetric flask with several portions of water, dilute the contents of the flask with water to volume, and mix. Transfer 10.0 mL of this

solution to a 50-mL volumetric flask, and dilute with water to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometry

**Lamp:** Copper hollow-cathode

**Flame:** Air–acetylene

**Analytical wavelength:** Copper emission line of 324.8 nm

**Blank:** Water

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*

Determine the absorbances of the *Standard solutions* and the *Sample solution*. Plot the absorbances of the *Standard solutions* versus the concentration, in µg/mL, of copper, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of copper in the *Sample solution*.

Calculate the percentage of copper in the portion of Chlorophyllin Copper Complex Sodium taken:

$$\text{Result} = (C/W) \times (V/F) \times 100$$

*C* = concentration of the *Sample solution* determined from the graph (µg/mL)

*W* = weight of Chlorophyllin Copper Complex Sodium taken to prepare the *Sample solution* (mg)

*V* = final volume of *Sample solution*, 5000 mL

*F* = conversion factor, 1000 µg/mg

**Acceptance criteria:** NLT 4.25% on the dried basis

• **CONTENT OF CHELATED COPPER**

**Analysis:** Calculate the percentage of chelated copper in the portion of Chlorophyllin Copper Complex Sodium taken by subtracting the percentage of ionic copper found in the test for *Limit of Ionic Copper* from the percentage of total copper found in the test for *Content of Total Copper*.

**Acceptance criteria:** NLT 4.0% on the dried basis

• **CONTENT OF SODIUM**

**Standard stock solution:** 100 µg/mL of sodium. Dissolve 254.2 mg of sodium chloride, previously dried at 105° for 2 h, in 50 mL of water. Transfer to a 1000-mL volumetric flask, and dilute with water to volume.

**Standard solutions:** Transfer to each of four 100-mL volumetric flasks 10 mL of a nonionic wetting agent solution (1 in 500). To each flask add, respectively, 2.5, 5.0, 10.0, and 15.0 mL of the *Standard stock solution*, and dilute with water to volume. These *Standard solutions* contain 2.5, 5.0, 10.0, and 15.0 µg/mL of sodium, respectively.

**Blank:** Transfer 10 mL of a nonionic wetting agent solution (1 in 500) into a 100-mL volumetric flask, and dilute with water to volume.

**Sample solution:** Transfer 100 mg of Chlorophyllin Copper Complex Sodium to a 1000-mL volumetric flask. Add 100 mL of a solution of nonionic wetting agent (1 in 500) and 400 mL of water, and shake by mechanical means for 5 min. Dilute with water to volume.

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*

Set the flame photometer for maximum transmission at a wavelength of 589 nm. Adjust the instrument to zero transmittance with the *Blank*. Adjust the instrument to 100% transmittance with the most concentrated of the *Standard solutions*. Read the percentage of transmittance of the other *Standard solutions*, and plot the percentage of transmittance versus the concentration, in µg/mL, of sodium. Read the percentage of transmittance of the *Sample solution*, and from the graph read the concentration, *C*, in µg/mL, of sodium in the *Sample solution*.

Calculate the percentage of sodium in the portion of Chlorophyllin Copper Complex Sodium taken:

$$\text{Result} = (C/W) \times (V/F) \times 100$$

- $C$  = concentration of the *Sample solution* determined from the graph ( $\mu\text{g/mL}$ )  
 $W$  = weight of Chlorophyllin Copper Complex Sodium taken to prepare the *Sample solution* (mg)  
 $V$  = volume of *Sample solution*, 1000 mL  
 $F$  = conversion factor, 1000  $\mu\text{g/mg}$

Acceptance criteria: 5%–7% on the dried basis

- **NITROGEN DETERMINATION**, *Method I* (461): NLT 4.0%

## IMPURITIES

### • LIMIT OF IONIC COPPER

**Standard solutions:** Prepare as directed in the test for *Content of Total Copper*.

**Sample solution:** Transfer 100 mg of Chlorophyllin Copper Complex Sodium to a 150-mL conical flask. Add 75 mL of water, and shake by mechanical means for 3 min. Adjust with 1 N hydrochloric acid to a pH of 3.0, transfer the suspension thus obtained to a 100-mL volumetric flask, and dilute with water to volume. Filter this suspension, discarding the first 10 mL of the filtrate. Use the clear filtrate for analysis.

### Analysis

**Samples:** *Standard solutions* and *Sample solution*  
 Proceed as directed in the test for *Content of Total Copper*.

Calculate the percentage of ionic copper in the portion of Chlorophyllin Copper Complex Sodium taken:

$$\text{Result} = (C/W) \times (V/F) \times 100$$

- $C$  = concentration of the *Sample solution* determined from the graph ( $\mu\text{g/mL}$ )  
 $W$  = weight of Chlorophyllin Copper Complex Sodium taken to prepare the *Sample solution* (in mg on the dried basis)  
 $V$  = volume of *Sample solution*, 100 mL  
 $F$  = conversion factor, 1000  $\mu\text{g/mg}$

Acceptance criteria: NMT 0.25% on the dried basis

- **RESIDUE ON IGNITION** (281): NMT 30% on the dried basis
- **ARSENIC**, *Method II* (211): NMT 3 ppm
- **LEAD** (251): NMT 10 ppm
- **IRON** (241): NMT 0.50%

## SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the tests for absence of *Escherichia coli* and *Salmonella* species.
- **pH** (791): 9.5–10.7, in a solution (1 in 100)
- **LOSS ON DRYING** (731): Dry a sample at 150° for 2 h: it loses NMT 5% of its weight.
- **TEST FOR FLUORESCENCE**  
**Sample solution:** 10 mg/mL  
**Analysis:** Apply 10  $\mu\text{L}$  of *Sample solution* on filter paper, allow to dry, and examine the area of application under long-wavelength UV light through a red optical filter.  
**Acceptance criteria:** No fluorescence is visible.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

## Chloroprocaine Hydrochloride

$\text{C}_{13}\text{H}_{19}\text{ClN}_2\text{O}_2 \cdot \text{HCl}$  307.22

Benzoic acid, 4-amino-2-chloro-, 2-(diethylamino)ethyl ester, monohydrochloride.

2-(Diethylamino)ethyl 4-amino-2-chlorobenzoate monohydrochloride [3858-89-7].

» Chloroprocaine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{13}\text{H}_{19}\text{ClN}_2\text{O}_2 \cdot \text{HCl}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
 USP Chloroprocaine Hydrochloride RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10  $\mu\text{g}$  per mL.

*Medium:* pH 4.5 buffer solution [prepared by dissolving 13.61 g of monobasic potassium phosphate in 750 mL of water, adjusting to a pH of  $4.5 \pm 0.1$  with potassium hydroxide solution (1 in 180) and diluting with water to 1000 mL]. Absorptivities at 290 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** It meets the requirements of the tests for *Chloride* (191).

**Melting range**, *Class I* (741): between 173° and 176°.

**Acidity**—Dissolve 1.0 g in 25 mL of water, add 2 drops of methyl red TS, and titrate with 0.020 N sodium hydroxide: not more than 1.8 mL is required to produce a yellow color.

**Loss on drying** (731)—Dry about 500 mg, accurately weighed, at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

### Related compounds—

**4-Amino-2-chlorobenzoic acid**—Using the chromatograms obtained as directed for the *Assay*, calculate the percentage of 4-amino-2-chlorobenzoic acid ( $\text{C}_7\text{H}_6\text{ClNO}_2$ ) in the Chloroprocaine Hydrochloride taken by the formula:

$$10,000(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of 4-amino-2-chlorobenzoic acid in the *Standard preparation*;  $W$  is the quantity, in mg, of Chloroprocaine Hydrochloride taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the 4-amino-2-chlorobenzoic acid peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 0.625% is found.

### Assay—

**Mobile phase**—Dissolve 800 mg of sodium 1-heptanesulfonate in 740 mL of water, add 200 mL of acetonitrile, 50 mL of methanol, and 10 mL of glacial acetic acid, and mix. Filter and degas this solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard 4-amino-2-chlorobenzoic acid solution**—Dissolve an accurately weighed quantity of recrystallized 4-amino-2-chlorobenzoic acid in methanol to obtain a solution having a known concentration of about 0.2 mg per mL.

**Standard preparation**—Transfer about 50 mg of USP Chloroprocaine Hydrochloride RS, accurately weighed, to a

50-mL volumetric flask containing 5.0 mL of *Standard 4-amino-2-chlorobenzoic acid solution*, add 15 mL of methanol, swirl to dissolve, dilute with water to volume, and mix. This solution contains about 1 mg of USP Chlorprocaine Hydrochloride RS and 0.02 mg of 4-amino-2-chlorobenzoic acid per mL.

**System suitability solution**—Mix equal volumes of *Standard 4-amino-2-chlorobenzoic acid solution* and *Standard preparation*.

**Assay preparation**—Transfer about 100 mg of Chlorprocaine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in 40 mL of methanol, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 278-nm detector and a 3.9-mm × 30-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.35 for 4-amino-2-chlorobenzoic acid and 1.0 for chlorprocaine; and the resolution,  $R_s$ , between 4-amino-2-chlorobenzoic acid and chlorprocaine is not less than 5.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative standard deviation determined from chlorprocaine obtained from replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for 4-amino-2-chlorobenzoic acid and chlorprocaine. Calculate the quantity, in mg, of  $C_{13}H_{19}ClN_2O_2 \cdot HCl$  in the portion of Chlorprocaine Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chlorprocaine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the chlorprocaine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorprocaine Hydrochloride Injection

» Chlorprocaine Hydrochloride Injection is a sterile solution of Chlorprocaine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of chlorprocaine hydrochloride ( $C_{13}H_{19}ClN_2O_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** <11>—  
USP Chlorprocaine Hydrochloride RS

**Identification**—Dissolve 60 mg of USP Chlorprocaine Hydrochloride RS in 10 mL of water in a 60-mL separator, and in a second 60-mL separator mix a volume of Injection, equivalent to 60 mg of chlorprocaine hydrochloride, with sufficient water to obtain 10 mL of solution. Add 5 mL of dilute ammonium hydroxide (4 in 10) to each, mix, and immediately extract each with four 10-mL portions of chloroform, passing the extracts from the Reference Standard and the test specimen through cotton filters into separate 50-mL volumetric flasks. Dilute each with chloroform to volume, and mix. Add a mixture of chloroform and methanol (4:1) to a suitable chromatographic chamber arranged for thin-layer chromatography (see *Chromatography* <621>),

cover the chamber, and allow the system to equilibrate for 15 minutes. Apply separately 10-µL portions of the chloroform solutions obtained from the Reference Standard and the test specimen to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution ( $R_f$  about 0.40). After viewing, spray the chromatogram with iodoplatinate TS: violet-blue colored spots, characteristic of tertiary nitrogen compounds, are visible.

**pH** <791>: between 2.7 and 4.0.

### Related compounds—

**4-Amino-2-chlorobenzoic acid**—Using the chromatograms obtained as directed for the *Assay*, calculate the percentage of 4-amino-2-chlorobenzoic acid ( $C_7H_6ClNO_2$ ) in the chlorprocaine hydrochloride contained in the Injection taken by the formula:

$$10,000(C / W_o)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of 4-amino-2-chlorobenzoic acid in the *Standard preparation*;  $W_o$  is the quantity, in mg, of chlorprocaine hydrochloride in the portion of Injection taken to prepare the *Assay preparation*, determined as directed in the *Assay preparation*; and  $r_U$  and  $r_S$  are the 4-amino-2-chlorobenzoic acid peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 3.0% is found.

**Other requirements**—It meets the requirements under *Injections* <1>.

### Assay—

**Mobile phase**, *Standard 4-amino-2-chlorobenzoic acid solution*, *Standard preparation*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay under Chlorprocaine Hydrochloride*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of chlorprocaine hydrochloride, to a 100-mL volumetric flask, add 40 mL of methanol, dilute with water to volume, and mix.

**Procedure**—Proceed as directed in the *Assay under Chlorprocaine Hydrochloride*. Calculate the quantity, in mg, of chlorprocaine hydrochloride ( $C_{13}H_{19}ClN_2O_2 \cdot HCl$ ) in each mL of the Injection taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of Injection taken, and the other terms are as defined therein.

## Chloroquine

$C_{18}H_{26}ClN_3$  319.87  
1,4-Pentanediamine,  $N^4$ -(7-chloro-4-quinolinyl)- $N^1,N^1$ -diethyl-;  
7-Chloro-4-[[4-(diethylamino)-1-methylbutyl]amino]quinoline [54-05-7].

**DEFINITION**

Chloroquine contains NLT 98.0% and NMT 102.0% of chloroquine ( $C_{18}H_{26}ClN_3$ ), calculated on the dried basis.

**IDENTIFICATION**

- A. IDENTIFICATION—ORGANIC NITROGENOUS BASES (181)**

**Standard solution:** Proceed as directed in the chapter except use chloroform instead of carbon disulfide in the test.

**Sample solution:** 8.75 mg/mL of chloroquine prepared as follows. Dissolve 35 mg of Chloroquine in 4 mL of chloroform. Pass through a dry filter.

**Analysis:** Determine the absorption of the *Standard solution* and *Sample solution* without delay in 1-mm cells between 7 and 15  $\mu$ m, using chloroform in a matched cell as a blank.

**Acceptance criteria:** The IR absorption spectrum of the *Sample solution* so obtained exhibits maxima only at the same wavelengths as that of the *Standard solution*.

- B. ULTRAVIOLET ABSORPTION (197U)**

**Medium:** Dilute hydrochloric acid (1 in 1000)

**Sample solution:** 10  $\mu$ g/mL

**Acceptance criteria:** The ratio  $A_{343}/A_{329}$  is 1.00–1.15.

**ASSAY**

- PROCEDURE**

**Sample solution:** Dissolve 250 mg of Chloroquine in 50 mL of glacial acetic acid. Add crystal violet TS.

**Analysis:** Titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 15.99 mg of chloroquine ( $C_{18}H_{26}ClN_3$ ).

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

- RESIDUE ON IGNITION (281):** NMT 0.2%

**SPECIFIC TESTS**

- MELTING RANGE OR TEMPERATURE (741):** 87°–92°

- LOSS ON DRYING (731)**

**Analysis:** Dry a sample at 105° for 2 h.

**Acceptance criteria:** NMT 2.0%

**ADDITIONAL REQUIREMENTS**

- PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

- USP REFERENCE STANDARDS (11)**

USP Chloroquine Phosphate RS

## Chloroquine Hydrochloride Injection

$C_{18}H_{26}ClN_3 \cdot 2HCl$  392.79

1,4-Pentanediamine, *N*-(7-chloro-4-quinolinyl)-*N*′, *N*′-diethyl-, dihydrochloride;

7-(Chloro-4-[[4-diethylamino]-1-methylbutyl]amino]quinoline dihydrochloride [3545-67-3].

**DEFINITION**

Chloroquine Hydrochloride Injection is a sterile solution of Chloroquine in Water for Injection prepared with the aid of Hydrochloric Acid. It contains NLT 47.5 mg and NMT 52.5 mg of chloroquine hydrochloride ( $C_{18}H_{26}ClN_3 \cdot 2HCl$ ) in each mL.

**IDENTIFICATION**

- A. ULTRAVIOLET ABSORPTION**

**Sample solution:** Prepare as directed in the Assay.

**Standard solution:** 7.5  $\mu$ g/mL of USP Chloroquine Phosphate RS prepared similarly to the *Sample solution*

**Instrumental conditions**

**Mode:** UV

**Wavelength range:** 329–343 nm

**Analysis**

**Samples:** *Sample solution* and *Standard solution*

Calculate the absorbance ratio:

$$\text{Result} = A_{343}/A_{329}$$

$A_{343}$  = absorbance of the *Sample solution* at 343 nm

$A_{329}$  = absorbance of the *Sample solution* at 329 nm

**Acceptance criteria:** The peak maxima and minima of the *Sample solution* correspond to those of the *Standard solution*; the absorbance ratio is 1.00–1.15.

- B.**

**Sample solution:** 20 mL of a 1-mg/mL solution of chloroquine hydrochloride from Injection, diluted with water

**Analysis 1:** To the *Sample solution* add 5 mL of trinitrophenol TS.

**Acceptance criteria 1:** A yellow precipitate is formed.

**Analysis 2:** Filter, wash the precipitate with water until the last washing is colorless, and dry over silica gel.

[CAUTION—Picrates may explode.]

**Acceptance criteria 2:** The precipitate melts at 205°–210°.

- C. IDENTIFICATION TESTS—GENERAL, Chloride (191):** Meets the requirements

**ASSAY**

- PROCEDURE**

**Diluent 1:** Dilute hydrochloric acid (1 in 100)

**Diluent 2:** Dilute hydrochloric acid (1 in 1000)

**Standard solution:** 10  $\mu$ g/mL of USP Chloroquine Phosphate RS in *Diluent 2*

**Sample stock solution:** 150  $\mu$ g/mL of chloroquine hydrochloride prepared as follows. Transfer a volume of Injection, nominally 150 mg of chloroquine hydrochloride, to a 1-L volumetric flask, and dilute with water to volume.

**Sample solution:** 7.5  $\mu$ g/mL of chloroquine hydrochloride prepared as follows. Transfer 5.0 mL of the *Sample stock solution* to a 100.0-mL volumetric flask, add 10.0 mL of *Diluent 1*, and dilute with water to volume.

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** Maxima at about 343 nm

**Blank:** Water

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration, in mg/mL, of chloroquine hydrochloride ( $C_{18}H_{26}ClN_3 \cdot 2HCl$ ) in the portion of Injection taken:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times (V/V_i) \times (M_{r1}/M_{r2})$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Chloroquine Phosphate RS in the *Standard solution* (mg/mL)

$D$  = dilution factor for the preparation of the *Sample solution*, 20

$V$  = volume of the *Sample stock solution*, 1000 mL

$V_i$  = volume of Injection taken for the *Sample stock solution* (mL)

$M_{r1}$  = molecular weight of chloroquine hydrochloride, 392.79

$M_{r2}$  = molecular weight of chloroquine phosphate, 515.86

**Acceptance criteria:** 47.5–52.5 mg/mL

**SPECIFIC TESTS**

- pH (791):** 5.5–6.5

- BACTERIAL ENDOTOXINS TEST (85):** It contains NMT 0.7 USP Endotoxin Unit/mg of chloroquine hydrochloride.

- **OTHER REQUIREMENTS:** It meets the requirements in *Injections* <1>.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in single-dose containers, preferably of Type I glass.
- **USP REFERENCE STANDARDS** <11>  
USP Chloroquine Phosphate RS  
USP Endotoxin RS

### Chloroquine Phosphate

$C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$  515.86

1,4-Pentanediamine, *N*-(7-chloro-4-quinolinyl)-*N*′, *N*′-diethyl-, phosphate (1:2).

7-Chloro-4-[[4-(diethylamino)-1-methylbutyl]amino]quinoline phosphate (1:2) [50-63-5].

» Chloroquine Phosphate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Chloroquine Phosphate RS

USP Hydroxychloroquine Sulfate RS

#### Identification—

**A:** It meets the requirements under *Identification—Organic Nitrogenous Bases* <181>, chloroform being substituted for carbon disulfide in the test.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 10 µg per mL.

*Medium:* dilute hydrochloric acid (1 in 1000).

*Ratio:*  $A_{343}/A_{329}$ , between 1.00 and 1.15.

**C:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** <731>—Dry it at 105° for 16 hours: it loses not more than 2.0% of its weight.

#### Assay—

**Buffer solution**—Accurately weigh about 13.6 g of monobasic potassium phosphate, and dissolve in 2 L of water. Add 2.0 mL perchloric acid, mix, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.5$ . Pass the solution through a membrane filter having a 0.45-µm porosity.

**Mobile phase**—Prepare a mixture of *Buffer solution* and methanol (78:22). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Transfer an accurately weighed quantity of USP Chloroquine Phosphate RS to a suitable volumetric flask, and dissolve in and dilute with water to volume to obtain a solution having a concentration of about 0.15 mg per mL of chloroquine phosphate.

**Assay preparation**—Transfer an accurately weighed quantity of Chloroquine Phosphate to a suitable volumetric flask, and dissolve in and dilute with water to volume to obtain a solution having a concentration of about 0.15 mg per mL of chloroquine phosphate.

**System suitability solution**—Transfer accurately weighed quantities of USP Hydroxychloroquine Sulfate RS and USP Chloroquine Phosphate RS to a suitable volumetric flask, and dissolve in and dilute with water to volume to obtain a solution having concentrations of about 0.015 mg per mL of hydroxychloroquine sulfate and 0.15 mg per mL of chloroquine phosphate.

**Chromatography system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 224-nm detector and a 4.6-mm × 10-cm column that contains 5-µm packing L1. The flow rate is about 1.2 mL per minute. The column temperature is maintained at  $25 \pm 5^\circ$ . Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are 1.0 for chloroquine phosphate and 0.8 for hydroxychloroquine sulfate; the resolution, *R*, between chloroquine phosphate and hydroxychloroquine sulfate is not less than 1.5; the column efficiency is not less than 2000 theoretical plates; for both compounds, the tailing factor is not more than 2.0; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$  in the portion of Chloroquine Phosphate taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which 100 is the percent conversion factor;  $C_S$  is the concentration, in mg per mL, of USP Chloroquine Phosphate RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of Chloroquine Phosphate in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Add the following:

### ▲Chloroquine Phosphate Oral Suspension

#### DEFINITION

Chloroquine Phosphate Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of chloroquine phosphate ( $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ ).

Prepare Chloroquine Phosphate Oral Suspension 15 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Chloroquine Phosphate tablets <sup>a</sup>	1.5 g
Vehicle: a 1:1 mixture of Ora-Sweet <sup>b</sup> and Ora-Plus <sup>b</sup> , a sufficient quantity to make	100 mL

<sup>a</sup> Aralen 500-mg tablets, Sanofi-Winthrop, NY.

<sup>b</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a chloroquine phosphate liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

#### ASSAY

##### • PROCEDURE

**Buffer solution:** 20 mM 1-heptanesulfonic acid adjusted to a pH of 3.4

**Mobile phase:** Acetonitrile and *Buffer solution* (34:66). Filter and degas.

**Standard solution:** 150 µg/mL of USP Chloroquine Phosphate RS in *Mobile phase*

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Pipet 1.0 mL of the Oral Suspension

into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 340 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for chloroquine phosphate is about 9.4 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 2% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of chloroquine phosphate ( $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of chloroquine phosphate in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of chloroquine phosphate in the *Sample solution* (μg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### SPECIFIC TESTS

- **PH** <791>: 4.0–5.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or controlled cold temperature.
- **LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded when stored at controlled cold temperature or controlled room temperature
- **USP REFERENCE STANDARDS** <11>  
USP Chloroquine Phosphate RS ▲<sub>USP36</sub>

## Chloroquine Phosphate Tablets

#### DEFINITION

Chloroquine Phosphate Tablets contain NLT 93.0% and NMT 107.0% of the labeled amount of chloroquine phosphate ( $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ ).

#### IDENTIFICATION

##### • A. ULTRAVIOLET ABSORPTION

**Standard solution:** 7.5 μg/mL of USP Chloroquine Phosphate RS in water

**Sample solution:** Nominally 7.5 μg/mL of chloroquine phosphate from a filtered solution of finely powdered Tablets in water

#### Instrumental conditions

**Mode:** UV

**Wavelength range:** 329–343 nm

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the absorbance ratio:

$$\text{Result} = A_{343}/A_{329}$$

$A_{343}$  = absorbance of the *Sample solution* at 343 nm

$A_{329}$  = absorbance of the *Sample solution* at 329 nm

**Acceptance criteria:** The peak maxima and minima of the *Sample solution* correspond to those of the *Standard solution*; the absorbance ratio is 1.00–1.15.

##### • B.

**Sample solution:** 20 mL of a filtered 1-mg/mL chloroquine phosphate solution from finely powdered Tablets in water

**Analysis 1:** To the *Sample solution* add 5 mL of trinitrophenol TS.

**Acceptance criteria 1:** A yellow precipitate is formed.

**Analysis 2:** Filter, wash the precipitate with water until the last washing is colorless, and dry over silica gel.

[CAUTION—Picrates may explode.]

**Acceptance criteria 2:** The precipitate melts at 205°–210°.

##### • C.

The retention time of the chloroquine peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### • PROCEDURE

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Add 1.0 mL of perchloric acid to each 1 L of solution, adjust with phosphoric acid to a pH of 2.5, and pass through a filter of 0.45-μm pore size.

**Mobile phase:** Methanol and *Buffer* (22:78)

**System suitability solution:** 0.15 mg/mL of USP Amodiaquine Hydrochloride RS and 0.15 mg/mL of USP Chloroquine Phosphate RS in water

**Standard solution:** 0.15 mg/mL of USP Chloroquine Phosphate RS in water

**Sample solution:** Nominally 0.15 mg/mL of chloroquine phosphate in water prepared as follows. Transfer nominally 7.5 mg of chloroquine phosphate from finely powdered Tablets (NLT 20) to a 50-mL volumetric flask, and dissolve in and dilute with water to volume. Sonicate for 20 min. Pass 10 mL through a nylon filter of 0.2-μm pore size, discarding the first 4 mL, and use 2 mL for the *Analysis*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 224 nm

**Column:** 4.6-mm × 10-cm; 5-μm packing L1

**Flow rate:** 1.2 mL/min

**Injection volume:** 10 μL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for chloroquine phosphate and amodiaquine hydrochloride are 1.0 and 1.3, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between amodiaquine hydrochloride and chloroquine phosphate

**Tailing factor:** NMT 1.5 for the amodiaquine and chloroquine peaks

**Relative standard deviation:** NMT 2.0% for the amodiaquine and chloroquine peaks

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of chloroquine phosphate ( $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Chloroquine Phosphate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of chloroquine phosphate in the *Sample solution* (mg/mL)

Acceptance criteria: 93.0%–107.0%

## PERFORMANCE TESTS

- **DISSOLUTION** (711)  
 Medium: Water; 900 mL  
 Apparatus 2: 100 rpm  
 Time: 45 min  
 Detector: UV  
 Analytical wavelength: 343 nm  
 Standard solution: USP Chloroquine Phosphate RS in Medium  
 Sample solution: Dilute with Medium to a concentration that is similar to the Standard solution.  
 Tolerances: NLT 75% (Q) of the labeled amount of chloroquine phosphate ( $C_{18}H_{26}ClN_3 \cdot 2H_3PO_4$ ) is dissolved.
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Amodiaquine Hydrochloride RS  
 USP Chloroquine Phosphate RS

## Chlorothiazide

$C_7H_6ClN_3O_4S_2$  295.72  
 2 *H*-1,2,4-Benzothiadiazine-7-sulfonamide, 6-chloro-, 1,1-dioxide.  
 6-Chloro-2 *H*-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide [58-94-6].

» Chlorothiazide contains not less than 98.0 percent and not more than 102.0 percent of  $C_7H_6ClN_3O_4S_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Benzothiadiazine Related Compound A RS  
 4-Amino-6-chloro-1,3-benzenedisulfonamide.  
 $C_6H_8ClN_3O_4S_2$  285.73  
 USP Chlorothiazide RS

### Identification—

**A:** *Infrared Absorption* (197M): previously dried at 105° for 1 hour.

**B:** *Ultraviolet Absorption* (197U)—

Solution: 10 µg per mL.

Medium: sodium hydroxide solution (1 in 250).

Absorptivities at 292 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Loss on drying** (731)—Dry it at 105° for 1 hour: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chloride**—Dissolve 1.00 g in a mixture of 10 mL of water and 10 mL of sodium hydroxide solution (1 in 10). Cool in an ice bath, and add 20 mL of water and 5 mL of nitric acid. A flocculent, white precipitate is formed. Titrate potentiometrically with 0.050 N silver nitrate, using a silver–silver chloride electrode system: not more than 0.28 mL is required (0.05%).

**Selenium** (291): 0.003%.

**Heavy metals**, Method II (231): 0.001%.

### Related compounds—

*Mobile phase*, *Resolution solution*, and *Chromatographic system*—Proceed as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of USP Benzothiadiazine Related Compound A RS in *Mobile phase* to obtain a solution having a known concentration of about 1.5 µg per mL.

*Test solution*—Proceed as directed for Assay preparation in the Assay.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.9 for benzothiadiazine related compound A and 1.0 for chlorothiazide. Calculate the quantity, in mg, of benzothiadiazine related compound A in the portion of Chlorothiazide taken by the formula:

$$0.2C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Benzothiadiazine Related Compound A RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses of benzothiadiazine related compound A obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% is present.

### Assay—

*Mobile phase*—Prepare a suitable degassed mixture of 0.1 M monobasic sodium phosphate and acetonitrile (9:1), adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Resolution solution*—Dissolve quantities of USP Reference Standards in *Mobile phase* to obtain solutions having known concentrations of about 0.15 mg per mL of USP Chlorothiazide RS and about 1.5 µg per mL of USP Benzothiadiazine Related Compound A RS.

*Standard preparation*—[NOTE—A volume of acetonitrile not exceeding 10% of the total volume of solution may be used to dissolve the reference standard.] Dissolve an accurately weighed quantity of USP Chlorothiazide RS in *Mobile phase* to obtain a solution having a known concentration of about 0.15 mg per mL.

*Assay preparation*—Transfer about 30 mg of Chlorothiazide, accurately weighed, to a 200-mL volumetric flask, dissolve in a small volume of acetonitrile, not exceeding 10% of the total volume of the solution, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 1.5%. Chromatograph the *Resolution solution*: the resolution, *R*, between benzothiadiazine related compound A and chlorothiazide is not less than 3.5.

*Procedure*—[NOTE—The *Standard preparation* and the *Assay preparation* should be injected immediately upon preparation.] Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major chlorothiazide peaks. The relative retention times are about 0.9 for benzothiadiazine related compound A and 1.0 for chlorothiazide. Calculate the

quantity, in mg, of  $C_7H_6ClN_3O_4S_2$  in the portion of Chlorothiazide taken by the formula:

$$200C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorothiazide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of chlorothiazide obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorothiazide Oral Suspension

» Chlorothiazide Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of chlorothiazide ( $C_7H_6ClN_3O_4S_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Chlorothiazide RS

**Identification**—The UV absorption spectrum of the solution of chlorothiazide prepared from Oral Suspension as directed in the *Assay* exhibits maxima and minima at the same wavelengths as that of a solution of USP Chlorothiazide RS, prepared as directed in the *Assay*, concomitantly measured.

**Uniformity of dosage units** (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 3.2 and 4.0.

**Assay**—Transfer to a 250-mL volumetric flask an accurately measured volume of Oral Suspension, equivalent to about 250 mg of chlorothiazide, dilute with sodium hydroxide solution (1 in 250) to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add dilute hydrochloric acid (1 in 100) to volume, and mix. Transfer 50.0 mL of the resulting solution to a 125-mL separator, and wash with two 25-mL portions of chloroform, discarding the washings. Transfer 10.0 mL of the washed solution to a 100-mL volumetric flask, dilute with sodium hydroxide solution (1 in 250) to volume, and mix. Dissolve an accurately weighed quantity of USP Chlorothiazide RS in sodium hydroxide solution (1 in 250) to obtain a Standard solution having a known concentration of about 10 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using sodium hydroxide solution (1 in 250) as the blank. Calculate the quantity, in mg, of chlorothiazide ( $C_7H_6ClN_3O_4S_2$ ) in each mL of the Oral Suspension taken by the formula:

$$25(C/V)(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Chlorothiazide RS in the Standard solution; V is the volume, in mL, of Oral Suspension taken; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Oral Suspension and the Standard solution, respectively.

## Chlorothiazide Tablets

» Chlorothiazide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_7H_6ClN_3O_4S_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Chlorothiazide RS

**Identification**—

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a peak for chlorothiazide, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**B:** Powder 1 Tablet, and fuse it with a pellet of sodium hydroxide: the ammonia fumes produced turn moistened red litmus paper blue, and the residue responds to the test for Sulfite (191).

**Dissolution** (711)—

**Medium:** 0.05 M pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of  $C_7H_6ClN_3O_4S_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 294 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Chlorothiazide RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_7H_6ClN_3O_4S_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed solution of 0.08 M monobasic sodium phosphate (adjusted with phosphoric acid to a pH of  $2.9 \pm 0.1$ ) and methanol (95:5), making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Transfer an accurately weighed quantity of about 25 mg of USP Chlorothiazide RS to a 50-mL volumetric flask, add 5 mL of 0.05 M monobasic sodium phosphate solution, followed by 10 mL of acetonitrile to the flask, and sonicate with occasional shaking for about 3 minutes. Dilute with water to volume, mix, and filter to obtain a *Standard preparation* having a known concentration of about 0.5 mg of USP Chlorothiazide RS per mL.

**Assay preparation**—[NOTE—Prepare fresh daily.] Weigh and finely powder not less than 20 Tablets. Weigh accurately a portion of the powder, equivalent to about 250 mg of chlorothiazide, and transfer to a 500-mL volumetric flask. Add 50 mL of 0.05 M monobasic sodium phosphate solution, and shake by mechanical means for about 15 minutes followed by sonication for about 2 minutes. Add 100 mL of acetonitrile, sonicate for about 3 minutes, dilute with water to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1 and is fitted with a guard column. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the capacity factor ( $k'$ ) is not less than 4.3; the tailing factor (T) for chlorothiazide is not more than 2.0; the theoretical plate count (N) for chlorothiazide is not less than 1300; and

the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 15  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_7H_6ClN_3O_4S_2$  in the portion of Tablets taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorothiazide RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Chlorothiazide Sodium for Injection

$C_7H_5ClN_3NaO_4S_2$  317.71

2H-1,2,4-Benzothiadiazine-7-sulfonamide, 6-chloro-, 1,1-dioxide, monosodium salt.

6-Chloro-2H-1,2,4-benzothiadiazine-7-sulfonamide 1,1-dioxide monosodium salt [7085-44-1].

» Chlorothiazide Sodium for Injection is a sterile, freeze-dried mixture of Chlorothiazide Sodium (prepared by the neutralization of Chlorothiazide with the aid of Sodium Hydroxide) and Mannitol. It contains chlorothiazide sodium ( $C_7H_5ClN_3NaO_4S_2$ ) equivalent to not less than 93.0 percent and not more than 107.0 percent of the labeled amount of chlorothiazide ( $C_7H_6ClN_3O_4S_2$ ).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**USP Reference standards** (11)—

USP Chlorothiazide RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

**Identification, Ultraviolet Absorption** (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* sodium hydroxide solution (1 in 250).

**Bacterial endotoxins** (85)—It contains not more than 0.3 USP Endotoxin Unit per mg of chlorothiazide sodium.

**Uniformity of dosage units** (905): meets the requirements.

**pH** (791): between 9.2 and 10.0, in a solution prepared as directed in the labeling.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately weighed portion of Chlorothiazide Sodium for Injection, equivalent to about 500 mg of chlorothiazide, to a 1000-mL volumetric flask, add sodium hydroxide solution (1 in 250) to volume, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with sodium hydroxide solution (1 in 250) to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Chlorothiazide RS in the same medium having a known concentration of about 10  $\mu$ g per mL in 1-cm cells at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using sodium hydroxide solution (1 in 250) as the blank. Calculate the quantity, in mg, of

$C_7H_6ClN_3O_4S_2$  in the portion of Chlorothiazide Sodium for Injection taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Chlorothiazide RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the assay solution and the Standard solution, respectively.

### Chloroxylenol

$C_8H_9ClO$  156.61

Phenol, 4-chloro-3,5-dimethyl-

4-Chloro-3,5-xyleneol [88-04-0].

» Chloroxylenol contains not less than 98.5 percent of  $C_8H_9ClO$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Chloroxylenol RS

USP Chloroxylenol Related Compound A RS  
2-chloro-3,5-dimethylphenol.

**Identification, Infrared Absorption** (197K).

**Melting range** (741): between 114° and 116°.

**Water, Method I** (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Iron** (241)—Transfer 0.10 g to a suitable crucible, add 5 drops of sulfuric acid, and ignite at a low heat until thoroughly ashed. Add to the carbonized mass 10 drops of sulfuric acid, and heat cautiously until white fumes are no longer evolved. Ignite, preferably in a muffle furnace, at 500° to 600°, until the carbon is completely burned off. Cool, add 4 mL of 6 N hydrochloric acid, cover, digest on a steam bath for 15 minutes, uncover, and slowly evaporate on a steam bath to dryness. Moisten the residue with 1 drop of hydrochloric acid, add 10 mL of hot water, and digest for 2 minutes. Dilute with water to about 25 mL. Filter, if necessary, rinse the crucible and the filter with 10 mL of water, combining the filtrate and rinsing in a 50-mL color-comparison tube, add 2 mL of hydrochloric acid, dilute with water to 47 mL, and mix. The limit is 0.01%.

**Related compounds**—

**Standard solution**—Quantitatively dissolve accurately weighed quantities of 3,5-dimethylphenol and USP Chloroxylenol Related Compound A RS in chloroform to obtain a solution containing about 0.08 mg of each per mL.

**Test solution**—Quantitatively dissolve an accurately weighed quantity of Chloroxylenol in chloroform to obtain a solution containing about 40.0 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.8-m column packed with 3% phase G16 on support S1A. The carrier gas is dry nitrogen, flowing at a rate of about 30 mL per minute. The column temperature is maintained at 180°, and the injection port and detector block temperatures are maintained at 200°. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between 3,5-dimethylphenol and chloroxylenol related compound A is not less than 4.5; and the relative standard deviation for replicate injections is not more than 10%.

**Procedure**—Separately inject equal volumes (about 1  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentages of 3,5-dimethylphenol ( $C_8H_{10}O$ ) and chloroxylenol related compound A ( $C_8H_9ClO$ ) in the portion of Chloroxylenol taken by the formula:

$$0.2(r_U / r_S)$$

in which  $r_U$  and  $r_S$  are the peak areas of the appropriate analyte obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% of 3,5-dimethylphenol or chloroxylenol related compound A is found. Calculate the percentage of each impurity in the portion of Chloroxylenol taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the area of each peak obtained from the *Test solution*, excluding that of the main chloroxylenol peak, the 3,5-dimethylphenol peak, and the chloroxylenol related compound A peak; and  $r_S$  is the sum of the areas of all the peaks: not more than 0.5% of any individual impurity is found. Calculate the percentage of total impurities in the portion of Chloroxylenol taken by the formula:

$$100(r_T / r_S)$$

in which  $r_T$  is the sum of the areas of all the peaks obtained from the *Test solution*, excluding that of the main chloroxylenol peak; and  $r_S$  is the sum of the areas of all the peaks obtained from the *Test solution*: not more than 1.5% of total impurities is found.

#### Assay—

**Internal standard solution**—Prepare a solution of *p*-chlorophenol in chloroform containing about 0.8 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chloroxylenol RS in *Internal standard solution* to obtain a solution having a known concentration of about 1 mg per mL.

**Assay preparation**—Transfer about 100 mg of Chloroxylenol, accurately weighed, to a 100-mL volumetric flask, dissolve in *Internal standard solution*, dilute with *Internal standard solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.8-m column packed with 3% phase G16 on support S1A. The injection port, column, and detector block are maintained at 210°. Dry nitrogen, flowing at a rate of about 30 mL per minute, is used as the carrier gas. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the *p*-chlorophenol peak and the chloroxylenol peak is not less than 2.0; the tailing factor for the chloroxylenol peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 2  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the gas chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the quantity, in mg, of chloroxylenol ( $C_8H_9ClO$ ) in the portion of Chloroxylenol taken by the formula:

$$100C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chloroxylenol RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the response of the chloroxylenol peak to that of the *p*-chlorophenol peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorpheniramine Maleate

$C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  390.86

2-Pyridinepropanamine,  $\gamma$ -(4-chlorophenyl)-*N,N*-dimethyl-, (*Z*)-2-butenedioate (1:1).

2-[*p*-Chloro- $\alpha$ -[2-(dimethylamino)ethyl]benzyl]pyridine maleate (1:1) [113-92-8].

» Chlorpheniramine Maleate contains not less than 98.0 percent and not more than 100.5 percent of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards <11>—

USP Chlorpheniramine Maleate RS

**Identification**, *Infrared Absorption* <197K>.

**Melting range** <741>: between 130° and 135°.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.2%.

#### Related compounds—

**Test preparation**—Dissolve about 200 mg of Chlorpheniramine Maleate in 5 mL of methylene chloride, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 1.2-m  $\times$  4-mm glass column containing 3% phase G3 on support S1AB. The column temperature is maintained at about 190°, and the injection port and detector temperatures are both maintained at about 250°. The carrier gas is dry helium, flowing at a rate adjusted to obtain a retention time of 4 to 5 minutes for the main peak. Chromatograph the *Test preparation*, record the chromatogram, and determine the peak area as directed for *Procedure*: the tailing factor for the chlorpheniramine maleate peak is not more than 1.8.

**Procedure**—Inject a volume (about 1  $\mu$ L) of the *Test preparation* into the chromatograph. Record the chromatogram for a total time of not less than twice the retention time of the chlorpheniramine peak, and measure the areas of the peaks. The total relative area of all extraneous peaks (except that of the solvent peak and maleic acid, if observed) does not exceed 2.0%.

**Assay**—Dissolve about 500 mg of Chlorpheniramine Maleate, accurately weighed, in 20 mL of glacial acetic acid. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 19.54 mg of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ .

## Chlorpheniramine Maleate Extended-Release Capsules

» Chlorpheniramine Maleate Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled

amount of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label the Capsules to indicate the *Dissolution Test* with which the product complies.

**USP Reference standards** (11)—

USP Chlorpheniramine Maleate RS

**Identification**—

**A:** The retention time of the chlorpheniramine peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer the contents of 1 Capsule to a 10-mL volumetric flask, add 5 mL of methanol, and insert the stopper into the flask. Sonicate this solution for 10 minutes, dilute with water to volume, mix, and filter. Apply separately 10  $\mu$ L of this solution and 10  $\mu$ L of a solution of USP Chlorpheniramine Maleate RS in a mixture of methanol and water (1:1) containing about 1.2 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (100:5:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, allow the solvent to evaporate, and examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot observed in the chromatogram of the solution under test corresponds to that obtained from the Standard solution.

**Dissolution** (711)—

TEST 1—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

*Medium:* water; 500 mL.

*Apparatus 1:* 100 rpm.

*Times:* 1.5, 6.0, and 10.0 hours.

*Procedure*—Determine the amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  dissolved by employing the method set forth in the *Assay*, using a filtered portion of the solution under test in comparison with a Standard solution having a known concentration of USP Chlorpheniramine Maleate RS in the same medium.

*Tolerances*—The percentages of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1.5	between 15% and 40%
6.0	between 50% and 80%
10.0	not less than 70%

TEST 2—If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*. Proceed as directed for *Procedure for Method B* under *Apparatus 1* and *Apparatus 2*, *Delayed-Release Dosage Forms*.

*Medium*—Prepare as directed under *Method B*, except use 900 mL of media. Operate the apparatus for 1 hour in the *Acid Stage* and use the acceptance criteria given under *Tolerances*. Operate the apparatus for 6 hours in the *Buffer Stage*, except to use 900 mL of simulated intestinal fluid TS without enzyme, and use the acceptance criteria given under *Tolerances*.

*Apparatus 2:* 50 rpm.

*Times:* 1.0 hour, 3.0 hours, 7.0 hours.

*Procedure*—Proceed as directed in *Test 1*.

*Tolerances*—The percentages of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
1.0	between 30% and 60%
3.0	between 55% and 85%
7.0	not less than 70%

**Uniformity of dosage units** (905)—meet the requirements.

**Assay**—

*Mobile phase*—Dissolve 2.0 g of sodium perchlorate in 350 mL of water. Add 650 mL of methanol and 2.0 mL of triethylamine, and mix. Filter, and degas this solution prior to use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in dilute hydrochloric acid (1 in 100) to obtain a solution having a known concentration of about 0.12 mg per mL.

*Assay preparation*—Weigh and mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the mixture, equivalent to about 120 mg of chlorpheniramine maleate, to a 200-mL volumetric flask. Add about 100 mL of dilute hydrochloric acid (1 in 100), bring to a boil on a hot plate, and continue boiling moderately for 5 minutes. Cool, dilute with dilute hydrochloric acid (1 in 100) to volume, mix, and filter. Transfer 10.0 mL of the filtrate to a 50-mL volumetric flask, dilute with dilute hydrochloric acid (1 in 100) to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 261-nm detector and a 3.9-mm  $\times$  15-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 900 theoretical plates, the tailing factor is not greater than 2.0, and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Capsules taken by the formula:

$$(1000C)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorpheniramine Maleate Injection

» Chlorpheniramine Maleate Injection is a sterile solution of Chlorpheniramine Maleate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Chlorpheniramine Maleate RS

USP Endotoxin RS

**Identification**—

**A:** Dilute a volume of Injection, equivalent to about 50 mg of chlorpheniramine maleate, with dilute hydrochlo-

ric acid (1 in 1000) to 25 mL, and proceed as directed under *Identification—Organic Nitrogenous Bases* (181), beginning with "Transfer the liquid to a separator." The Injection meets the requirements of the test.

**B:** Evaporate a volume of Injection, equivalent to about 25 mg of chlorpheniramine maleate, on a steam bath to dryness, and dry the residue at 105° for 1 hour: it melts between 128° and 135°.

**Bacterial endotoxins** (85)—It contains not more than 8.8 USP Endotoxin Units per mg of chlorpheniramine maleate.

**pH** (791): between 4.0 and 5.2.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Proceed with Injection as directed under *Salts of Organic Nitrogenous Bases* (501), to prepare the solution employed for the determination of the absorbance,  $A_U$ , at 264 nm. For the determination of  $A_S$ , dissolve about 25 mg of USP Chlorpheniramine Maleate RS, accurately weighed, in 20 mL of dilute sulfuric acid (1 in 350), and treat this solution the same as the portion of Injection being assayed. Calculate the quantity, in mg, of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  in each mL of the Injection taken by the formula:

$$(C / V)(A_U / A_S)$$

in which C is the weight, in mg, of USP Chlorpheniramine Maleate RS in the *Standard preparation*, and V is the volume, in mL, of Injection taken.

## Chlorpheniramine Maleate Oral Solution

» Chlorpheniramine Maleate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Chlorpheniramine Maleate RS

**Identification**—

**A:** Evaporate the remaining extract from the Assay on a steam bath to a small volume, then transfer it to a smaller, more suitable vessel, and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3-mL portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute with dimethylformamide to 15.0 mL, and mix: the optical rotation of the solution so obtained, in a 100-mm tube, after correcting for the blank, is not more than +0.01° (*dissolution from dexchlorpheniramine maleate*).

**B:** *Ultraviolet Absorption* (197U)—

**Solution:** the solution employed for measurement of absorbance in the Assay.

**Alcohol content** (*if present*) (611): between 6.0% and 8.0% of  $C_2H_5OH$ .

**Assay**—Transfer 10 mL of Oral Solution, accurately measured, to a separator. Transfer about 40 mg of USP Chlorpheniramine Maleate RS, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, mix, and pipet 10 mL of this Standard solution into a separator similar to that containing the Oral Solution. Treat each solution as follows. Add 10 mL of sodium hydroxide solution (1 in 10), and extract with two 50-mL portions of solvent hexane. Combine the extracts in a second separator, wash with 10 mL of sodium hydroxide solution (1 in 250), and discard the washing. Extract the hexane solution with two 40-mL

portions of dilute hydrochloric acid (1 in 100), collect the extracts in a 100-mL volumetric flask, add the same dilute acid to volume, and mix. Wash 50-mL portions of each solution, and of dilute hydrochloric acid (1 in 100), respectively, with three 30-mL portions of chloroform and then with 50 mL of solvent hexane, and discard the washings. Filter the acid phases through paper, discarding the first few mL of each filtrate, and determine the absorbances of the solutions obtained from the Oral Solution and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 264 nm, with a suitable spectrophotometer, using the extracted acid as the blank. Calculate the quantity, in  $\mu g$ , of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each mL of the Oral Solution taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in  $\mu g$  per mL, of USP Chlorpheniramine Maleate RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the Oral Solution and the Standard solution, respectively.

## Chlorpheniramine Maleate Tablets

» Chlorpheniramine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Chlorpheniramine Maleate RS

**Identification**—Disperse a portion of powdered Tablets, equivalent to about 25 mg of chlorpheniramine maleate, in about 20 mL of dilute hydrochloric acid (1 in 100). Dissolve about 25 mg of USP Chlorpheniramine Maleate RS in 20 mL of dilute hydrochloric acid (1 in 100). Treat each solution as follows. Render alkaline, to a pH of about 11, with sodium hydroxide solution (1 in 10). Extract with two 50-mL portions of solvent hexane, collect the extracts in a beaker, and evaporate to dryness. Prepare a mineral oil dispersion of the residue so obtained and determine the IR absorption spectrum of the preparation in the region between 2  $\mu m$  and 12  $\mu m$ : the spectrum of the test preparation exhibits maxima only at the same wavelengths as that of the Standard preparation.

**Dissolution** (711)—

**Medium:** 0.01 N hydrochloric acid; 500 mL

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 265 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Chlorpheniramine Maleate RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Using a portion of powdered Tablets equivalent to 4 mg of chlorpheniramine maleate, proceed as directed under *Salts of Organic Nitrogenous Bases* (501), but using dilute hydrochloric acid (1 in 100) instead of the dilute sulfuric acid (1 in 350), and dilute sulfuric acid (1 in 70), and using solvent hexane instead of the ether, and diluting

10 mL of the *Assay preparation* with dilute hydrochloric acid (1 in 100) to 25.0 mL to prepare the solution employed for the determination of the absorbance,  $A_U$ , at 264 nm. For the determination of  $A_S$ , prepare a solution containing about 40 mg of USP Chlorpheniramine Maleate RS, accurately weighed, in 200.0 mL of dilute hydrochloric acid (1 in 100), and treat 20.0 mL of this solution the same as the solution in dilute hydrochloric acid (1 in 100) of the portion of Tablets taken. Calculate the quantity, in mg, of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  in the portion of Tablets taken by the formula:

$$C(A_U / A_S)$$

in which C is the weight, in mg, of USP Chlorpheniramine Maleate RS in the 20.0-mL portion of the *Standard preparation*.

### Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules

» Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) and phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

#### USP Reference standards (11)—

USP Chlorpheniramine Maleate RS

USP Phenylpropanolamine Hydrochloride RS

#### Identification—

**A:** The retention time of the major peak for chlorpheniramine maleate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**B:** The retention time of the major peak for phenylpropanolamine hydrochloride in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for phenylpropanolamine hydrochloride*.

#### Dissolution (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Times:* 3, 6, and 12 hours.

*Procedure*—Determine the amounts of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  and  $C_9H_{13}NO \cdot HCl$  dissolved by employing the methods set forth in the *Assay for chlorpheniramine maleate* and the *Assay for phenylpropanolamine hydrochloride*.

*Tolerances*—The percentages of the labeled amounts of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  and  $C_9H_{13}NO \cdot HCl$  dissolved at the specified times conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
3	between 20% and 50%
6	between 45% and 75%
12	not less than 75%

**Uniformity of dosage units (905):** meet the requirements.

#### Assay for chlorpheniramine maleate—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.05 g of triethylamine hydrochloride, 0.025 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with phosphoric acid solution (1 in 1000) to obtain a solution having a known concentration of about 8 µg per mL.

*Assay preparation*—Transfer not fewer than 10 Capsules to a suitable container, add 100 mL of water and 10 mL of phosphoric acid solution (1 in 20), and heat gently until the Capsules are fully dispersed. Cool to room temperature, and transfer an accurately measured volume of the solution, equivalent to about 0.8 mg of chlorpheniramine maleate, to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter.

*System suitability solution*—Mix 1 part of the *Standard preparation* prepared above with 1 part of the *Standard preparation* prepared as directed in the *Assay for phenylpropanolamine hydrochloride*.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Separately inject about 20 µL of the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between phenylpropanolamine and chlorpheniramine is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the phenylpropanolamine peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for phenylpropanolamine hydrochloride—

*Mobile phase* and *Chromatographic system*—Proceed as directed in the *Assay for chlorpheniramine maleate*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Phenylpropanolamine Hydrochloride RS in water to obtain a solution having a known concentration of about 2.5 mg per mL. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, add 5 mL of methanol, dilute with phosphoric acid solution (1 in 1000) to volume, and mix.

*System suitability solution*—Mix 1 part of the *Standard preparation* prepared above with 1 part of the *Standard preparation* prepared as directed in the *Assay for chlorpheniramine maleate*.

*Assay preparation*—Transfer not fewer than 10 Capsules to a suitable container, add 100 mL of water and 10 mL of phosphoric acid solution (1 in 20), and heat gently until the Capsules are fully dispersed. Cool to room temperature, and transfer an accurately measured volume of the solution,

equivalent to about 5 mg of phenylpropanolamine hydrochloride, to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the phenylpropanolamine peaks. Calculate the quantity, in mg, of phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Phenylpropanolamine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the phenylpropanolamine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

### Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Tablets

» Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) and phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Chlorpheniramine Maleate RS  
USP Phenylpropanolamine Hydrochloride RS

**Identification**—

**A:** The retention time of the major peak for chlorpheniramine maleate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for chlorpheniramine maleate*.

**B:** The retention time of the major peak for phenylpropanolamine hydrochloride in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay for phenylpropanolamine hydrochloride*.

**Dissolution** <711>—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Times:* 3, 6, and 12 hours.

**Procedure**—Determine the amounts of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  and  $C_9H_{13}NO \cdot HCl$  dissolved by employing the methods set forth in the *Assay for chlorpheniramine maleate* and the *Assay for phenylpropanolamine hydrochloride*.

**Tolerances**—The percentages of the labeled amounts of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  and  $C_9H_{13}NO \cdot HCl$  dissolved at the specified times conform to *Acceptance Table 2*.

Time (hours)	Amount dissolved
3	between 20% and 50%
6	between 45% and 75%
12	not less than 75%

**Uniformity of dosage units** <905>: meet the requirements.

**Assay for chlorpheniramine maleate**—

*Mobile phase, Standard preparation, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay for chlorpheniramine maleate* under *Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of chlorpheniramine maleate, to a suitable container, add 100 mL of water and 10 mL of phosphoric acid solution (1 in 20), and heat gently until the powder is fully dispersed. Cool to room temperature, and transfer an accurately measured volume of this solution, equivalent to about 0.8 mg of chlorpheniramine maleate, to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter. Quantitatively dilute a portion of this solution, if necessary, with phosphoric acid solution (1 in 1000) to obtain a solution having a concentration of about 8 µg of chlorpheniramine maleate per mL.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Chlorpheniramine Maleate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for phenylpropanolamine hydrochloride**—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay for chlorpheniramine maleate* under *Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Phenylpropanolamine Hydrochloride RS in water to obtain a solution having a known concentration of about 2.5 mg per mL. Transfer 1.0 mL of this solution to a 50-mL volumetric flask, add 5 mL of methanol, dilute with phosphoric acid solution (1 in 1000) to volume, and mix.

**System suitability solution**—Proceed as directed in the *Assay for phenylpropanolamine hydrochloride* under *Chlorpheniramine Maleate and Phenylpropanolamine Hydrochloride Extended-Release Capsules*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 500 mg of phenylpropanolamine hydrochloride, to a suitable container, add 100 mL of water and 10 mL of phosphoric acid solution (1 in 20), and heat gently until the powder is fully dispersed. Cool to room temperature, and transfer an accurately measured volume of the solution, equivalent to about 5 mg of phenylpropanolamine hydrochloride, to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the phenylpropanolamine peaks. Calculate the quantity, in mg, of phenylpropanolamine hydrochloride ( $C_9H_{13}NO \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Phenylpropanolamine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the phenylpropanolamine peak

responses obtained from the Assay preparation and the Standard preparation, respectively.

**Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Extended-Release Capsules**

» Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of chlorpheniramine maleate (C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) and pseudoephedrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO · HCl).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**Labeling**—The labeling indicates the Dissolution Test with which the product complies.

**USP Reference standards** (11)—  
USP Chlorpheniramine Maleate RS  
USP Pseudoephedrine Hydrochloride RS

**Identification**—

**A:** The retention time of the major peak for chlorpheniramine maleate in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay for chlorpheniramine maleate.

**B:** The retention time of the major peak for pseudoephedrine hydrochloride in the chromatogram of the Assay preparation corresponds to that in the chromatogram of the Standard preparation, as obtained in the Assay for pseudoephedrine hydrochloride.

**Dissolution** (711)—

**TEST 1**—If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 1.

Medium: water; 900 mL.

Apparatus 2: 50 rpm.

Times: 3, 6, and 12 hours.

**Procedure**—Determine the amounts of chlorpheniramine maleate (C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) and pseudoephedrine hydrochloride (C<sub>10</sub>H<sub>15</sub>NO · HCl) dissolved by employing the methods set forth in the Assay for chlorpheniramine maleate and the Assay for pseudoephedrine hydrochloride, respectively.

**Tolerances**—The percentages of the labeled amounts of C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> and C<sub>10</sub>H<sub>15</sub>NO · HCl dissolved at the specified times conform to Acceptance Table 2.

Time (hours)	Amount dissolved
3	between 20% and 50%
6	between 45% and 75%
12	not less than 75%

**TEST 2**—If the product complies with this test, the labeling indicates that it meets USP Dissolution Test 2.

Medium 1: simulated gastric fluid TS, prepared without pepsin; 900 mL.

Medium 2: simulated intestinal fluid TS, prepared without pancreatin; 900 mL.

Apparatus 2: 50 rpm.

Time for Medium 1: 1.5 hours.

Times for Medium 2: 3 and 6 hours.

**Procedure**—Determine the amounts of chlorpheniramine maleate (C<sub>16</sub>N<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) and pseudoephedrine hydro-

chloride (C<sub>10</sub>H<sub>15</sub>NO · HCl) dissolved by employing the methods set forth in the Assay for chlorpheniramine maleate and the Assay for pseudoephedrine hydrochloride, respectively, using Standard solutions having known concentrations of the relevant USP Reference Standard in the appropriate Medium.

**Tolerances**—The percentages of the labeled amounts of C<sub>16</sub>N<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub> and C<sub>10</sub>H<sub>15</sub>NO · HCl dissolved at the specified times conform to Acceptance Table 2.

Time (hours)	Amount dissolved (Medium 1)	Amount dissolved (Medium 2)
1.5	between 15% and 40%	
3.0		between 35% and 75%
6.0		not less than 50%

**Uniformity of dosage units** (905): meet the requirements.

**Assay for chlorpheniramine maleate**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (60:40) containing 0.34 g of monobasic potassium phosphate, 0.15 g of triethylamine hydrochloride, 0.25 g of sodium lauryl sulfate, and 0.1 mL of phosphoric acid in each 100 mL of solution. Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 0.8 mg per mL. Quantitatively dilute a portion of this solution with a phosphoric acid solution (1 in 1000) to obtain a solution having a known concentration of about 8 µg per mL.

**Assay preparation**—Transfer not fewer than 10 Capsules to a suitable container. Add 100 mL of water and 10 mL of a phosphoric acid solution (1 in 20), and heat gently until the Capsules are fully dispersed. Cool to room temperature, and transfer an accurately measured volume of the solution, equivalent to about 0.8 mg of chlorpheniramine maleate, to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter.

**System suitability solution**—Mix 1 part of the Standard preparation prepared above with 1 part of the Standard preparation, prepared as directed in the Assay for pseudoephedrine hydrochloride.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 2 mL per minute. Inject about 20 µL of the System suitability solution, and record the peak responses as directed for Procedure: the resolution, R<sub>s</sub>, between pseudoephedrine and chlorpheniramine is not less than 2.0. Chromatograph the Standard preparation, and record the peak responses as directed for Procedure: the tailing factor for the chlorpheniramine peak is not greater than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate (C<sub>16</sub>H<sub>19</sub>ClN<sub>2</sub> · C<sub>4</sub>H<sub>4</sub>O<sub>4</sub>) in the portion of Capsules taken by the formula:

$$100C(r_u / r_s)$$

in which C is the concentration, in µg per mL, of USP Chlorpheniramine Maleate RS in the Standard preparation; and r<sub>u</sub> and r<sub>s</sub> are the chlorpheniramine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

**Assay for pseudoephedrine hydrochloride—**

*Mobile phase and Chromatographic system*—Proceed as directed in the Assay for chlorpheniramine maleate.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 3.0 mg per mL. Transfer about 1.0 mL of this solution to a 25-mL volumetric flask, dilute with 0.1% phosphoric acid to volume, and mix.

*System suitability solution*—Mix 1 part of the Standard preparation prepared above with 1 part of the Standard preparation prepared as directed in the Assay for chlorpheniramine maleate.

*Assay preparation*—Transfer not fewer than 10 Capsules to a suitable container. Add 100 mL of water and 10 mL of a phosphoric acid solution (1 in 20), and heat gently until the Capsules are fully dispersed. Cool to room temperature, and transfer an accurately measured volume of the solution, equivalent to about 12 mg of pseudoephedrine hydrochloride, to a 100-mL volumetric flask. Dilute with water to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the Standard preparation; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Oral Solution

» Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) and pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Chlorpheniramine Maleate RS

USP Pseudoephedrine Hydrochloride RS

**Identification**—

**A:** The retention time of the major peak for chlorpheniramine maleate in the chromatogram of the Assay preparation corresponds to that of the Standard preparation, as obtained in the Assay for chlorpheniramine maleate.

**B:** The retention time of the major peak for pseudoephedrine hydrochloride in the chromatogram of the Assay preparation corresponds to that of the Standard preparation in the Assay for pseudoephedrine hydrochloride.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay for chlorpheniramine maleate—**

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay for chlorpheniramine maleate under Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Extended-Release Capsules.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorpheniramine Maleate RS in water to obtain a solution having a known concentration of about 1 mg per mL. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, add 80 mL of Mobile phase, dilute with water to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 1 mg of chlorpheniramine maleate, to a 100-mL volumetric flask. Add about 80 mL of Mobile phase, dilute with water to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the chlorpheniramine peaks. Calculate the quantity, in mg, of chlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Oral Solution taken by the formula:

$$(100C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Chlorpheniramine Maleate RS in that Standard preparation; V is the volume, in mL, of Oral Solution taken for the Assay preparation; and  $r_U$  and  $r_S$  are the chlorpheniramine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

**Assay for pseudoephedrine hydrochloride—**

*Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay for chlorpheniramine maleate under Chlorpheniramine Maleate and Pseudoephedrine Hydrochloride Extended-Release Capsules.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Pseudoephedrine Hydrochloride RS in water to obtain a solution having a known concentration of about 1.5 mg per mL. Transfer about 1.0 mL of this solution to a 10-mL volumetric flask, add 8 mL of Mobile phase, dilute with water to volume, and mix.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 15 mg of pseudoephedrine hydrochloride, to a 100-mL volumetric flask. Add 80 mL of Mobile phase, dilute with water to volume, mix, and filter.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the pseudoephedrine peaks. Calculate the quantity, in mg, of pseudoephedrine hydrochloride ( $C_{10}H_{15}NO \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$100(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Pseudoephedrine Hydrochloride RS in the Standard preparation; V is the volume, in mL, of Oral Solution taken for the Assay preparation; and  $r_U$  and  $r_S$  are the pseudoephedrine peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Chlorpromazine

$C_{17}H_{19}ClN_2S$  318.86

10*H*-Phenothiazine-10-propanamine, 2-chloro-*N,N*-dimethyl-

2-Chloro-10-[3-(dimethylamino)propyl]phenothiazine [50-53-3].

» Chlorpromazine contains not less than 98.0 percent and not more than 101.0 percent of  $C_{17}H_{19}ClN_2S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Chlorpromazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

### Identification—

**A:** The IR absorption spectrum of a 1 in 100 solution in carbon disulfide, in a 1.0-mm cell between 7  $\mu$ m and 15  $\mu$ m, exhibits maxima only at the same wavelengths as that of a solution prepared by dissolving 55 mg of USP Chlorpromazine Hydrochloride RS in 3 mL of 1 N sodium hydroxide and extracting the resulting solution with 5.0 mL of carbon disulfide.

**B:** The principal spot found in the test for *Other alkylated phenothiazines* corresponds in  $R_f$  to the spot from the *Standard solution*.

**Loss on drying** (731)—Dry it in vacuum at room temperature for 3 hours: it loses not more than 1.0% of its weight.

**Other alkylated phenothiazines**—Dissolve 45.0 mg in 10 mL of methanol. Dissolve a suitable quantity of USP Chlorpromazine Hydrochloride RS in methanol to obtain a concentration of 5 mg per mL (*Standard solution*), and dilute it quantitatively and stepwise with methanol to obtain a concentration of 25  $\mu$ g per mL (*Diluted standard solution*). Apply separately 10  $\mu$ L of each of the three solutions to the starting line of a thin-layer chromatographic plate coated with chromatographic silica gel mixture. Develop the chromatogram, using as the solvent system a freshly prepared mixture of equal volumes of ether and ethyl acetate saturated with ammonium hydroxide, until the solvent front has moved about 10 cm from the origin. Remove the plate from the chamber, and air-dry for 20 minutes. View under short-wavelength UV light: the area and intensity of any spot, other than the principal spot, from the solution of Chlorpromazine are not greater than those of the spot from the *Diluted standard solution* (0.5%).

**Assay**—Place about 750 mg of Chlorpromazine, accurately weighed, in a 250-mL conical flask, and dissolve in 25 mL of glacial acetic acid, warming gently on a steam bath to effect solution. Cool, add crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.89 mg of  $C_{17}H_{19}ClN_2S$ .

## Chlorpromazine Suppositories

» Chlorpromazine Suppositories contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{19}ClN_2S$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers, at controlled room temperature.

### USP Reference standards (11)—

USP Chlorpromazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

**Identification**—Suppositories respond to *Identification test B* under *Chlorpromazine*.

**Other alkylated phenothiazines**—Transfer a portion of Suppositories, equivalent to 45 mg of chlorpromazine, to a stoppered centrifuge tube, add 10 mL of methanol, shake vigorously to disperse the solid, warming gently if necessary, and centrifuge. Proceed as directed in the test for *Other alkylated phenothiazines* under *Chlorpromazine*, beginning with "Dissolve a suitable quantity of USP Chlorpromazine Hydrochloride RS." The area and intensity of any spot, other than the principal spot, from the solution from the Suppositories are not greater than those of the spot from the *Diluted standard solution* (0.5%).

**Assay**—Place not fewer than 10 Suppositories in a 250-mL beaker, reduce the mass to the consistency of a paste by crushing with a spatula, and mix. Weigh accurately a portion of the mass, equivalent to about 50 mg of chlorpromazine, place in a beaker, and dissolve in about 40 mL of ether. Transfer to a 250-mL separator with the aid of three 25-mL portions of ether, and extract with four 75-mL portions of 0.1 N hydrochloric acid, collecting the aqueous extracts in a 500-mL volumetric flask. Add 0.1 N hydrochloric acid to volume, and mix. Transfer 10.0 mL of this solution to a 200-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix. Dissolve an accurately weighed quantity of USP Chlorpromazine Hydrochloride RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a *Standard solution* having a known concentration of about 5.5  $\mu$ g of chlorpromazine hydrochloride per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 254 nm and at 277 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of chlorpromazine ( $C_{17}H_{19}ClN_2S$ ) in the portion of Suppositories taken by the formula:

$$10(0.897C)(A_{254} - A_{277})_U / (A_{254} - A_{277})_S$$

in which 0.897 is the ratio of the molecular weight of chlorpromazine to that of chlorpromazine hydrochloride; C is the concentration, in  $\mu$ g per mL, of USP Chlorpromazine Hydrochloride RS in the *Standard solution*; and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution from the Suppositories (U) and the *Standard solution* (S), respectively.

## Chlorpromazine Hydrochloride

$C_{17}H_{19}ClN_2S \cdot HCl$  355.33  
 10*H*-Phenothiazine-10-propanamine, 2-chloro-*N,N*-dimethyl-, monohydrochloride.  
 2-Chloro-10-[3-(dimethylamino)propyl]phenothiazine monohydrochloride [69-09-0].

» Chlorpromazine Hydrochloride contains not less than 98.0 percent and not more than 101.5 percent of  $C_{17}H_{19}ClN_2S \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Chlorpromazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

### Identification—

**A:** Infrared Absorption (197K).

**B:** The principal spot found in the test for *Other alkylated phenothiazines* corresponds in  $R_f$  to the spot from the *Standard solution*.

**C:** A solution (1 in 10) responds to the tests for *Chloride* (191).

**Melting range** (741): between 195° and 198°.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Other alkylated phenothiazines**—Dissolve 50 mg, previously dried, in methanol to make 10 mL, and mix. Proceed as directed in the test for *Other alkylated phenothiazines* under *Chlorpromazine*, beginning with "Dissolve a suitable quantity of USP Chlorpromazine Hydrochloride RS." The area and intensity of any spot, other than the principal spot, from the solution of Chlorpromazine Hydrochloride are not greater than those of the spot from the *Diluted standard solution* (0.5%).

**Assay**—Transfer to a beaker about 700 mg of Chlorpromazine Hydrochloride, accurately weighed, and dissolve in 75 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Each mL of 0.1 N perchloric acid is equivalent to 35.53 mg of  $C_{17}H_{19}ClN_2S \cdot HCl$ .

## Chlorpromazine Hydrochloride Oral Concentrate

» Chlorpromazine Hydrochloride Oral Concentrate contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{17}H_{19}ClN_2S \cdot HCl$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it must be diluted prior to administration.

### USP Reference standards (11)—

USP Chlorpromazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

### Identification—

**A:** It responds to *Identification test A* under *Chlorpromazine Hydrochloride Syrup*.

**B:** Dilute a portion of the Oral Concentrate with an equal volume of water: the resulting solution responds to the tests for *Chloride* (191).

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for the absence of *Escherichia coli*.

**pH** (791): between 2.3 and 4.1.

**Limit of chlorpromazine sulfoxide**—Proceed as directed in the test for *Chlorpromazine sulfoxide* under *Chlorpromazine Hydrochloride Syrup*.

**Assay**—Transfer an accurately measured volume of Oral Concentrate, previously diluted if necessary, equivalent to about 10 mg of chlorpromazine hydrochloride, to a 50-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix. Proceed as directed in the *Assay* under *Chlorpromazine Hydrochloride Injection*, beginning with "Pipet 10 mL of the solution." Calculate the quantity, in mg, of  $C_{17}H_{19}ClN_2S \cdot HCl$  in each mL of the Oral Concentrate taken by the formula:

$$1.25C(A_{254} - A_{277})_U / V(A_{254} - A_{277})_S$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Chlorpromazine Hydrochloride RS in the *Standard solution*;  $V$  is the volume, in mL, of Oral Concentrate taken; and the parenthetic expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution from the Oral Concentrate ( $U$ ) and the *Standard solution* ( $S$ ), respectively.

## Chlorpromazine Hydrochloride Injection

» Chlorpromazine Hydrochloride Injection is a sterile solution of Chlorpromazine Hydrochloride in Water for Injection. It contains, in each mL, not less than 23.75 mg and not more than 26.25 mg of  $C_{17}H_{19}ClN_2S \cdot HCl$ .

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers, preferably of Type I glass, protected from light.

### USP Reference standards (11)—

USP Chlorpromazine Hydrochloride RS

USP Endotoxin RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

### Identification—

**A:** Transfer a volume of Injection, equivalent to about 25 mg of chlorpromazine hydrochloride, to a 10-mL volumetric flask, dilute with methanol to volume, and mix (test solution). Dissolve a suitable quantity of USP Chlorpromazine Hydrochloride RS in dilute methanol (9 in 10) to obtain a *Standard solution* having a known concentration of 2.5 mg per mL. Apply separately 5- $\mu\text{L}$  portions of each of the two solutions to the starting line of a thin-layer chromatographic plate (see *Chromatography* (621)) coated with chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a freshly prepared mixture of equal volumes of ether and ethyl acetate saturated with ammonium hydroxide until the solvent front has moved about 10 cm from the origin. Remove the plate from the developing chamber, air-dry for 20 minutes, then view

under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**B:** It responds to the tests for *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 6.9 USP Endotoxin Units per mg of chlorpromazine hydrochloride.

**pH** (791): between 3.4 and 5.4.

**Limit of chlorpromazine sulfoxide**—[NOTE—Conduct this test without exposure to daylight, and with the minimum necessary exposure to artificial light.]

**Test preparation**—Pipet 4 mL of the test solution prepared with methanol as directed in *Identification* test A into a 10-mL volumetric flask, dilute with methanol to volume, and mix.

**Standard preparation**—Dissolve a suitable quantity of USP Chlorpromazine Hydrochloride RS in methanol to obtain a solution having a concentration of 50 µg per mL.

**Procedure**—Apply separate 10-µL portions of the *Standard preparation* and the *Test preparation* to the starting line of a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture. Dry the applied solutions with the aid of a stream of nitrogen. Develop the chromatogram, using as the solvent system a freshly prepared mixture of equal volumes of ether and ethyl acetate saturated with ammonium hydroxide, until the solvent front has moved about 13 cm from the origin. Remove the plate from the chamber, and air-dry for 30 minutes. Examine under short-wavelength UV light: the area and intensity of the only other spot in the test specimen chromatogram, other than the principal spot, are not greater than those of the spot from the *Standard preparation* (5.0%).

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 100 mg of chlorpromazine hydrochloride, to a 500-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix. Pipet 10 mL of the solution into a 250-mL separator, add about 20 mL of water, render alkaline with ammonium hydroxide, and extract with four 25-mL portions of ether. Extract the combined ether extracts with four 25-mL portions of 0.1 N hydrochloric acid, collecting the aqueous extracts in a 250-mL volumetric flask. Aerate to remove residual ether, add 0.1 N hydrochloric acid to volume, and mix. Dissolve a suitable quantity, accurately weighed, of USP Chlorpromazine Hydrochloride RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the same acid to obtain a Standard solution having a known concentration of about 8 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 254 nm and at 277 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{17}H_{19}ClN_2S \cdot HCl$  in each mL of the Injection taken by the formula:

$$12.5C(A_{254} - A_{277})_U / V(A_{254} - A_{277})_S$$

in which C is the concentration, in µg per mL, of USP Chlorpromazine Hydrochloride RS in the Standard solution, V is the volume, in mL, of Injection taken, and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution from the Injection (U) and the Standard solution (S), respectively.

## Chlorpromazine Hydrochloride Syrup

» Chlorpromazine Hydrochloride Syrup contains, in each 100 mL, not less than 190 mg and not more than 210 mg of  $C_{17}H_{19}ClN_2S \cdot HCl$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Chlorpromazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

**Identification**—

**A:** Transfer a volume of it, equivalent to about 20 mg of chlorpromazine hydrochloride, to a 125-mL separator. Add 10 mL of water, 2 mL of sodium hydroxide solution (1 in 2), and mix. Extract with three 30-mL portions of ether. Filter the combined ether extracts through anhydrous sodium sulfate. With the aid of a stream of nitrogen evaporate the ether to about 5 mL. Quantitatively transfer the solution to a 40-mL centrifuge tube. Evaporate with a stream of nitrogen and mild heat to dryness. Dissolve the residue in 100 mL of methanol to obtain the Test solution. Separately apply 15 µL of this Test solution and 15 µL of a Standard solution, containing 0.2 mg of USP Chlorpromazine Hydrochloride RS per mL of methanol, to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram in a chamber containing a freshly prepared mixture of ethyl acetate that has been saturated with ammonium hydroxide, ether, and methanol (75:25:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and spray with iodoplatinate reagent prepared by dissolving 100 mg of platinum chloride in 10 mL of 0.1 N hydrochloric acid, adding 25 mL of potassium iodide solution (1 in 25), 0.5 mL of formic acid, and diluting with water to 100 mL: the  $R_f$  value of the principal spot from the test solution corresponds to that obtained from the Standard solution.

**B:** Dilute a portion of the Syrup with an equal volume of water: the resulting solution responds to the tests for *Chloride* (191).

**Limit of chlorpromazine sulfoxide**—

**Chlorpromazine sulfoxide standard solution**—Transfer 5 mL of a solution in dilute hydrochloric acid (1 in 100) of USP Chlorpromazine Hydrochloride RS containing 10.6 mg per mL to a 50-mL volumetric flask. Add 2 mL of 30% hydrogen peroxide and heat at 60° for 10 minutes. Cool, dilute with 1 M sodium bisulfite to volume, and mix. Transfer 10.0 mL to a 60-mL separator, add 2 mL of sodium hydroxide solution (1 in 2), and mix. Extract with three 30-mL portions of ether. Filter the extracts through ether-wetted anhydrous sodium sulfate into a 250-mL conical flask. Cautiously evaporate the extracts to dryness. Dissolve the residue in 10.0 mL of methanol, and filter if necessary. Each mL of this solution contains 1 mg of chlorpromazine sulfoxide.

**Procedure**—Transfer an accurately measured volume of the Syrup, equivalent to about 20 mg of chlorpromazine hydrochloride, to a 125-mL separator. Add 10 mL of water and 2 mL of sodium hydroxide solution (1 in 2), and mix. Extract with three 30-mL portions of ether. Filter the combined ether extracts through anhydrous sodium sulfate. With the aid of a stream of nitrogen evaporate the ether to about 5 mL. Quantitatively transfer the solution to a 40-mL centrifuge tube. Evaporate with a stream of nitrogen and mild heat to dryness. Dissolve the residue in 1.0 mL of methanol to obtain the Test solution. Separately apply 15 µL of this Test solution and 15 µL of a *Chlorpromazine sulfoxide standard solution* to a thin-layer chromatographic plate (see

*Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram in a chamber containing a freshly prepared mixture of ethyl acetate that has been saturated with ammonium hydroxide, ether, and methanol (75:25:20) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and spray with iodoplatinate reagent prepared by dissolving 100 mg of platinum chloride in 10 mL of 0.1 N hydrochloric acid, adding 25 mL of potassium iodide solution (1 in 25) and 0.5 mL of formic acid, and diluting with water to 100 mL. The chromatogram from the Test solution may exhibit a secondary spot whose  $R_f$  value corresponds to, and whose size and intensity are not greater than, those of the spot from the *Chlorpromazine sulfoxide standard solution* (5.0%).

**Assay**—Transfer an accurately measured volume of Syrup, equivalent to about 10 mg of chlorpromazine hydrochloride, to a 50-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix. Proceed as directed in the Assay under *Chlorpromazine Hydrochloride Injection*, beginning with "Pipet 10 mL of the solution." Calculate the quantity, in mg, of  $C_{17}H_{19}ClN_2S \cdot HCl$  in each mL of the Syrup taken by the formula:

$$1.25C(A_{254} - A_{277})_U / V(A_{254} - A_{277})_S$$

in which C is the concentration, in  $\mu g$  per mL, of USP Chlorpromazine Hydrochloride RS in the Standard solution; V is the volume, in mL, of Syrup taken; and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution from the Syrup (U) and the Standard solution (S), respectively.

## Chlorpromazine Hydrochloride Tablets

» Chlorpromazine Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{17}H_{19}ClN_2S \cdot HCl$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

### USP Reference standards (11)—

USP Chlorpromazine Hydrochloride RS

[NOTE—Throughout the following procedures, protect test or assay specimens, the Reference Standard, and solutions containing them by conducting the procedures without delay, under subdued light, or using low-actinic glassware.]

### Identification—

**A:** Tablets respond to Identification test B under *Chlorpromazine Hydrochloride*.

**B:** Digest a quantity of powdered Tablets, equivalent to about 25 mg of chlorpromazine hydrochloride, with 25 mL of water, and filter: the solution so obtained responds to Identification test C under *Chlorpromazine Hydrochloride*.

### Dissolution (711)—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 1:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{17}H_{19}ClN_2S \cdot HCl$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 254 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a Standard solution having a known concentration of USP Chlorpromazine Hydrochloride RS in the same medium.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{17}H_{19}ClN_2S \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Other alkylated phenothiazines**—Transfer a portion of finely powdered Tablets, equivalent to 50 mg of chlorpromazine hydrochloride, to a stoppered centrifuge tube, add 10 mL of methanol, shake vigorously, and centrifuge (remove any sugar coating by prior washing with water). Proceed as directed in the test for *Other alkylated phenothiazines* under *Chlorpromazine*, beginning with "Dissolve a suitable quantity of USP Chlorpromazine Hydrochloride RS." The area and intensity of any spot, other than the principal spot, from the solution from the Tablets are not greater than those of the spot from the *Diluted standard solution* (0.5%).

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of chlorpromazine hydrochloride, to a 500-mL volumetric flask. Add about 200 mL of water and 5 mL of hydrochloric acid, insert the stopper, and shake for about 10 minutes. Dilute with water to volume, and mix. Filter a portion of the solution, discarding the first 50 mL of the filtrate. Treat 10.0 mL of the filtrate as directed in the Assay under *Chlorpromazine Hydrochloride Injection*, beginning with "Pipet 10 mL of the solution." Calculate the quantity, in mg, of  $C_{17}H_{19}ClN_2S \cdot HCl$  in the portion of Tablets taken by the formula:

$$12.5C(A_{254} - A_{277})_U / (A_{254} - A_{277})_S$$

in which C is the concentration, in  $\mu g$  per mL, of USP Chlorpromazine Hydrochloride RS in the Standard solution, and the parenthetical expressions are the differences in the absorbances of the two solutions at the wavelengths indicated by the subscripts, for the solution from the Tablets (U) and the Standard solution (S), respectively.

## Chlorpropamide

$C_{10}H_{13}ClN_2O_3S$  276.74

Benzenesulfonamide, 4-chloro-N-[(propylamino)carbonyl]-1-[(p-chlorophenyl)sulfonyl]-3-propylurea [94-20-2].

» Chlorpropamide contains not less than 97.0 percent and not more than 103.0 percent of  $C_{10}H_{13}ClN_2O_3S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Chlorpropamide RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** It responds to the *Thin-Layer Chromatographic Identification Test* (201). Prepare the test solution by dissolving an accurately weighed quantity of Chlorpropamide in acetone to obtain a solution containing 1 mg per mL. Develop the chromatogram in a solvent system consisting of a mixture of methylene chloride, methanol, cyclohexane, and ammonium hydroxide (100:50:30:10).

**Melting range** (741): between 126° and 129°.

**Loss on drying** (731)—Dry it in vacuum at 60° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.4%.

**Selenium** (291): 0.003%.

**Heavy metals, Method II** (231): 0.003%.

**Assay—**

*Mobile phase*—Prepare a filtered and degassed mixture of equal volumes of acetonitrile and dilute glacial acetic acid (1 in 100). [NOTE—Do not exceed 50% of acetonitrile.] Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorpropamide RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

*Assay preparation*—Transfer about 50 mg of Chlorpropamide, accurately weighed, to a 100-mL volumetric flask, add *Mobile phase* to volume, and mix. Transfer 10 mL of this solution to a second 100-mL volumetric flask, add *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 240-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factor for the analyte peak is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>10</sub>H<sub>13</sub>ClN<sub>2</sub>O<sub>3</sub>S in the portion of Chlorpropamide taken by the formula:

$$1000C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Chlorpropamide RS in the *Standard preparation*, and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorpropamide Tablets

» Chlorpropamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>10</sub>H<sub>13</sub>ClN<sub>2</sub>O<sub>3</sub>S.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Chlorpropamide RS

**Identification**—Shake a quantity of finely powdered Tablets, equivalent to about 100 mg of chlorpropamide, with 20 mL of 1 N hydrochloric acid, and extract with 50 mL of chloroform. Filter the chloroform through chloroform-washed cotton into a suitable beaker, and evaporate the chloroform on a steam bath with the aid of a current of dry air to dryness. Dry the residue at 105° for 1 hour: the residue so obtained responds to the *Identification* tests under *Chlorpropamide*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 60 minutes.

*Procedure*—Determine the amount of C<sub>10</sub>H<sub>13</sub>ClN<sub>2</sub>O<sub>3</sub>S dissolved from UV absorbances at the wavelength of maximum absorbance at about 230 nm of filtered portions of the solu-

tion under test, suitably diluted with 0.1 N hydrochloric acid in comparison with a Standard solution having a known concentration of USP Chlorpropamide RS in 0.1 N hydrochloric acid. [NOTE—A volume of alcohol not exceeding 10% of the final volume of the Standard solution may be used to dissolve the USP Chlorpropamide RS.]

*Tolerances*—Not less than 75% (Q) of the labeled amount of C<sub>10</sub>H<sub>13</sub>ClN<sub>2</sub>O<sub>3</sub>S is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Chlorpropamide*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of chlorpropamide, to a 100-mL volumetric flask. Add *Mobile phase* to volume, mix, and filter, discarding the first 10 mL of the filtrate. Pipet 10 mL of the filtrate into a second 100-mL volumetric flask, add *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Chlorpropamide*. Calculate the quantity, in mg, of C<sub>10</sub>H<sub>13</sub>ClN<sub>2</sub>O<sub>3</sub>S in the portion of Tablets taken by the formula:

$$1000C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Chlorpropamide RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlortetracycline Bisulfate

» Chlortetracycline Bisulfate has a potency equivalent to not less than 760 µg of chlortetracycline hydrochloride (C<sub>22</sub>H<sub>23</sub>ClN<sub>2</sub>O<sub>8</sub> · HCl) per mg, calculated on the dried and butyl alcohol-free basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

**USP Reference standards** (11)—  
USP Chlortetracycline Hydrochloride RS

**Identification, Ultraviolet Absorption** (197U)—

*Solution*: 40 µg per mL.

*Medium*: 0.1 N hydrochloric acid.

Absorptivity at 368 nm, calculated on the dried and butyl alcohol-free basis, is not less than 83.0% and not more than 95.0% of that of the USP Chlortetracycline Hydrochloride RS, the potency of the Reference Standard being taken into account.

**Crystallinity** (695): meets the requirements.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

**Sulfate content**—Transfer about 1 g, accurately weighed, to a 250-mL beaker, and dissolve in about 100 mL of water. Neutralize the solution with 7.5 N ammonium hydroxide to litmus paper, and warm. Filter, and wash the filter with warm water. Neutralize the filtrate with 6 N hydrochloric acid to litmus, and add an additional 4 mL of 6 N hydrochloric acid. Heat the solution to boiling, and add, with constant stirring, sufficient boiling barium chloride TS to precipitate all of the sulfate. Add an additional 2 mL of bar-

ium chloride TS, and digest on a steam bath for 1 hour. Filter the mixture through ashless filter paper, transferring the residue quantitatively to the filter, and wash the residue with hot water until no precipitate is obtained when 1 mL of silver nitrate TS is added to 5 mL of washing. Transfer the paper containing the residue to a tared crucible. Char the paper, without burning, and ignite the crucible and its contents to constant weight. Perform a blank determination concurrently with the test specimen determination, and subtract the weight of residue obtained from that obtained in the test specimen determination to obtain the weight of residue attributable to the sulfate content of the specimen: not less than 15.0% is found, calculated on the dried and butyl alcohol-free basis.

#### Butyl alcohol—

**Ceric ammonium nitrate solution**—Dissolve 20 g of ceric ammonium nitrate in 4 N nitric acid to obtain 100 mL of solution.

**Standard preparations**—Transfer about 3 g of butyl alcohol, accurately weighed, to a 1000-mL volumetric flask containing 800 mL of water, shake to dissolve, dilute with water to volume, and mix (*Standard preparation 1*). Transfer 10.0 mL of *Standard preparation 1* and 1 drop of dimethicone to a 50-mL distilling flask equipped with a condenser and an extension that reaches into a collecting tube maintained in an ice-water bath. Distill slowly, and collect about 8 mL of distillate. Warm the distillate to ambient temperature, and transfer with the aid of water to a 10-mL volumetric flask. Dilute with water to volume, and mix (*Standard preparation 2*).

**Test preparation**—Transfer an accurately weighed specimen, equivalent to about 30 mg of butyl alcohol, to a 50-mL distilling flask equipped with a condenser and an extension that reaches into a collecting tube maintained in an ice bath. Add 25 mL of water and 1 drop of dimethicone to the distilling flask. Distill slowly, and collect about 8 mL of the distillate. Warm the distillate to ambient temperature, and transfer with the aid of water to a 10-mL volumetric flask. Dilute with water to volume, and mix.

**Procedure**—To four separate test tubes add, respectively, 5.0 mL of *Standard preparation 1*, 5.0 mL of *Standard preparation 2*, 5.0 mL of *Test preparation*, and 5.0 mL of water to provide a blank. To each add 2.0 mL of *Ceric ammonium nitrate solution*, and mix. Concomitantly determine the absorbances of the solutions from the *Standard preparations* and the *Test preparation* at the wavelength of maximum absorbance at about 475 nm, with a suitable spectrophotometer, using the blank to set the instrument to zero. In a suitable determination, the absorbance of the solution from *Standard preparation 2* is not less than 98.0% of the absorbance of the solution from *Standard preparation 1*. Calculate the percentage of butyl alcohol in the specimen taken by the formula:

$$1000(W_S / W_U)(A_U / A_S)$$

in which  $W_S$  is the weight, in g, of butyl alcohol taken to prepare *Standard preparation 1*,  $W_U$  is the weight, in mg, of specimen taken, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and *Standard preparation 2*, respectively: not more than 15.0% is found.

**Assay**—Proceed with Chlortetracycline Bisulfate as directed for chlortetracycline under *Antibiotics—Microbial Assays* (81).

### Chlortetracycline and Sulfamethazine Bisulfates Soluble Powder

» Chlortetracycline and Sulfamethazine Bisulfates Soluble Powder is a dry mixture of Chlortetracy-

cline Bisulfate and Sulfamethazine Bisulfate and one or more suitable buffers and diluents. It contains the equivalent of not less than 85.0 percent and not more than 125.0 percent of the labeled amounts of chlortetracycline hydrochloride ( $C_{22}H_{24}N_2O_8 \cdot HCl$ ) and sulfamethazine ( $C_{12}H_{14}N_4O_2S$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

#### USP Reference standards (11)—

USP Chlortetracycline Hydrochloride RS

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

**Assay for chlortetracycline hydrochloride**—Proceed as directed for chlortetracycline under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Powder, equivalent to about 100 mg of chlortetracycline hydrochloride, dissolved in an accurately measured volume of 0.01 N hydrochloric acid to obtain a stock solution having a convenient concentration. Dilute an accurately measured volume of this stock solution quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for sulfamethazine**—Proceed as directed under *Nitrite Titration* (451), using an accurately weighed quantity of Powder, equivalent to about 500 mg of sulfamethazine. Each mL of 0.1 M sodium nitrite is equivalent to 27.83 mg of sulfamethazine ( $C_{12}H_{14}N_4O_2S$ ).

### Chlortetracycline Hydrochloride

$C_{22}H_{23}ClN_2O_8 \cdot HCl$  515.34

2-Naphthacenecarboxamide, 7-chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-, monohydrochloride [4S-(4 $\alpha$ ,4a $\alpha$ ,5a $\alpha$ ,6 $\beta$ ,12a $\alpha$ )]-

7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride [64-72-2].

» Chlortetracycline Hydrochloride has a potency of not less than 900  $\mu$ g of  $C_{22}H_{23}ClN_2O_8 \cdot HCl$  per mg.

**NOTE**—Chlortetracycline Hydrochloride labeled solely for use in preparing oral veterinary dosage forms has a potency of not less than 820  $\mu$ g of  $C_{22}H_{23}ClN_2O_8 \cdot HCl$  per mg.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Where it is intended for use in preparing sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of sterile dosage forms.

**USP Reference standards** (11)—

USP Chlortetracycline Hydrochloride RS

USP Oxytetracycline RS

USP Tetracycline Hydrochloride RS

**Identification**—

**A:** Proceed as directed for *Method II* under *Identification—Tetracyclines* (193), using a methanol solution containing 0.5 mg per mL as the *Test solution* and a methanol solution containing in each mL 0.5 mg of USP Chlortetracycline Hydrochloride RS, 0.5 mg of USP Oxytetracycline RS, and 0.5 mg of USP Tetracycline Hydrochloride RS as the *Resolution solution*.

**B:** A solution (1 in 20) meets the requirements of the tests for *Chloride* (191).

**Specific rotation** (781S): between  $-235^\circ$  and  $-250^\circ$ .

*Test solution:* 5 mg per mL, in water, that has been allowed to stand in the dark for 30 minutes.

**Crystallinity** (695): meets the requirements.

**Sterility** (71)—Where the label states that Chlortetracycline Hydrochloride is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, 6 g of specimen aseptically dissolved in 200 mL of *Fluid D* being used.

**pH** (791): between 2.3 and 3.3, in a solution containing 10 mg per mL.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at  $60^\circ$  for 3 hours: it loses not more than 2.0% of its weight.

**Assay**—Proceed with Chlortetracycline Hydrochloride as directed under *Antibiotics—Microbial Assays* (81).

---

**Chlortetracycline Hydrochloride Ointment**

---

» Chlortetracycline Hydrochloride Ointment contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of  $C_{22}H_{23}ClN_2O_8 \cdot HCl$  in a suitable ointment base.

**Packaging and storage**—Preserve in collapsible tubes or in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Chlortetracycline Hydrochloride RS

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Ointment, equivalent to about 30 mg of chlortetracycline hydrochloride, shaken in a separator with about 50 mL of ether, and extracted with four 20-mL portions of 0.01 N hydrochloric acid. Combine the aqueous extracts in a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Dilute this stock solution quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration assumed to be equal to the medium dose level of the Standard.

---

**Chlortetracycline Hydrochloride Ophthalmic Ointment**

---

» Chlortetracycline Hydrochloride Ophthalmic Ointment contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of  $C_{22}H_{23}ClN_2O_8 \cdot HCl$ .

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

**USP Reference standards** (11)—

USP Chlortetracycline Hydrochloride RS

**Sterility** (71): meets the requirements.

**Minimum fill** (755): meets the requirements.

**Water, Method I** (921): not more than 0.5%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

**Assay**—Proceed as directed under *Antibiotics—Microbial Assays* (81), using an accurately weighed quantity of Ophthalmic Ointment, equivalent to about 10 mg of chlortetracycline hydrochloride, shaken in a separator with about 50 mL of ether, and extracted with four 20-mL portions of 0.01 N hydrochloric acid. Combine the aqueous extracts in a 100-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Dilute this stock solution quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

---

**Chlortetracycline Hydrochloride Soluble Powder**

---

» Chlortetracycline Hydrochloride Soluble Powder contains not less than 90.0 percent and not more than 125.0 percent of the labeled amount of  $C_{22}H_{23}ClN_2O_8 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers, protected from light.

**Labeling**—Label it to indicate that it is intended for oral veterinary use only.

**USP Reference standards** (11)—

USP Chlortetracycline Hydrochloride RS

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at  $60^\circ$  for 3 hours: it loses not more than 2.0% of its weight.

**Assay**—

*Assay preparation 1* (where it is labeled on a weight basis)—Dissolve about 3 g of Powder in an accurately measured volume of 0.01 N hydrochloric acid sufficient to obtain a solution containing not less than 1000  $\mu$ g of chlortetracycline hydrochloride ( $C_{22}H_{23}ClN_2O_8 \cdot HCl$ ) per mL.

*Assay preparation 2* (where the label states the amount of chlortetracycline in the immediate container)—Transfer the contents of 1 container of Powder to an accurately measured volume of 0.01 N hydrochloric acid sufficient to obtain a solution containing not less than 1000  $\mu$ g of chlortetracycline hydrochloride ( $C_{22}H_{23}ClN_2O_8 \cdot HCl$ ) per mL.

*Procedure*—Proceed with Powder as directed for chlortetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively and stepwise with water to yield a *Test Dilu-*

tion having a concentration assumed to be equal to the median dose level of the Standard.

## Chlortetracycline Hydrochloride Tablets

» Chlortetracycline Hydrochloride Tablets contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{22}H_{23}ClN_2O_8 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers, protected from light.

**Labeling**—Label the Tablets to indicate that they are intended for veterinary use only.

### USP Reference standards (11)—

USP Chlortetracycline Hydrochloride RS

USP Oxytetracycline RS

USP Tetracycline Hydrochloride RS

**Identification**—Shake a suitable quantity of finely ground Tablet powder with methanol to obtain a solution containing about 0.5 mg of chlortetracycline hydrochloride per mL, and filter. Using the filtrate so obtained as the *Test solution*, and a methanol solution containing in each mL 0.5 mg of USP Chlortetracycline Hydrochloride RS, 0.5 mg of USP Oxytetracycline RS, and 0.5 mg of USP Tetracycline Hydrochloride RS as the *Resolution solution*, proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

**Disintegration** (701): 1 hour, simulated gastric fluid TS being used as the test medium in place of water.

**Uniformity of dosage units** (905): meet the requirements for *Weight Variation*.

**Water, Method I** (921): not more than 3.0%, or where the Tablets have a diameter of greater than 15 mm, not more than 6.0%, a quantity of finely ground Tablet powder, accurately weighed, being used.

**Assay**—Transfer not less than 5 Tablets to a high-speed glass blender jar containing an accurately measured volume of 0.01 N hydrochloric acid, so that after blending for 3 to 5 minutes a solution of convenient concentration is obtained. Proceed as directed for chlortetracycline under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of this solution diluted quantitatively and stepwise with water to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Chlorthalidone

$C_{14}H_{11}ClN_2O_4S$  338.77

Benzenesulfonamide, 2-chloro-5-(2,3-dihydro-1-hydroxy-3-oxo-1H-indol-1-yl)-.

2-Chloro-5-(1-hydroxy-3-oxo-1-isoindolinyl)benzenesulfonamide [77-36-1].

» Chlorthalidone contains not less than 98.0 percent and not more than 102.0 percent of  $C_{14}H_{11}ClN_2O_4S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Chlorthalidone RS

USP Chlorthalidone Related Compound A RS

4'-Chloro-3'-sulfamoyl-2-benzophenone carboxylic acid.

### Identification—

**A: Infrared Absorption** (197M).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 100 µg per mL.

*Medium:* 2 N hydrochloric acid in methanol (1 in 50).

Absorptivities at 275 nm, calculated on the dried basis, do not differ by more than 4.0%.

**C:** Dissolve about 50 mg in 3 mL of sulfuric acid: an intense yellow color develops.

**Loss on drying** (731)—Dry about 2 g, accurately weighed, at 105° for 4 hours: it loses not more than 0.4% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chloride** (221)—Shake 1.0 g with 40 mL of water for 5 minutes, and filter through chloride-free filter paper previously rinsed with water: the filtrate shows no more chloride than corresponds to 0.50 mL of 0.020 N hydrochloric acid (0.035%).

**Heavy metals, Method II** (231): 0.001%.

**Limit of chlorthalidone related compound A**—Proceed as directed in the *Assay*, except to calculate the percentage of chlorthalidone related compound A in the portion of Chlorthalidone taken by the formula:

$$0.1(C_R / C_T)(R_U / R_S)$$

in which  $C_R$  is the concentration, in µg per mL, of USP Chlorthalidone Related Compound A RS in the *Standard preparation*;  $C_T$  is the concentration, in mg per mL, of Chlorthalidone in the *Assay preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of chlorthalidone related compound A to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively: not more than 1.0% is present. [NOTE—USP Chlorthalidone Related Compound A RS is 4'-chloro-3'-sulfamoyl-2-benzophenone carboxylic acid (CCA).]

### Assay—

**Mobile phase**—Prepare a suitable degassed mixture of 0.01 M dibasic ammonium phosphate and methanol (3:2), adjust dropwise with phosphoric acid to a pH of  $5.5 \pm 0.1$ , and filter.

**Internal standard solution**—Prepare a solution of 2,7-naphthalenediol in methanol having a concentration of about 1.0 mg per mL.

**Chlorthalidone related compound A solution**—Prepare a solution of USP Chlorthalidone Related Compound A RS in methanol having a known concentration of about 5 µg per mL.

**Standard preparation**—Prepare a solution of USP Chlorthalidone RS in methanol having a known concentration of about 1 mg per mL. Pipet 5 mL of this solution into a 50-mL volumetric flask containing 5.0 mL of *Internal standard solution* and 10.0 mL of *Chlorthalidone related compound A solution*. Dilute with water to volume, and mix. This solution contains about 0.1 mg of chlorthalidone and about 1 µg of chlorthalidone related compound A per mL.

**Assay preparation**—Transfer about 50 mg of Chlorthalidone, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 5 mL of this solution into a 50-mL volumetric flask containing 5.0 mL of *Internal standard solution* and 10.0 mL of methanol. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and re-

cord the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for chlorthalidone related compound A, 0.8 for chlorthalidone, and 1.0 for the internal standard; the resolution,  $R$ , between chlorthalidone and chlorthalidone related compound A, and between chlorthalidone and the internal standard is not less than 1.5; the tailing factor for chlorthalidone and chlorthalidone related compound A is not more than 2.0; and the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{14}H_{11}ClN_2O_4S$  in the portion of Chlorthalidone taken by the formula:

$$500C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chlorthalidone RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of chlorthalidone to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorthalidone Tablets

» Chlorthalidone Tablets contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $C_{14}H_{11}ClN_2O_4S$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Chlorthalidone RS

### Identification—

**A:** Digest a quantity of powdered Tablets, equivalent to about 100 mg of chlorthalidone, with 10 mL of acetone on a steam bath for about 5 minutes. Filter the solution into a 50-mL beaker, add 20 mL of water, and boil on the steam bath for about 5 minutes, passing a gentle current of air above the solution to remove the acetone. Cool in an ice bath, filter, and dry the crystals at 105° for 4 hours: the crystals so obtained respond to *Identification test A* under *Chlorthalidone*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 60 minutes.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorthalidone RS in methanol to obtain a solution having a known concentration of about 5 mg per mL.

*Procedure*—Determine the amount of  $C_{14}H_{11}ClN_2O_4S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 275 nm of filtered portions of the solution under test, suitably diluted with water, in comparison with a quantitative dilution in water of the *Standard preparation* having a known concentration of USP Chlorthalidone RS comparable to the concentration of the solution under test.

*Tolerances*—Not less than 70% (Q) of the labeled amount of  $C_{14}H_{11}ClN_2O_4S$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*Mobile phase* and *Internal standard solution*—Prepare as directed in the *Assay* under *Chlorthalidone*.

*Standard preparation*—Prepare as directed in the *Assay* under *Chlorthalidone*, except to substitute 10.0 mL of methanol for the *CCA solution*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of Chlorthalidone, to a 100-mL volumetric flask. Dissolve in about 50 mL of methanol, shake for 30 minutes, dilute with methanol to volume, and mix. Transfer about 30 mL of this solution to a 50-mL centrifuge tube, and centrifuge for 10 minutes. Pipet 5 mL of the clear supernatant into a 50-mL volumetric flask containing 5.0 mL of *Internal standard solution* and 10.0 mL of methanol. Dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 2.0%, and the resolution factor between chlorthalidone and the internal standard is not less than 1.5. The tailing factors for the chlorthalidone and internal standard peaks are not more than 2.0.

*Procedure*—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.8 for chlorthalidone and 1.0 for the internal standard. Calculate the quantity, in mg, of  $C_{14}H_{11}ClN_2O_4S$  in the portion of Tablets taken by the formula:

$$1000C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Chlorthalidone RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of chlorthalidone to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Chlorzoxazone

$C_7H_4ClNO_2$  169.57

2(3*H*)-Benzoxazolinone, 5-chloro-

5-Chloro-2-benzoxazolinone [95-25-0].

» Chlorzoxazone contains not less than 98.0 percent and not more than 102.0 percent of  $C_7H_4ClNO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Chlorzoxazone RS

USP Chlorzoxazone Related Compound A RS

2-Amino-4-chlorophenol.

$C_6H_6ClNO$  143.57

**Identification—**

**A:** *Infrared Absorption* (197K): previously dried.

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 20 µg per mL.

*Medium:* methanol.

**Melting range** (741): between 189° and 194°.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Heavy metals, Method II** (231): 0.002%.

**Residue on ignition** (281): not more than 0.15%.

**Chromatographic purity**—Prepare a *Test solution* in methanol containing 20 mg per mL. Dissolve a suitable quantity of USP Chlorzoxazone Related Compound A RS (2-Amino-4-chlorophenol) in methanol to obtain a solution containing 100 µg per mL (*Standard solution A*). Dissolve a suitable quantity of *p*-chlorophenol in methanol to obtain a solution containing 50 µg per mL (*Standard solution B*). Apply separate 10 µL portions of the three solutions to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of hexane and dioxane (63:37) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: any spot obtained from the *Test solution*, other than one corresponding to chlorzoxazone, does not exceed, in size or intensity, the principal spot obtained from *Standard solution A*, corresponding to not more than 0.5% of any individual impurity. Expose the plate to iodine vapors in a closed chamber, and locate the spots: any spot obtained from the *Test solution*, other than one corresponding to chlorzoxazone, does not exceed, in size or intensity, the principal spot obtained from *Standard solution B*, corresponding to not more than 0.25% of any individual impurity.

**Chlorine content**—Dissolve about 300 mg, accurately weighed, in 10 mL of alcohol in a suitable flask. Add 3.5 g of Raney's nickel-aluminum catalyst, and connect to a suitable reflux condenser. Chill the flask in an ice bath, and add through the condenser 75 mL of 2.5 N sodium hydroxide. When the reaction has subsided, remove the ice bath. After 10 minutes, heat the flask gently, gradually increasing the heat until the mixture refluxes rapidly. After 90 minutes from the time of the addition of the alkali, discontinue heating, cool, and rinse the condenser with water, collecting the rinsings in the flask. Transfer the liquid to a 200-mL volumetric flask, wash the residue with water, and add the washing to the volumetric flask. Dilute with water to volume, and mix. Transfer 100.0 mL of this solution to a beaker, neutralize, then acidify (using congo red as the indicator) by adding nitric acid dropwise with mixing. Titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, using silver and calomel electrodes. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl: the content of Cl, calculated on the dried basis, is between 20.6% and 21.2%.

**Assay**—Transfer about 50 mg of Chlorzoxazone, accurately weighed, to a 100-mL volumetric flask. Dissolve in methanol, dilute with methanol to volume, and mix. Transfer 4.0 mL of this solution to a 100-mL volumetric flask, dilute with methanol to volume, and mix. Concomitantly determine the absorbances of this solution and a Standard solution of USP Chlorzoxazone RS in methanol at a concentration of about 20 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 282 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate

the quantity, in mg, of C<sub>7</sub>H<sub>4</sub>ClNO<sub>2</sub> in the Chlorzoxazone taken by the formula:

$$2.5C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Chlorzoxazone RS in the Standard solution; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the solution of Chlorzoxazone and the Standard solution, respectively.

## Chlorzoxazone Tablets

» Chlorzoxazone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>7</sub>H<sub>4</sub>ClNO<sub>2</sub>.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Chlorzoxazone RS

**Identification—**

**A:** Disperse a portion of powdered Tablets, equivalent to about 100 mg of chlorzoxazone, in 100 mL of methanol, shake for 15 minutes, and filter. Transfer 2.0 mL of the filtrate to a 100-mL volumetric flask, dilute with methanol to volume, and mix: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Chlorzoxazone RS, concomitantly measured.

**B:** The chromatogram of the *Assay preparation* obtained in the *Assay* exhibits a major peak for chlorzoxazone, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained in the *Assay*.

**Dissolution** (711)—[NOTE—Use 2-liter vessels for this test.]

*Medium:* pH 6.8 phosphate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 1800 mL.

*Apparatus 2:* 75 rpm.

*Time:* 60 minutes.

*Procedure*—Determine the amount of C<sub>7</sub>H<sub>4</sub>ClNO<sub>2</sub> dissolved by employing UV absorption at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, diluted with *Medium*, if necessary, in comparison with a Standard solution of USP Chlorzoxazone RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of C<sub>7</sub>H<sub>4</sub>ClNO<sub>2</sub> is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay—**

*1% Acetic acid solution*—Dilute 10 mL of glacial acetic acid with water to make 1000 mL of solution.

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (70:30:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Prepare a solution of phenacetin in acetonitrile containing about 1.25 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Chlorzoxazone RS quantitatively in *Mobile phase* to obtain a stock solution having a known concentration of about 1.25 mg per mL. Transfer 5.0 mL of this stock solution to a 50-mL volumetric flask containing 10.0 mL of *Internal standard solution*, dilute with *1% Acetic acid solution* to volume, and mix.

*Resolution solution*—Prepare a solution of *p*-chlorophenol in acetonitrile containing about 8.5 mg per mL. Transfer

1 mL of this solution to a 50-mL volumetric flask containing 4 mL of the stock solution used to prepare the *Standard preparation* and 10 mL of *Internal standard solution*, dilute with 1% *Acetic acid solution* to volume, and mix.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 125 mg of chlorzoxazone, to a 100-mL volumetric flask, add about 70 mL of acetonitrile, and shake by mechanical means for about 30 minutes. Dilute with acetonitrile to volume, and mix. Filter a portion of this solution, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of the clear filtrate to a 50-mL volumetric flask containing 10.0 mL of *Internal standard solution*, dilute with 1% *Acetic acid solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 4-mm × 30-cm column containing packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.7 for phenacetin, 1.0 for chlorzoxazone, and 1.2 for *p*-chlorophenol; and the resolution, *R*, between the chlorzoxazone peak and the *p*-chlorophenol peak is not less than 2.0. Chromatograph the *Standard preparation*, and record the responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of C<sub>7</sub>H<sub>4</sub>ClNO<sub>2</sub> in the portion of Tablets taken by the formula:

$$1000C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Chlorzoxazone RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios of the chlorzoxazone peak to the phenacetin peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cholecalciferol

C<sub>27</sub>H<sub>44</sub>O 384.64  
9,10-Secocholesta-5,7,10(19)-trien-3-ol, (3β,5Z,7E)-;  
Cholecalciferol [67-97-0].

### DEFINITION

Cholecalciferol contains NLT 97.0% and NMT 103.0% of cholecalciferol (C<sub>27</sub>H<sub>44</sub>O).

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>  
Wavelength range: 2–12 µm
- **B. ULTRAVIOLET ABSORPTION** <197U>  
Analytical wavelength: 265 nm  
Sample solution: 10 µg/mL in alcohol  
Acceptance criteria: Meets the requirements in the chapter. Absorptivities do not differ by more than 3.0%.

- **C.**  
**Sample solution:** 0.5 mg in 5 mL of chloroform  
**Analysis:** Add 0.3 mL of acetic anhydride and 0.1 mL of sulfuric acid to the *Sample solution*, and shake vigorously.  
**Acceptance criteria:** A bright red color is produced, and it rapidly changes through violet and blue to green.
- **D. THIN-LAYER CHROMATOGRAPHY**  
[NOTE—For the *Standard solution* and the *Sample solution*, follow these procedures: use low-actinic glassware, dissolve the samples without heating, and use the solutions immediately.]  
**Diluent:** 10 mg/mL of squalane in chloroform  
**Standard solution:** 50 mg/mL of USP Cholecalciferol RS in *Diluent*  
**Sample solution:** 50 mg/mL of Cholecalciferol in *Diluent*  
**Chromatographic system**  
(See *Chromatography* <621>, *Thin-Layer Chromatography*.)  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture  
**Application volume:** 10 µL  
**Developing solvent system:** Cyclohexane and diethyl ether (1:1)  
**Spray reagent:** 20 mg/mL of acetyl chloride in anti-mony trichloride TS  
**Analysis**  
**Samples:** *Standard solution* and *Sample solution*  
[NOTE—Perform the development and subsequent operations in the dark.]  
Place the plate in a chamber containing and equilibrated with *Developing solvent system*. Develop until the solvent front has moved about 15 cm above the line of application. Remove the plate, allow the solvent to evaporate, and spray with *Spray reagent*.  
**Acceptance criteria:** The *Sample solution* shows a yellowish-orange area (cholecalciferol) having the same *R<sub>F</sub>* value as the area of the *Standard solution* and may show below the cholecalciferol area a violet area, attributed to 7-dehydrocholesterol.

### ASSAY

- **PROCEDURE**  
**Dehydrated hexane:** Prepare a chromatographic column by packing a chromatographic tube, 8 cm × 60 cm, with 500 g of 50- to 250-µm chromatographic siliceous earth, activated by drying at 150° for 4 h. (See *Chromatography* <621>, *Column Chromatography*.) Pass 500 mL of hexane through the column, and collect the eluate in a glass-stoppered flask.  
**Mobile phase:** *n*-Amyl alcohol in *Dehydrated hexane* (3 in 1000)  
**System suitability solution:** 250 mg of USP Vitamin D Assay System Suitability RS in 10 mL of a mixture of toluene and *Mobile phase* (1:1). Heat this solution, under reflux, at 90° for 45 min, and cool. [NOTE—This solution contains cholecalciferol, precholecalciferol, and *trans*-cholecalciferol.]  
[NOTE—For the stock solutions, follow these procedures: use low-actinic glassware, dissolve the samples without heating, and prepare the solutions fresh daily.]  
**Standard stock solution:** 0.6 mg/mL of USP Cholecalciferol RS in toluene  
**Standard solution:** 120 µg/mL of USP Cholecalciferol RS in *Mobile phase*, prepared from *Standard stock solution*  
**Sample stock solution:** 0.6 mg/mL of Cholecalciferol in toluene  
**Sample solution:** 120 µg/mL of Cholecalciferol in *Mobile phase*, prepared from *Sample stock solution*  
**Chromatographic system**  
(See *Chromatography* <621>, *System Suitability*.)  
**Mode:** LC  
**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Injection size:** 5–10 µL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for precholecalciferol, *trans*-cholecalciferol, and cholecalciferol are 0.4, 0.5, and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.0 between *trans*-cholecalciferol and precholecalciferol

**Relative standard deviation:** NMT 2.0% for the peak response of cholecalciferol

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cholecalciferol ( $C_{27}H_{44}O$ ) in the portion of Cholecalciferol taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cholecalciferol RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Cholecalciferol in the *Sample solution* (µg/mL)

**Acceptance criteria:** 97.0%–103.0%

**SPECIFIC TESTS**

• **OPTICAL ROTATION, Specific Rotation (781S)**

**Sample solution:** 5 mg/mL in alcohol. [NOTE—Prepare and use the solution without delay. Use Cholecalciferol from a container opened not longer than 30 min.]

**Acceptance criteria:** +105° to +112°

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in hermetically sealed containers under nitrogen, and store in a cool place protected from light.
- **USP REFERENCE STANDARDS (11)**  
USP Cholecalciferol RS  
USP Vitamin D Assay System Suitability RS

## Cholecalciferol Solution

**DEFINITION**

Cholecalciferol Solution is a solution of Cholecalciferol in an edible vegetable oil, in Polysorbate 80, or in Propylene Glycol. It contains NLT 90.0% and NMT 120.0% of the labeled amount of vitamin D as cholecalciferol ( $C_{27}H_{44}O$ ).

**ASSAY**

• **PROCEDURE**

**Mobile phase:** Hexane and pentanol (997:3)

**Standard stock solution:** Dissolve USP Cholecalciferol RS in toluene, and dilute with *Mobile phase* to 50 µg/mL. [NOTE—Prepare this solution fresh daily.]

**Standard solution A:** 5 µg/mL from *Standard stock solution* in *Mobile phase*. [NOTE—Store at a temperature not above 0°.]

**Standard solution B:** Transfer 5.0 mL of *Standard stock solution* to a round-bottom flask fitted with a reflux condenser. Displace the air with nitrogen, and reflux for 1 h in a water bath under a nitrogen atmosphere to obtain a solution containing cholecalciferol and precholecalciferol. Cool, transfer the solution with the aid of several portions of *Mobile phase* to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Sample solution:** Equivalent to 5 µg/mL of cholecalciferol in *Mobile phase* from an accurately measured volume of Cholecalciferol Solution

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Flow rate:** 2 mL/min

**Injection size:** 10 µL

**System suitability**

**Sample:** *Standard solution B*

[NOTE—The relative retention times for precholecalciferol and cholecalciferol are about 0.4 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.0 between the precholecalciferol peak and the cholecalciferol peak

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

**Cholecalciferol response factor**

Calculate the cholecalciferol response factor,  $F_C$ :

$$F_C = C_S/r_S$$

$C_S$  = concentration of USP Cholecalciferol RS in *Standard solution A* (µg/mL)

$r_S$  = peak area of cholecalciferol from *Standard solution A*

**Pre-cholecalciferol response factor**

Calculate the concentration,  $C'_S$ , in µg/mL, of cholecalciferol in *Standard solution B*:

$$C'_S = F_C \times r'_S$$

$F_C$  = response factor for cholecalciferol

$r'_S$  = peak area of cholecalciferol from *Standard solution B*

Calculate the concentration,  $C'_{pre}$ , in µg/mL, of pre-cholecalciferol:

$$C'_{pre} = C_S - C'_S$$

$C_S$  = concentration of USP Cholecalciferol RS in *Standard solution A* (µg/mL)

$C'_S$  = concentration of cholecalciferol in *Standard solution B* (µg/mL)

Calculate the response factor,  $F_{pre}$ , for pre-cholecalciferol:

$$F_{pre} = C'_{pre}/r_p$$

$C'_{pre}$  = concentration of pre-cholecalciferol (µg/mL)

$r_p$  = peak response of pre-cholecalciferol from *Standard solution B*

**Content of vitamin D**

Calculate the percentage of the labeled amount of vitamin D as cholecalciferol ( $C_{27}H_{44}O$ ) in the portion of the Cholecalciferol Solution taken:

$$\text{Result} = \{[(F_C \times r_C) + (F_{pre} \times r_{pre})]/C_U\} \times 100$$

$F_C$  = response factor for cholecalciferol

$r_C$  = peak area of cholecalciferol from the *Sample solution*

$F_{pre}$  = response factor for pre-cholecalciferol

$r_{pre}$  = peak area of pre-cholecalciferol from the *Sample solution*

$C_U$  = nominal concentration of cholecalciferol in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–120.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

- **LABELING:** Label it to indicate the concentration, in mg/mL, of cholecalciferol. Label it also to state that it is to be used for manufacturing only.
- **USP REFERENCE STANDARDS** (11)  
USP Cholecalciferol RS

## Cholestyramine Resin

Cholestyramine.

Cholestyramine [11041-12-6].

» Cholestyramine Resin is a strongly basic anion-exchange resin in the chloride form, consisting of styrene-divinylbenzene copolymer with quaternary ammonium functional groups. Each g exchanges not less than 1.8 g and not more than 2.2 g of sodium glycocholate, calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cholestyramine Resin RS

**Identification**—*Infrared Absorption* (197K).

**pH** (791): between 4.0 and 6.0, in a slurry (1 in 100).

**Loss on drying** (731)—Dry over phosphorus pentoxide at a pressure not exceeding 50 mm of mercury at 70° for 16 hours: it loses not more than 12.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Dialyzable quaternary amines**—

*pH 9.2 Buffer*—Transfer 3.80 g of sodium borate decahydrate to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Bromothymol blue solution*—Transfer 150 mg of bromothymol blue and 405 mg of sodium carbonate to a 100-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution*—Take 1 mL of 60% benzyltrimethylammonium chloride solution, accurately pipeted, and dilute quantitatively, and stepwise, with water to obtain a stock solution having a concentration of  $0.2 \pm 0.01$  mg per mL [NOTE—Prepare this solution fresh]. Cut a 20- to 25-cm piece of cellulose dialysis tubing\* having a molecular weight cut-off that falls within the 6,000 to 14,000 range and a dry flat width of 5 to 9 cm, and place it in water to hydrate until pliable, appropriately sealing one end. Pipet 5 mL of the stock solution into the tubing, add 5 mL of water, appropriately seal the open end, place the tube in a suitable vessel containing 100 mL of water so that it is completely immersed in the water, and stir the fluid for 16 hours to effect dialysis.

*Test solution*—Cut a 20- to 25-cm piece of cellulose dialysis tubing\* having a molecular weight cut-off that falls within the 6,000 to 14,000 range and a dry flat width of 5 to 9 cm, and place it in water to hydrate until pliable, appropriately sealing one end. Weigh  $2 \pm 0.01$  g of Cholestyramine Resin, and carefully transfer the specimen into the tubing, taking care to ensure that none adheres to the upper walls of the tubing. Add 10 mL of water to the contents of the tube, appropriately seal the open end, and place the tube in a suitable vessel containing 100 mL of water so that it is completely immersed in the water. Stir the fluid for 16 hours to effect dialysis.

*Procedure*—Pipet the following into each of three separators: Separator 1—5 mL of *Standard solution*, 5 mL of *pH 9.2 Buffer*, 1 mL of *Bromothymol blue solution*, and 10 mL

of chloroform; Separator 2—5 mL of *Test solution*, 5 mL of *pH 9.2 Buffer*, 1 mL of *Bromothymol blue solution*, and 10 mL of chloroform; Separator 3—5 mL of water, 5 mL of *pH 9.2 Buffer*, 1 mL of *Bromothymol blue solution*, and 10 mL of chloroform. Shake each separator vigorously for 1 minute, allow the phases to separate until the chloroform phase is clear, and collect the chloroform extracts in separate 25-mL volumetric flasks. Repeat the extraction process with a second 10-mL portion of chloroform, and combine with the previous extracts. Dilute each solution with chloroform to volume, if necessary, and mix. Concomitantly determine the absorbances of the *Test solution* and the *Standard solution* at the wavelength of maximum absorbance at about 420 nm, with a suitable spectrophotometer, using the solution from Separator 3 as the blank: the absorbance of the *Test solution* does not exceed that of the *Standard solution* (0.05% as benzyltrimethylammonium chloride).

**Chloride content**—To about 750 mg of Cholestyramine Resin, accurately weighed, add 100 mL of water and 50 mg of potassium nitrate. Add, with stirring, 2 mL of nitric acid, and titrate with 0.1 N silver nitrate VS, determining the endpoint potentiometrically, and using a silver-glass electrode system. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of Cl. Not less than 13.0% and not more than 17.0% of Cl, calculated on the dried basis, is found.

**Exchange capacity**—

*Mobile phase*—Prepare a filtered and degassed mixture of 0.08 M monobasic potassium phosphate and acetonitrile (65:35). Adjust with phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Potassium phosphate buffer*—Transfer about 4 g of monobasic potassium phosphate and about 12 g of dibasic potassium phosphate to a 1-liter volumetric flask. Dissolve in and dilute with water to volume, and mix.

*Sodium glycocholate solution*—Transfer about 15 g of sodium glycocholate to a 500-mL volumetric flask, and dissolve in and dilute with *Potassium phosphate buffer* to volume.

*Reference solution*—Pipet 4.0 mL of *Sodium glycocholate solution* into a 100-mL volumetric flask, and dilute with water to volume.

*Standard solution*—Transfer about 100 mg of USP Cholestyramine Resin RS, accurately weighed, to a 25-mL conical flask. Pipet 15.0 mL of *Sodium glycocholate solution* into the flask, and stir by mechanical means for 2 hours. Transfer the contents to a centrifuge tube, and centrifuge for 15 minutes. Transfer 5.0 mL of the supernatant to a 50-mL volumetric flask, and dilute with water to volume.

*System suitability solution*—Prepare a solution in water containing, in each mL, about 0.6 mg of sodium glycocholate and about 0.3 mg of taurodeoxycholic acid.

*Test solution*—Transfer about 100 mg of anhydrous Cholestyramine Resin, accurately weighed, to a 25-mL conical flask. Pipet 15.0 mL of *Sodium glycocholate solution* into the flask, and stir by mechanical means for 2 hours. Transfer the contents to a centrifuge tube, and centrifuge for 15 minutes. Transfer 5.0 mL of the supernatant to a 50-mL volumetric flask, and dilute with water to volume.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 214-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between sodium glycocholate and taurodeoxycholic acid is not less than 1.5. Chromatograph the *Reference solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Reference solution*, the *Standard solution*, and the *Test*

\*A suitable tubing is Spectra/Por 1, Item # 132 665, available from Spectrum Laboratories, Inc. (www.spectrum.com), or equivalent.

solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of sodium glycocholate absorbed on each g of the Resin taken by the formula:

$$M(2.5r_R - r_U)W_S / (2.5r_R - r_S)W_U$$

in which *M* is the stated value, in mg, of sodium glycocholate absorbed per g of USP Cholestyramine Resin RS; *r<sub>R</sub>*, *r<sub>U</sub>*, and *r<sub>S</sub>* are the peak responses obtained from the *Reference solution*, the *Test solution*, and the *Standard solution*, respectively; *W<sub>U</sub>* is the weight, in mg, of Cholestyramine Resin, calculated on the dried basis, taken to prepare the *Test solution*; and *W<sub>S</sub>* is the weight, in mg, of USP Cholestyramine Resin RS taken to prepare the *Standard solution*.

## Cholestyramine for Oral Suspension

» Cholestyramine for Oral Suspension is a mixture of Cholestyramine Resin with suitable excipients and coloring and flavoring agents. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of dried cholestyramine resin.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Cholestyramine Resin RS

**Identification**—Transfer a quantity of Cholestyramine for Oral Suspension, equivalent to about 500 mg of dried cholestyramine resin, to a suitable flask, add 100 mL of 0.1 N hydrochloric acid, stir to suspend the solid, and heat on a steam bath for 10 minutes. Filter, wash the residue with three 50-mL portions of water, and dry at 70° and at a pressure not exceeding 50 mm of mercury for 16 hours: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cholestyramine Resin RS.

**Uniformity of dosage units** (905): meets the requirements for *Weight Variation*.

**Assay**—

*Mobile phase, Potassium phosphate buffer, Sodium glycocholate solution, Reference solution, Standard solution, System suitability solution, and Chromatographic system*—Proceed as directed in the test for *Exchange capacity* under *Cholestyramine Resin*.

*Test solution*—Transfer an accurately weighed portion of Cholestyramine for Oral Suspension, equivalent to about 100 mg of cholestyramine resin, to a 25-mL conical flask. Pipet 15.0 mL of *Sodium glycocholate solution* into the flask, and stir by mechanical means for 2 hours. Transfer the contents to a centrifuge tube, and centrifuge for 15 minutes. Transfer 5.0 mL of the supernatant to a 50-mL volumetric flask, and dilute with water to volume.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Reference solution*, the *Standard solution*, and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cholestyramine resin per mg of Cholestyramine for Oral Suspension taken by the formula:

$$[M(2.5r_R - r_U)W_S] / [(2.5r_R - r_S)W_UQ]$$

in which *M* is the stated value, in mg, of sodium glycocholate absorbed per g of USP Cholestyramine Resin RS; *r<sub>R</sub>*, *r<sub>U</sub>*, and *r<sub>S</sub>* are the peak responses obtained from the *Reference solution*, the *Test solution*, and the *Standard solution*, respectively; *W<sub>S</sub>* is the weight, in mg, of USP Cholestyramine Resin

RS taken to prepare the *Standard solution*; *W<sub>U</sub>* is the weight, in mg, of Cholestyramine for Oral Suspension taken to prepare the *Test solution*; and *Q* is the quantity of sodium glycocholate absorbed per g of dried cholestyramine resin, as obtained in the test for *Exchange capacity* under *Cholestyramine Resin*.

## Chromic Chloride

CrCl<sub>3</sub> · 6H<sub>2</sub>O 266.45

Chromium chloride (CrCl<sub>3</sub>) hexahydrate;  
Chromium(3+) chloride hexahydrate [10060-12-5].

CrCl<sub>3</sub> 158.36  
Anhydrous [10025-73-7].

### DEFINITION

Chromic Chloride contains NLT 98.0% and NMT 101.0% of CrCl<sub>3</sub> · 6H<sub>2</sub>O.

### IDENTIFICATION

- **A.**  
**Analysis:** To 5 mL of a solution (1 in 250) in a test tube, add 1 mL of 5 N sodium hydroxide and 10 drops of 30% hydrogen peroxide, and heat gently for about 2 min.  
**Acceptance criteria:** A yellow color develops.
- **B.**  
**Analysis:** To 5 mL of a solution (1 in 250) in a test tube, add 5 drops of silver nitrate TS.  
**Acceptance criteria:** A white, curdy precipitate that is insoluble in nitric acid is formed.

### ASSAY

#### PROCEDURE

**Sample solution:** Dissolve 0.4 g of Chromic Chloride in 100 mL of water contained in a glass-stoppered, 500-mL conical flask. Add 5 mL of 5 N sodium hydroxide, and mix. Pipet slowly 4 mL of 30% hydrogen peroxide into the flask, and boil the solution for 5 min. Cool the solution slightly, and add 5 mL of nickel sulfate solution (1 in 20). Boil the solution until no more oxygen is evolved. Cool, and add 2 N sulfuric acid dropwise until the color of the solution changes from yellow to orange. Add to the flask a freshly prepared solution of 4 g of potassium iodide and 2 g of sodium bicarbonate in 100 mL of water, then add 6 mL of hydrochloric acid. Immediately insert the stopper in the flask, and allow to stand in the dark for 10 min. Rinse the stopper and the sides of the flask with a few mL of water.

**Analysis:** Titrate the liberated iodine with 0.1 N sodium thiosulfate VS to an orange color. Add 3 mL of starch TS, and continue the titration to a blue-green endpoint. Each mL of 0.1 N sodium thiosulfate is equivalent to 8.882 mg of chromium chloride hexahydrate (CrCl<sub>3</sub> · 6H<sub>2</sub>O).

**Acceptance criteria:** 98.0%–101.0%

### IMPURITIES

#### CHLORIDE AND SULFATE, Sulfate (221)

**Sample solution:** Dissolve 2.0 g of Chromic Chloride in 10 mL of water. Add 1 mL of 3 N hydrochloric acid, and filter if necessary to obtain a clear solution. Wash the filter with two 5-mL portions of water, and dilute with water to 40 mL.

**Control solution:** Prepare as directed in the *Sample solution*, but use 1.0 g of the substance under test. After the filtration step, add 0.10 mL of 0.020 N sulfuric acid.

**Analysis:** To each solution add 3 mL of barium chloride TS, mix, and allow to stand overnight. Decant most of the supernatants, without disturbing the precipitates, but leaving twice the volume of liquid in the *Control*

solution as in the *Sample solution*. Dilute each solution with water to 25 mL, and sonicate for 1 min.

**Acceptance criteria:** Any turbidity in the *Sample solution* does not exceed that in the *Control solution* (0.01%).

• **IRON (241)**

**Test preparation:** Dissolve 1.0 g of Chromic Chloride in 100 mL of water. Transfer 10 mL of this solution to a 100-mL color comparison tube. Dilute with water to 45 mL, add 2 mL of hydrochloric acid, and mix.

**Analysis:** Proceed as directed for *Procedure*, except add 15 mL of butyl alcohol to the *Test preparation* and the *Standard Preparation* at the same time that the *Ammonium Thiocyanate Solution* is added. Shake for 30 s, and allow the layers to separate.

**Acceptance criteria:** The color in the upper butyl alcohol layer from the *Test preparation* is not darker than that from the *Standard Preparation* (NMT 0.01%).

**SPECIFIC TESTS**

• **INSOLUBLE MATTER**

**Sample:** 10 g

**Analysis:** Transfer the *Sample* to a 250-mL beaker. Add 100 mL of water, cover the beaker, and heat to boiling. Digest the hot solution on a steam bath for 30 min, and filter through a tared filtering crucible of fine porosity. Rinse the beaker with hot water, passing the rinsings through the filter, and wash the filter with hot water until the last washing is colorless. Dry the filter at 105°.

**Acceptance criteria:** The weight of the residue does not exceed 1 mg (0.01%).

• **SUBSTANCES NOT PRECIPITATED BY AMMONIUM HYDROXIDE**

**Sample:** 2.0 g

**Analysis:** Dissolve the *Sample* in 80 mL of water, heat the solution to boiling, and add a slight excess of ammonium hydroxide. Continue heating to remove the excess ammonia. Cool, dilute with water to 100.0 mL, and mix. Pass through a retentive filter, and transfer 50.0 mL of the clear filtrate to an evaporating dish that previously has been ignited and tared. Add 0.5 mL of sulfuric acid to the filtrate, and evaporate on a steam bath to dryness. Heat gently to remove the excess acid, and ignite gently.

**Acceptance criteria:** The weight of the residue does not exceed 2.0 mg (0.20% as sulfate).

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

## Chromic Chloride Injection

» Chromic Chloride Injection is a sterile solution of Chromic Chloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of chromium (Cr).

**Packaging and storage—**Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**Labeling—**Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration.

**USP Reference standards (11)—**

USP Endotoxin RS

**Identification—**The *Assay preparation*, prepared as directed in the *Assay*, exhibits an absorption maximum at about 360 nm when tested as directed for *Procedure* in the *Assay*.

**Bacterial endotoxins (85)—**It contains not more than 16.70 USP Endotoxin Units per µg of chromium.

**pH (791):** between 1.5 and 2.5.

**Other requirements—**It meets the requirements under *Injections* (1).

**Assay—**

**Sodium chloride solution—**Dissolve 54 g of sodium chloride in water, dilute with water to 2000 mL, and mix.

**Chromium stock solution—**Transfer 2.829 g of potassium dichromate, accurately weighed, to a 1000-mL volumetric flask, dissolve in water, dilute with water to volume, and mix. This solution contains 1000 µg of chromium per mL. Store in a polyethylene bottle.

**Standard preparations—**Pipet 10 mL of the *Chromium stock solution* into a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 10.0 mL and 20.0 mL, respectively, of this stock solution to separate 100-mL volumetric flasks, and transfer 15.0 mL and 20.0 mL, respectively, of the stock solution to separate 50-mL volumetric flasks. Add 20 mL of *Sodium chloride solution* to each 100-mL volumetric flask, and 10 mL of *Sodium chloride solution* to each 50-mL volumetric flask, dilute the contents of each flask with water to volume, and mix. These *Standard preparations* contain, respectively, 1.0, 2.0, 3.0, and 4.0 µg of chromium per mL.

**Assay preparation—**Transfer an accurately measured volume of Injection, equivalent to about 60 µg of chromium, to a 25-mL volumetric flask. From the labeled amount of sodium chloride, if any, in the Injection, calculate the amount, in mg, of sodium chloride in the volume of Injection taken, and add sufficient *Sodium chloride solution* to bring the total sodium chloride content of the flask to 135 mg. Dilute with water to volume, and mix.

**Procedure—**Concomitantly determine the absorbances of the *Standard preparations* and the *Assay preparation* at the chromium emission line of 357.9 nm, with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a chromium hollow-cathode lamp and an air-acetylene flame, using a 1:5 dilution of the *Sodium chloride solution* as the blank. Plot the absorbances of the *Standard preparations* versus concentration, in µg per mL, of chromium, and draw the straight line best fitting the four plotted points. From the graph so obtained, determine the concentration, in µg per mL, of chromium in the *Assay preparation*. Calculate the quantity, in µg, of chromium in each mL of the Injection taken by the formula:

$$25C/V$$

in which C is the concentration, in µg per mL, of chromium in the *Assay preparation*, and V is the volume, in mL, of Injection taken.

## Sodium Chromate Cr 51 Injection

Chromic acid (H<sub>2</sub><sup>51</sup>CrO<sub>4</sub>), disodium salt.

Disodium chromate (Na<sub>2</sub><sup>51</sup>CrO<sub>4</sub>) [7775-11-3].

» Sodium Chromate Cr 51 Injection is a sterile solution of radioactive chromium (<sup>51</sup>Cr) processed in the form of sodium chromate in Water for Injection. For those uses where an isotonic solution is required, Sodium Chloride may be added in appropriate amounts as provided under *Injections* (1). Chromium 51 is produced by the neutron bombardment of enriched chromium 50.

Sodium Chromate Cr 51 Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of <sup>51</sup>Cr as

sodium chromate expressed in megabecquerels (millicuries) per mL at the time indicated in the labeling. The sodium chromate content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount. The specific activity is not less than 370 megabecquerels (10 millicuries) per mg of sodium chromate at the end of the expiry period. Other chemical forms of radioactivity do not exceed 10.0 percent of the total radioactivity.

**Packaging and storage**—Preserve in single-dose or in multiple-dose containers.

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of sodium chromate expressed in  $\mu\text{g}$  per mL; the amount of  $^{51}\text{Cr}$  as sodium chromate expressed as total megabecquerels (millicuries) and as megabecquerels (millicuries) per mL at the time of calibration; a statement to indicate whether the contents are intended for diagnostic or therapeutic use; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay and the quantity of chromium, and also indicates that the radioactive half-life of  $^{51}\text{Cr}$  is 27.8 days.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of  $^{51}\text{Cr}$  of known purity that exhibits a photopeak having an energy of 0.320 MeV.

**Bacterial endotoxins** (85)—It contains not more than 175/V USP Endotoxin Unit per mL of the Injection, when compared with the USP Endotoxin RS, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 7.5 and 8.5.

**Radiochemical purity**—Place a volume of Injection, appropriately diluted so that it provides a count rate of about 20,000 counts per minute, about 25 mm from one end of a 25- × 300-mm strip of chromatographic paper (see *Chromatography* (621)), and immediately develop with a mixture of 5 parts of water, 2 parts of dilute alcohol (9.5 in 10), and 1 part of ammonium hydroxide. Air-dry the chromatogram, and determine the radioactivity distribution by scanning the chromatogram with a suitable collimated radiation detector. The radioactivity of the chromate band is not less than 90.0% of the total radioactivity. The  $R_f$  value for the chromate band falls within  $\pm 10\%$  of the value found for a known sodium chromate specimen when determined under identical conditions.

**Other requirements**—It meets the requirements under *Injections* (1), except that it is not subject to the recommendation on *Container Content*.

**Assay for sodium chromate**—

*Standard stock preparation*—Dissolve 3.735 g of potassium chromate in 1000 mL of water to obtain a solution having a known concentration of 1.0 mg per mL of chromium.

*Standard preparation*—Pipet 0.25, 0.50, 0.75, 0.100, 0.125, and 0.150 mL of the *Standard stock preparation*, accurately measured, into separate 100-mL volumetric flasks. To each flask add 0.42 mL of 0.1 N sodium bicarbonate, and dilute with water to volume to obtain solutions having final concentrations of 0.25, 0.50, 0.75, 1.00, 1.25, and 1.50  $\mu\text{g}$  of chromium per mL.

*Assay preparation*—Use the Injection.

*Blank preparation*—Transfer 0.42 mL of 0.1 N sodium bicarbonate to a 100-mL volumetric flask, and dilute with water to volume.

*Procedure*—Concomitantly determine the absorbances of the *Assay preparation*, the *Standard preparations*, and the *Blank preparation* at the chromium emission line at 357.7 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-Scattering* (851)) equipped with a chromium hollow-cathode lamp and an air-acetylene (fuel-rich) flame using water to set the instrument to zero. Plot the absorbances of the *Standard preparations* and the *Blank preparation* versus concentration, in  $\mu\text{g}$  per mL, of chromium, and perform a regression analysis. A suitable standard curve will have an intercept between  $-0.002$  and  $+0.002$ , and a regression coefficient of not less than 0.99. Using the standard curve so obtained, determine the concentration, C, in  $\mu\text{g}$  per mL, of chromium in the Injection taken. Calculate the quantity of sodium chromate, in  $\mu\text{g}$  per mL, by the formula:

$$3.115C$$

in which 3.115 is the conversion factor.

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly under Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu\text{Ci}$ ) per mL, of Injection by use of a calibrated system as directed under *Radioactivity* (821).

## Chromium Cr 51 Edetate Injection

Glycine, *N,N'*-1,2-ethanedithylbis[*N*-(carboxymethyl)]-, chromium-51 complex.  
(Ethylenedinitrilo)tetraacetic acid, chromium-51 complex [27849-89-4].

» Chromium Cr 51 Edetate Injection is a sterile solution containing radioactive chromium ( $^{51}\text{Cr}$ ) in the form of a complex of chromium (III) with edetic acid, present in excess. It is made isotonic by the addition of Sodium Chloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{51}\text{Cr}$  as edetate complex expressed in megabecquerels (or microcuries or millicuries) per mL at the time indicated in the labeling. Other chemical forms of radioactivity do not exceed 5.0 percent of the total radioactivity. It may contain a suitable preservative. It contains not more than 1 mg of chromium (Cr) per mL.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, at a temperature between  $2^\circ$  and  $8^\circ$ .

**Labeling**—Label it to include the following, in addition to the information specified for *Labeling* under *Injections* (1): the time and date of calibration; the amount of  $^{51}\text{Cr}$  as edetate complex expressed as total MBq (or mCi) and as MBq (or mCi) per mL at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay and the quantity of chromium, and also indicates that the radioactive half-life of  $^{51}\text{Cr}$  is 27.8 days.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of

$^{51}\text{Cr}$  of known purity that exhibits a photopeak having an energy of 0.320 MeV.

**Bacterial endotoxins** (85): not more than 175/V USP Endotoxin Unit per mL of the Injection, in which V is the maximum recommended total dose, in mL, at the expiration date or time.

**pH** (791): between 3.5 and 6.5.

**Radiochemical purity—**

*Electrolyte solution*—Dissolve 0.2 g of barbital sodium and 10 g of sodium nitrate in water to make 1000 mL.

*Procedure* (see *Electrophoresis* (726))—Soak a 2.5-cm  $\times$  17.0-cm  $\times$  0.22-mm cellulose strip in 100 mL of *Electrolyte solution* for 10 to 60 minutes. Remove the strip with forceps, and blot to remove excess solution. Attach the strip to the support bridge of an electrophoresis chamber containing *Electrolyte solution*. Apply to the strip about 10  $\mu\text{L}$  of Injection as a 3-mm band at a position 10 cm from the cathode. Attach the chamber cover, and perform the electrophoresis at 30 V per cm, using a stabilized current. Remove the strip from the chamber, and blot the ends. Using a suitable scanner and counting assembly, determine the radioactivity distribution: chromium  $^{51}\text{Cr}$  edetate moves about 5 cm towards the anode; and  $^{51}\text{Cr}$  chromic ion moves about 7 cm towards the cathode. The radioactivity of the chromium  $^{51}\text{Cr}$  edetate band is not less than 95% of the total radioactivity.

**Radionuclidic purity**—Using a suitable gamma-ray spectrometer (see *Selection of a Counting Assembly* in the Assay section under *Radioactivity* (821)), determine the radioactivity of each radionuclidic impurity observed in the gamma-ray spectrum: not more than 0.1% of any individual impurity is found; and not more than 0.3% of total impurities is found.

**Chemical purity**—Using a validated limit test and a known analytical technique, demonstrate the absence of any ingredients and reagents employed in the synthetic process.

**Limit of free chromium—**

*Standard solution*—Dissolve 0.96 g of chromium potassium sulfate dodecahydrate and 2.87 g of edetate disodium in 50 mL of water, boil for 10 minutes, cool, adjust with 0.2 M sodium hydroxide to a pH between 3.5 and 6.5, and dilute with water to 100.0 mL to obtain a solution having a known concentration of about 1 mg of chromium per mL.

*Test solution*—Use the Injection.

*Procedure*—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* at the wavelength of maximum absorbance at about 560 nm, with a suitable spectrophotometer, using water as the blank: the absorbance of the *Test solution* is not more than that of the *Standard solution*.

**Other requirements**—It meets the requirements under *Injections* (1), except that it is not subject to the recommendation on *Container Content*.

**Assay for radioactivity** (821)—Using a suitable counting assembly (see *Selection of a Counting Assembly*), determine the radioactivity, in MBq (or  $\mu\text{Ci}$ ) per mL, of Injection by use of a calibrated system.

110.0 percent of the labeled potency, as determined by the Assay.

**Packaging and storage**—Preserve in tight containers, and avoid exposure to excessive heat.

**USP Reference standards** (11)—

USP Chymotrypsin RS

USP Trypsin Crystallized RS

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Pseudomonas aeruginosa* and *Salmonella* species and *Staphylococcus aureus*.

**Loss on drying** (731)—Dry it in a vacuum oven at 60° for 4 hours: it loses not more than 5.0% of its weight.

**Residue on ignition** (281): not more than 2.5%.

**Limit of trypsin—**

*Chymotrypsin solution*—Dissolve 100 mg in 10.0 mL of water.

*pH 8.1 Tris(hydroxymethyl)aminomethane buffer, 0.08 M*—Dissolve 294 mg of calcium chloride in 40 mL of 0.20 M tris(hydroxymethyl)aminomethane, adjust with 1 N hydrochloric acid to a pH of 8.1, and dilute with water to 100 mL.

*Substrate solution*—Transfer 98.5 mg of *p*-toluenesulfonyl-L-arginine methyl ester hydrochloride, suitable for use in assaying trypsin, to a 25-mL volumetric flask. Add 5 mL of *pH 8.1 Tris(hydroxymethyl)aminomethane buffer, 0.08 M*, and swirl until the substrate dissolves. Add 0.25 mL of methyl red-methylene blue TS, and dilute with water to volume.

*Procedure*—[NOTE—Determine the suitability of the substrate by performing the *Procedure* using the appropriate amount of USP Trypsin Crystallized RS in place of the test specimen.] By means of a micropipet, transfer 50  $\mu\text{L}$  of *Chymotrypsin solution* to a depression on a white spot plate. Add 0.2 mL of *Substrate solution*: no purple color develops within 3 minutes (not more than 1% of trypsin).

**Assay—**

*pH 7.0 phosphate buffer, fifteenth-molar*—Dissolve 4.54 g of monobasic potassium phosphate in water to make 500 mL of solution. Dissolve 4.73 g of anhydrous dibasic sodium phosphate in water to make 500 mL of solution. Mix 38.9 mL of the monobasic potassium phosphate solution with 61.1 mL of dibasic sodium phosphate solution. If necessary, adjust to a pH of 7.0 by the dropwise addition of dibasic sodium phosphate solution.

*Substrate solution*—Dissolve 23.7 mg of *N*-acetyl-L-tyrosine ethyl ester, suitable for use in assaying Chymotrypsin, in about 50 mL of *pH 7.0 phosphate buffer, fifteenth-molar*, with warming. When the solution is cool, dilute with additional pH 7.0 buffer to 100 mL. [NOTE—*Substrate solution* may be stored in the frozen state and used after thawing, but it is important to freeze it immediately after preparation.]

*Chymotrypsin solution*—Dissolve a sufficient quantity of Chymotrypsin, accurately weighed, in 0.0012 N hydrochloric acid to yield a solution containing between 12 and 16 USP Chymotrypsin Units per mL. The dilution is correct if, during the conduct of the assay, there is a change in absorbance of between 0.008 and 0.012 in each 30-second interval.

*Procedure*—[NOTE—Determine the suitability of the substrate and check the adjustment of the spectrophotometer by performing the *Procedure* using USP Chymotrypsin RS in place of the assay specimen.] Conduct the assay in a suitable spectrophotometer equipped to maintain a temperature of  $25 \pm 0.1^\circ$  in the cell compartment. Determine the temperature in the reaction cell before and after the measurement of absorbance in order to ensure that the temperature does not change by more than  $0.5^\circ$ . Pipet 0.2 mL of 0.0012 N hydrochloric acid and 3.0 mL of *Substrate solution* into a 1-cm cell. Place this cell in the spectrophotometer, and ad-

## Chymotrypsin

Chymotrypsin.

Chymotrypsin [9004-07-3].

» Chymotrypsin is a proteolytic enzyme crystallized from an extract of the pancreas gland of the ox, *Bos taurus* Linné (Fam. Bovidae). It contains not less than 1000 USP Chymotrypsin Units in each mg, calculated on the dried basis, and not less than 90.0 percent and not more than

just the instrument so that the absorbance will read 0.200 at 237 nm. Pipet 0.2 mL of *Chymotrypsin solution* into another 1-cm cell, add 3 mL of *Substrate solution*, and place the cell in the spectrophotometer. [NOTE—Carefully follow this order of addition, and begin timing the reaction from the addition of the *Substrate solution*.] Read the absorbance at 30-second intervals for not less than 5 minutes. Repeat the procedure on the same dilution at least once. Absolute absorbance values are less important than a constant rate of absorbance change. If the rate of change fails to remain constant for not less than 3 minutes, repeat the test and, if necessary, use a lower concentration. The duplicate determination at the same dilution matches the first determination in rate of absorbance change. Determine the average absorbance change per minute, using only the values within the 3-minute portion of the curve where the rate of absorbance change is constant. Plot a curve of absorbance against time. One USP Chymotrypsin Unit is the activity causing a change in absorbance of 0.0075 per minute under the conditions specified in this assay. Calculate the number of USP Chymotrypsin Units per mg taken by the formula:

$$(A_2 - A_1) / (0.0075TW)$$

in which  $A_2$  is the absorbance straight-line initial reading,  $A_1$  is the absorbance straight-line final reading,  $T$  is the elapsed time, in minutes, between the initial and final readings, and  $W$  is the weight, in mg, of Chymotrypsin in the volume of solution used in determining the absorbance.

### Chymotrypsin for Ophthalmic Solution

» Chymotrypsin for Ophthalmic Solution is sterile Chymotrypsin. When constituted as directed in the labeling, it yields a solution containing not less than 80.0 percent and not more than 120.0 percent of the labeled potency.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, and avoid exposure to excessive heat.

**Completeness of solution** (641)—It dissolves in the solvent and in the concentration recommended in the labeling to yield a clear solution.

**Identification**—Prepare a *Substrate solution* as follows. Transfer 237.0 mg of *N*-acetyl-L-tyrosine ethyl ester, suitable for use in assaying chymotrypsin, to a 100-mL volumetric flask, add 2 mL of alcohol, and swirl until solution is effected. Add 20 mL of *pH 7.0 phosphate buffer, fifteenth-molar*, prepared as directed in the *Assay* under *Chymotrypsin*, add 1 mL of methyl red–methylene blue TS, and dilute with water to volume. If necessary, adjust to a pH of 7.0 by the dropwise addition of monobasic potassium phosphate solution, prepared by dissolving 4.54 g of monobasic potassium phosphate in sufficient water to yield 500 mL of solution. Dissolve the contents of 1 vial of Chymotrypsin for Ophthalmic Solution in 1 mL of saline TS, transfer 0.2 mL to a suitable dish, and add 0.2 mL of *Substrate solution*: a purple color is produced within 3 minutes. [NOTE—distinction from trypsin, which produces no purple color within 3 minutes.]

**Uniformity of dosage units** (905): meets the requirements.

*Procedure for content uniformity*—Assay 10 individual units as directed in the *Assay*, and calculate the average of the 10 results. The average is not less than 80.0% and not more than 120.0% of the labeled amount. The contents of not more than 2 vials deviate by more than 10% from the average content. The contents of none of the vials deviate by more than 15% from the average.

**pH** (791): between 4.3 and 8.7, in the solution constituted as directed in the labeling.

**Other requirements**—It meets the requirements of the test for *Limit of trypsin* under *Chymotrypsin*. It also meets the requirements for *Sterility Tests* (71).

**Assay**—Proceed with Chymotrypsin for Ophthalmic Solution as directed in the *Assay* under *Chymotrypsin*, but use the following as the *Chymotrypsin solution*: dissolve the contents of 1 vial of Chymotrypsin for Ophthalmic Solution in 5.0 mL of 0.0012 N hydrochloric acid. Dilute an accurately measured volume ( $V$ , in mL) of this solution, equivalent to about 300 USP Chymotrypsin Units, with 0.0012 N hydrochloric acid to 25.0 mL. Calculate the number of USP Chymotrypsin Units per vial taken by the formula:

$$300(5 / V)(A_2 - A_1) / [T(2.4)(0.0075)]$$

in which  $A_2$  is the absorbance straight-line initial reading,  $A_1$  is the absorbance straight-line final reading,  $T$  is the elapsed time in minutes between the initial and final readings, and 2.4 is the number of USP Chymotrypsin Units in the solution on which the absorbance was determined.

### Ciclopirox

$C_{12}H_{17}NO_2$  207.27  
2(1*H*)-Pyridinone, 6-cyclohexyl-1-hydroxy-4-methyl-  
6-Cyclohexyl-1-hydroxy-4-methyl-2(1*H*)-pyridone  
[29342-05-0].

» Ciclopirox contains not less than 98.0 percent and not more than 101.0 percent of  $C_{12}H_{17}NO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, protected from light. Store at a temperature between 15° and 30°.

**USP Reference standards** (11)—

USP Ciclopirox RS

USP Ciclopirox Related Compound A RS

3-Cyclohexyl-4,5-dihydro-5-methyl-5-isoxazolyl acetic acid.

USP Ciclopirox Related Compound B RS

6-Cyclohexyl-4-methyl-2-pyrone.

**Identification, Infrared Absorption** (197K).

**Loss on drying** (731)—Dry it in vacuum to constant weight: it loses not more than 1.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 0.001%.

**Related compounds**—[NOTE—Carry out the operations avoiding exposure to actinic light. All materials in direct connection with Ciclopirox, like column materials, reagents, solvents, and others should contain only very low amounts of extractable metal cations.]

*Mobile phase*—Prepare a filtered and degassed mixture of an edetate disodium solution (0.96 in 1000), acetonitrile, and glacial acetic acid (770:230:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Rinsing solution*—Prepare a mixture of water, acetonitrile, glacial acetic acid, and acetylacetone (500 : 500 : 1:1).

**Standard stock solution**—Dissolve USP Ciclopirox Related Compound A RS and USP Ciclopirox Related Compound B RS, accurately weighed, in an appropriate volume of acetonitrile and *Mobile phase* solution (approximate ratio, 1:7). Further dilute with *Mobile phase* to obtain a solution having a known final concentration of about 1.5 mg each per mL.

**Standard solution A**—Dilute 1.0 mL of *Standard stock solution* to 200.0 mL with a mixture of *Mobile phase* and acetonitrile (9:1).

**Standard solution B**—Dilute 2.0 mL of *Standard solution A* to 10.0 mL with a mixture of *Mobile phase* and acetonitrile (9:1).

**Test solution**—Dissolve 30 mg of Ciclopirox, accurately weighed, in a mixture of 2 mL of acetonitrile and 15 mL of *Mobile phase*. If necessary, use an ultrasonic bath. Dilute with *Mobile phase* to 20.0 mL.

**Resolution solution**—Mix 5 mL of *Standard stock solution* with 5 mL of the *Test solution*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 298 nm and a 4.0-mm × 8-cm column that contains packing L10. [NOTE—Ciclopirox related compound A has an intense absorbance at 220 nm, and 6-cyclohexyl-4-methyl-2(1H)-pyridone, ciclopirox related compound B, and ciclopirox have intense absorbances at 298 nm.] The flow rate is about 0.7 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure* at 298 nm: the resolution, *R*, between the ciclopirox related compound B peak and ciclopirox peak is not less than 2.0. Chromatograph the *Standard solution B*, and record the peak responses as directed for *Procedure* at 298 nm: the chromatogram obtained shows at 298 nm a peak corresponding to ciclopirox related compound B with a signal-to-noise ratio of not less than 3. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure* at 298 nm: the tailing factor for the ciclopirox peak is less than 2.0.

**Procedure**—Separately inject equal volumes (about 10 µL) of *Standard solution A*, *Standard solution B*, and the *Test solution* into the chromatograph, and record the chromatograms. [NOTE—In order to ensure desorption of disruptive metal ions, every new column must be rinsed with the *Rinsing solution* over a period of not less than 15 hours and then with the *Mobile phase* for not less than 5 hours with a flow rate of 0.2 mL per minute. The chromatographic run time is not less than 2.5 times the retention time of the ciclopirox peak.] The relative retention times are about 0.5 for ciclopirox related compound A, 0.9 for 6-cyclohexyl-4-methyl-2(1H)-pyridone, 1.0 for ciclopirox, and 1.3 for ciclopirox related compound B. The peak response at 220 nm of the ciclopirox related compound A peak in the chromatogram obtained from the *Test solution* is not more than the peak response at 220 nm of the corresponding peak in the chromatogram obtained from *Standard solution A* (0.5%). The sum of responses at 298 nm of the peaks in the chromatogram obtained from the *Test solution* is not more than the peak response at 298 nm of the ciclopirox related compound B peak in the chromatogram obtained from *Standard solution A* (0.5%). At 298 nm disregard any peak due to the solvent and any peak with a response less than the response of the ciclopirox related compound B peak in the chromatogram obtained from *Standard solution B* at 298 nm (0.1%).

**Assay**—Dissolve 150 mg of Ciclopirox, accurately weighed, in 20 mL of methanol. Add 20 mL of water, mix, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Carry out a blank test. Determine the factor of the 0.1 N sodium hydroxide VS using 100 mg of benzoic acid, accurately weighed, and titrate under the conditions prescribed above. Each mL of 0.1 N sodium hydroxide is equivalent to 20.73 mg of C<sub>12</sub>H<sub>17</sub>NO<sub>2</sub>.

## Ciclopirox Topical Solution

### DEFINITION

Ciclopirox Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of ciclopirox (C<sub>12</sub>H<sub>17</sub>NO<sub>2</sub>).

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Protect the *Standard solution* and *Sample solution* from light.]

**Buffer:** Transfer 5.25 g of citric acid and 25 mL of 0.1 M edetate disodium to a 1-L volumetric flask, and dilute with water to volume. Adjust with 8.5% diluted sodium hydroxide solution to a pH of 6.5.

**Mobile phase:** Acetonitrile and *Buffer* (35:65)

**Standard solution:** 0.2 mg/mL of USP Ciclopirox RS and 1 µg/mL each of USP Ciclopirox Related Compound B RS and USP Ciclopirox Related Compound C RS in methanol

**Sample solution:** Equivalent to 0.2 mg/mL of ciclopirox in methanol from Topical Solution. Pass through a filter of 0.45-µm pore size, and use the filtrate.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 303 nm

**Column:** 4-mm × 12.5-cm; 5-µm packing L1

**Column temperature:** 30 ± 5°

**Flow rate:** 0.9 mL/min

**Run time:** 5 times the retention time of the major peak

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—For information only, see *Table 1* for relative retention times of impurities.]

#### Suitability requirements

**Resolution:** NLT 3.0 between ciclopirox and ciclopirox related compound B; and NLT 3.0 between ciclopirox related compound C and ciclopirox

**Tailing factor:** NMT 2.0 for the ciclopirox peak

**Relative standard deviation:** NMT 2.0% for the ciclopirox peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of ciclopirox (C<sub>12</sub>H<sub>17</sub>NO<sub>2</sub>) in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Ciclopirox RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of ciclopirox in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- MINIMUM FILL <755>:** Meets the requirement

### IMPURITIES

#### ORGANIC IMPURITIES

**Buffer, Mobile phase, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Analysis****Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Topical Solution taken:

$$\text{Result} = (r_U/r_T) \times (1/F) \times 100$$

 $r_U$  = peak response of each individual impurity from the *Sample solution* $r_T$  = sum of responses of all the peaks in the *Sample solution* $F$  = relative response factor (see *Table 1*)**Acceptance criteria:** See *Table 1*.**Table 1**

Compound	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Ciclopirox related compound C	0.54	1.3	0.5
Ciclopirox	1.0	—	—
Ciclopirox related compound B <sup>a</sup>	1.87	—	—
Any unspecified individual impurity	—	1.0	0.2
Total impurities	—	—	1.2

<sup>a</sup> Process impurity already monitored in the drug substance.**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): The total aerobic microbial count does not exceed  $10^2$  cfu/g, and the total combined molds and yeasts count does not exceed  $10^1$  cfu/g.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at controlled room temperature.
- **USP REFERENCE STANDARDS** (11)
  - USP Ciclopirox RS
  - USP Ciclopirox Related Compound B RS  
6-Cyclohexyl-4-methyl-2-pyrone.  
 $C_{12}H_{16}O_2$  192.25
  - USP Ciclopirox Related Compound C RS  
6-Cyclohexyl-4-methylpyridin-2(1*H*)-one.  
 $C_{12}H_{17}NO$  191.27

**Ciclopirox Olamine** $C_{12}H_{17}NO_2 \cdot C_2H_7NO$  268.352(1*H*)-Pyridinone, 6-cyclohexyl-1-hydroxy-4-methyl-, compound with 2-aminoethanol (1:1).6-Cyclohexyl-1-hydroxy-4-methyl-2(1*H*)-pyridone compound with 2-aminoethanol (1:1) [41621-49-2].

» Ciclopirox Olamine contains not less than 97.5 percent and not more than 101.5 percent of ciclopirox olamine ( $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ ).

**Packaging and storage**—Preserve in tight containers, protected from light. Store between 5° and 25°.

**USP Reference standards** (11)—

USP Ciclopirox Olamine RS

USP Ciclopirox Related Compound A RS

3-Cyclohexyl-4,5-dihydro-5-methyl-5-isoxazolyl acetic acid.

USP Ciclopirox Related Compound B RS

6-Cyclohexyl-4-methyl-2-pyrone.

**Identification,** *Infrared Absorption* (197K).**pH** (791): between 8.0 and 9.0, in a mixture with water (1:100).**Residue on ignition** (281): not more than 0.1%.**Heavy metals,** *Method II* (231): not more than 0.001%.

**Monoethanolamine content**—Dissolve about 300 mg, accurately weighed, in 25 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 6.108 mg of  $C_2H_7NO$ . The content of monoethanolamine ( $C_2H_7NO$ ) is not less than 223 mg and not more than 230 mg per g of ciclopirox olamine ( $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ ) found in the Assay.

**Related compounds**—[NOTE—Carry out the operations avoiding exposure to actinic light. All materials that are in direct contact with Ciclopirox Olamine (e.g., column materials, reagents, solvents, etc.) should contain only very low amounts of extractable metal cations.]

**Mobile phase**—Prepare a filtered and degassed mixture of an edetate disodium solution (0.96 in 1000), acetonitrile, and glacial acetic acid (770:230:0.1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Rinsing solution**—Prepare a mixture of water, acetonitrile, glacial acetic acid, and acetylacetone (500:500:1:1).

**Standard stock solution**—Dissolve USP Ciclopirox Related Compound A RS and USP Ciclopirox Related Compound B RS, accurately weighed, in an appropriate volume of acetonitrile and *Mobile phase* solution (approximate ratio, 1:7). Further dilute with *Mobile phase* to obtain a solution having a known final concentration of about 1.5 mg of each per mL.

**Standard solution A**—Dilute 1.0 mL of *Standard stock solution* to 200.0 mL with a mixture of *Mobile phase* and acetonitrile (9:1).

**Standard solution B**—Dilute 2.0 mL of *Standard solution A* to 10.0 mL with a mixture of *Mobile phase* and acetonitrile (9:1).

**Test solution**—Dissolve 40 mg of Ciclopirox Olamine, accurately weighed, in a mixture of 2 mL of acetonitrile, 20  $\mu$ L of glacial acetic acid, and 15 mL of *Mobile phase*. If necessary, use an ultrasonic bath to dissolve. Dilute with *Mobile phase* to 20.0 mL, and mix.

**Resolution solution**—Mix 5 mL of *Standard stock solution* with 5 mL of the *Test solution*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a detector capable of recording at both 220 nm and 298 nm and a 4.0-mm  $\times$  8-cm column that contains packing L10. [NOTE—Ciclopirox related compound A has an intense absorbance at 220 nm, and 6-cyclohexyl-4-methyl-2(1*H*)-pyridone, ciclopirox related compound B, and ciclopirox have intense absorbances at 298 nm.] The flow rate is about 0.7 mL per minute. Chromatograph the *Resolution solution* at 298 nm, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the ciclopirox related compound B peak and the ciclopirox peak is not less than 2.0. Chromatograph *Standard solution B* at 298 nm, and record the peak responses as directed for *Procedure*: the chromatogram obtained shows at 298 nm a peak corresponding to ciclopirox related compound B with a signal-to-noise ratio of not less than 3. Chromatograph the *Test solution* at 298 nm, and record the peak responses as directed for *Procedure*: the tailing factor for the ciclopirox peak is less than 2.0.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of *Standard solution A*, *Standard solution B*, and the *Test solution* into the chromatograph, and record the chromatograms. [NOTE—In order to ensure desorption of disruptive metal ions, every new column must be rinsed with the *Rinsing solution* over a period of not less than 15 hours and then with *Mobile phase* for not less than 5 hours with a flow rate of 0.2 mL per minute. The chromatographic run time is not less than 2.5 times the retention time of the ciclopirox peak.] The relative retention times are about 0.5 for ciclopirox related compound A, 0.9 for 6-cyclohexyl-4-methyl-2(1*H*)-pyridone, 1.0 for ciclopirox, and 1.3 for ciclopirox related compound B. The peak response at 220 nm of the ciclopirox related compound A peak in the chromatogram obtained from the *Test solution* is not more than the peak response at 220 nm of the corresponding peak in the chromatogram obtained from *Standard solution A* (0.5% with reference to ciclopirox). The sum of responses at 298 nm of the impurity peaks in the chromatogram obtained from the *Test solution* is not more than the peak response at 298 nm of the ciclopirox related compound B peak in the chromatogram obtained from *Standard solution A* (0.5% with reference to ciclopirox). At 298 nm disregard any peak due to the solvent and any peak with a response less than the response of the ciclopirox related compound B peak in the chromatogram obtained from *Standard solution B* at 298 nm (0.1% with reference to ciclopirox).

**Assay**—Dissolve 200 mg of Ciclopirox Olamine, accurately weighed, in 2 mL of methanol. Add 38 mL of water, mix, and titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary corrections. Determine the factor of the 0.1 N sodium hydroxide VS using 100 mg of benzoic acid, accurately weighed, and titrate under the conditions prescribed above. Each mL of 0.1 N sodium hydroxide is equivalent to 26.84 mg of ciclopirox olamine ( $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ ).

## Ciclopirox Olamine Cream

» Ciclopirox Olamine Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ciclopirox olamine ( $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ ).

**Packaging and storage**—Preserve in collapsible tubes, and store at controlled room temperature.

### USP Reference standards (11)—

USP Benzyl Alcohol RS

USP Ciclopirox Olamine RS

**Identification**—Dilute 4 mL of the *Assay preparation* obtained as directed in the *Assay* with a mixture of methanol and 6.25 N sodium hydroxide (123:2) to make 100 mL: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution prepared from the *Standard preparation* obtained as directed in the *Assay*, concomitantly measured.

**Minimum fill** (755): meets the requirements.

**pH** (791)—Add 15 mL of boiling water, previously adjusted with 0.1 N hydrochloric acid or 0.1 N sodium hydroxide to a pH of 6 to 7, to 3.5 g of Cream in a 50-mL centrifuge tube. Place a cap on the tube, and shake vigorously until an emulsion is formed. Loosen the cap, and heat the tube on a steam bath for 10 minutes. Allow to cool, centrifuge, and determine the pH of the aqueous phase: the pH is between 5.0 and 8.0.

### Content of benzyl alcohol (if present)—

**Solvent mixture**—Mix chloroform and methanol (4:1).

**Internal standard solution**—Prepare a solution of 1-nonyl alcohol in *Solvent mixture* containing about 1.75 mg per mL.

**Standard preparation**—Dilute an accurately weighed quantity of USP Benzyl Alcohol RS, quantitatively and stepwise, with *Solvent mixture* to obtain a solution having a known concentration of about 2 mg per mL. Transfer 5.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 50-mL volumetric flask, dilute with *Solvent mixture* to volume, and mix.

**Test preparation**—Transfer 1.0 g of Cream to a 50-mL volumetric flask, add about 30 mL of *Solvent mixture*, and mix. Add 5.0 mL of *Internal standard solution*, dilute with *Solvent mixture* to volume, and mix to obtain a clear solution.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and contains a 4-mm  $\times$  2-m glass column packed with 3% phase G3 on 100- to 120-mesh support S1AB. The column is maintained at a temperature of about 100°, the injection port and detector temperatures are maintained at about 315°, and nitrogen is used as the carrier gas at a flow rate of about 45 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the peaks is not less than 1.6; the tailing factor for the benzyl alcohol peak and the internal standard peak is not greater than 3.5; and the relative standard deviation for replicate injections is not more than 3%.

**Procedure**—Separately inject equal volumes (about 2  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. [NOTE—After six injections, raise the column temperature to about 300° for about 5 minutes, then cool to 100°.] Calculate the percentage of benzyl alcohol in the Cream taken by the formula:

$$C(R_U / R_S),$$

in which  $C$  is the concentration, in mg per mL, of benzyl alcohol in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the benzyl alcohol peak to the internal standard peak obtained from the *Test preparation* and the *Standard preparation*, respectively: between 90.0% and 110.0% of the claimed amount is present.

### Assay—

**Ferrous sulfate solution**—Transfer 600 mg of ferrous sulfate to a 25-mL volumetric flask. Add 0.6 mL of glacial acetic acid, dilute with water to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Ciclopirox Olamine RS in methanol to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 10 mg of ciclopirox olamine, to a 50-mL volumetric flask, add 25 mL of methanol, and shake by mechanical means for about 10 minutes. Dilute with methanol to volume, mix, centrifuge, and use the supernatant.

**Procedure**—Transfer 4.0 mL of the *Standard preparation*, 4.0 mL of the *Assay preparation*, and 4.0 mL of methanol to provide a blank, to separate 25-mL volumetric flasks. Add 15 mL of methanol to each flask, and mix. Then to each flask add 1.0 mL of *Ferrous sulfate solution*, mix, dilute with methanol to volume, and mix. Store the flasks in the dark for 1 hour. Concomitantly determine the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* against the blank in 1-cm cells at the wavelength of maximum absorbance at about 440 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of

ciclopirox olamine ( $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ ) in each g of the Cream taken by the formula:

$$50(C/W)(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Ciclopirox Olamine RS in the *Standard preparation*; W is the weight, in g, of Cream taken; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Ciclopirox Olamine Topical Suspension

» Ciclopirox Olamine Topical Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ciclopirox olamine ( $C_{12}H_{17}NO_2 \cdot C_2H_7NO$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Benzyl Alcohol RS

USP Ciclopirox Olamine RS

**Identification**—It responds to the *Identification* test under *Ciclopirox Olamine Cream*.

**Minimum fill** (755): meets the requirements.

**pH** (791)—Proceed as directed for pH under *Ciclopirox Olamine Cream*, except to read "Topical Suspension" in place of "Cream" throughout.

**Content of benzyl alcohol**—Proceed as directed for *Content of benzyl alcohol* under *Ciclopirox Olamine Cream*, except to read "Topical Suspension" in place of "Cream" throughout.

**Assay**—Proceed as directed in the *Assay* under *Ciclopirox Olamine Cream*, except to read "Topical Suspension" in place of "Cream" throughout.

## Cilastatin Sodium

$C_{16}H_{25}N_2NaO_5S$  380.43

2-Heptenoic acid, 7-[(2-amino-2-carboxyethyl)thio]-2-[[[(2,2-dimethylcyclopropyl)carbonyl]amino]-, monosodium salt, [R-[R\*,S\*-(Z)]]-

Sodium (Z)-7-[[[(R)-2-amino-2-carboxyethyl]thio]-2-[(S)-2,2-dimethylcyclopropanecarboxamido]-2-heptenoate [81129-83-1].

» Cilastatin Sodium contains not less than 98.0 percent and not more than 101.5 percent of  $C_{16}H_{25}N_2NaO_5S$ , calculated on the anhydrous and solvent-free basis.

**Packaging and storage**—Preserve in *Containers for Sterile Solutions* as described under *Injections* (1), and store in a cold place.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile.

**USP Reference standards** (11)—

USP Cilastatin Ammonium Salt RS

USP Endotoxin RS

**Identification**—

**A:** The retention time of the major peak for cilastatin in the chromatogram of the *Test solution*, as obtained in the test for *Chromatographic purity*, corresponds to that in the chromatogram of a similar preparation of USP Cilastatin Ammonium Salt RS.

**B:** Ignite a small portion of it on a platinum wire in a nonluminous flame: an intense yellow color is imparted to the flame.

**Specific rotation** (781S): between +41.5° and +44.5°, on the anhydrous and solvent-free basis.

*Test solution:* 10 mg per mL, in a mixture of methanol and hydrochloric acid (120:1).

**Bacterial endotoxins** (85)—Where the label states that Cilastatin Sodium is sterile, it contains not more than 0.17 USP Endotoxin Unit per mg of cilastatin.

**Sterility** (71)—Where the label states that Cilastatin Sodium is sterile, it meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*, 6 g of specimen dissolved in 200 mL of *Fluid A* being used.

**pH** (791): between 6.5 and 7.5, in a solution (1 in 100).

**Water**, *Method I* (921): not more than 2.0%.

**Heavy metals**, *Method II* (231): 0.002%.

**Limit of solvents**—

*Internal standard solution*—Transfer 0.5 mL of *n*-propyl alcohol to a 1000-mL volumetric flask, dilute with water to volume, and mix.

*Standard solution*—Transfer 2.0 mL of acetone, 0.50 mL of methanol, and 0.50 mL of mesityl oxide to a 1000-mL volumetric flask, dilute with water to volume, and mix. Transfer 2.0 mL of this solution and 2.0 mL of *Internal standard solution* to a 10-mL volumetric flask, dilute with water to volume, and mix. This solution contains 316 µg of acetone, 79 µg of methanol, and 86 µg of mesityl oxide per mL.

*Test solution*—Transfer about 200 mg of Cilastatin Sodium, accurately weighed, to a 10-mL volumetric flask, add 2.0 mL of *Internal standard solution* and about 5 mL of water, and dissolve by shaking. Dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 0.53-mm × 30-m capillary column, the internal wall of which is coated with a 1.0-µm film of liquid phase G16. The column temperature is maintained at 50° for 2.5 minutes, then increased at a rate of 8° per minute to 70°, and maintained at 70° for 0.5 minute; the injection port temperature is maintained at 160°; the detector temperature is maintained at 250°; and helium is used as the carrier gas at a flow rate of about 9 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.26 for acetone, 0.35 for methanol, 0.67 for *n*-propyl alcohol, and 1.0 for mesityl oxide; and the relative standard deviation for replicate injections, determined from peak area ratios of each analyte to *n*-propyl alcohol, is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 1 µL) of the *Standard solution* and the *Test solution* into the chromatograph, using the solvent (water) flush technique; record the chromatograms; and measure the areas for the acetone, methanol, *n*-propyl alcohol, and mesityl oxide peaks. Calculate the percentages of acetone, methanol, and mesityl

oxide in the portion of Cilastatin Sodium taken by the formula:

$$(C/W)(R_U / R_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of the appropriate analyte in the *Standard solution*;  $W$  is the quantity, in mg, of Cilastatin Sodium taken to prepare the *Test solution*; and  $R_U$  and  $R_S$  are the peak area ratios of the corresponding analyte to *n*-propyl alcohol obtained from the *Test solution* and the *Standard solution*, respectively. Not more than 1.0% of acetone is found; not more than 0.5% of methanol is found; and not more than 0.4% of mesityl oxide is found.

#### Chromatographic purity—

**Solvent**—Use water.

**Solution A**—Prepare a mixture of dilute phosphoric acid (1 in 1000) and acetonitrile (700:300), pass through a filter having a 0.5- $\mu\text{m}$  or finer porosity, and degas.

**Solution B**—Use dilute phosphoric acid (1 in 1000). Pass through a filter having a 0.5- $\mu\text{m}$  or finer porosity, and degas.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Test solution**—Prepare a solution of Cilastatin Sodium in *Solvent* having a concentration of about 1.6 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 210-nm detector and a 4.5-mm  $\times$  25-cm column containing packing L1. The column is maintained at a constant temperature of about 50°. The flow rate is about 2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	15	85	equilibration
0–30	15→100	85→0	linear gradient

Chromatograph the *Test solution*, and measure the peak responses as directed for *Procedure*: the capacity factor,  $K'$ , is not less than 10; the column efficiency determined from the cilastatin peak is not less than 3000 theoretical plates; and the tailing factor is not more than 4.5.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Test solution* and the *Solvent* into the chromatograph, record the chromatograms, and measure the areas of the peaks. Calculate the chromatographic purity, in percentage, of the portion of Cilastatin Sodium taken by the formula:

$$100r_C / (r_T - r_B - r_A)$$

in which  $r_C$  is the area of the cilastatin peak obtained from the *Test solution*;  $r_T$  is the sum of the areas of all the peaks obtained from the *Test solution*;  $r_B$  is the sum of the areas of all the peaks obtained from the *Solvent*; and  $r_A$  is the response of the peak, if any, of nonretained substances, such as acetone, at the solvent front obtained from the *Test solution*: not less than 98.5% is found. Calculate the percentage of each impurity in the portion of Cilastatin Sodium taken by the formula:

$$100r_i / (r_T - r_B - r_A)$$

in which  $r_i$  is the peak area for each impurity in the chromatogram obtained from the *Test solution* and the other terms are as defined above: not more than 0.5% of any individual impurity is found.

**Assay**—Transfer about 300 mg of Cilastatin Sodium, accurately weighed, to a suitable beaker, add 30 mL of methanol, and dissolve by swirling. Add 5 mL of water, and titrate potentiometrically with 0.1 N hydrochloric acid to a pH of

about 3. Then titrate with 0.1 N sodium hydroxide until three inflection points have been observed. Calculate the titer difference, in mL, between the first and third inflection points. Each mL of 0.1 N sodium hydroxide is equivalent to 19.022 mg of  $\text{C}_{16}\text{H}_{25}\text{N}_2\text{NaO}_5\text{S}$ .

## Cilostazol

$\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$  369.46

2(1*H*)-Quinolinone, 6-[4-(1-cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-3,4-dihydro-

6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-3,4-dihydro-carbostyryl [73963-72-1].

» Cilostazol contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{20}\text{H}_{27}\text{N}_5\text{O}_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store at room temperature.

#### USP Reference standards <11>—

USP Cilostazol RS

USP Cilostazol Related Compound A RS

6-Hydroxy-3,4-dihydro-1*H*-quinolin-2-one.

$\text{C}_9\text{H}_9\text{NO}_2$  163.17

USP Cilostazol Related Compound B RS

6-[4-(1-Cyclohexyl-1*H*-tetrazol-5-yl)butoxy]-1*H*-quinolin-2-one.

$\text{C}_{20}\text{H}_{25}\text{N}_5\text{O}_2$  367.45

USP Cilostazol Related Compound C RS

1-(4-(5-Cyclohexyl-1*H*-tetrazol-1-yl)butyl)-

6-(4-(1-cyclohexyl-1*H*-tetrazol-5-yl)butoxy)-3,4-dihydroquinolin-2(1*H*)-one.

$\text{C}_{31}\text{H}_{43}\text{N}_9\text{O}_3$  589.73

#### Identification—

**A: Infrared Absorption** <197K>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** <731>—Dry it at 110° for 3 hours: it loses not more than 0.3% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

#### Chloride <221>—

**Test solution**—Dissolve 0.5 g of Cilostazol in 40 mL of dimethylformamide, add 6 mL of diluted nitric acid and dimethylformamide to make 50 mL.

**Control solution**—To 0.25 mL of 0.01 M hydrochloric acid add 6 mL of diluted nitric acid and dimethylformamide to make 50 mL.

**Procedure**—Add 1 mL of silver nitrate TS to the *Test solution* and to the *Control solution*, mix well, and allow to stand for 5 minutes, protecting from direct sunlight. Compare the opalescence developed in both solutions against a black background by viewing downward or transversely. The opalescence developed in the *Test solution* is not more than that of the *Control solution* (0.018%).

**Heavy metals, Method II** <231>: 0.001%.

#### Related compounds—

*Diluent, Solution A, Solution B, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve accurately weighed quantities of USP Cilostazol RS and USP Cilostazol Related Compound C RS in acetonitrile, with sonication if necessary, to obtain a solution having known concentrations of about 0.5 mg per mL of each component. Transfer 4 mL of this solution to a 10-mL volumetric flask, and dilute with water to volume. Further dilute this solution, stepwise if necessary, with *Diluent* to obtain a solution having known concentrations of about 0.4 µg per mL of each component.

**Test solution**—Transfer about 20 mg of Cilostazol, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL of acetonitrile, with sonication if necessary. Dilute with water to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of cilostazol related compound C by the formula:

$$0.1(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in µg per mL, of cilostazol related compound C in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Cilostazol in the *Test solution*;  $r_U$  is the peak response for cilostazol related compound C obtained from the *Test solution*; and  $r_S$  is the peak response for cilostazol related compound C obtained from the *Standard solution*. Calculate the percentage of other impurities by the formula:

$$0.1(1/F)(C_S / C_T)(r_U / r_S)$$

in which  $F$  is the relative response factor from Table 1;  $C_S$  is the concentration, in µg per mL, of cilostazol in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of cilostazol in the *Test solution*;  $r_U$  is the peak response for any other impurity obtained from the *Test solution*; and  $r_S$  is the peak response for cilostazol obtained from the *Standard solution*.

Table 1

Name	Relative Retention Time	Relative Response Factor ( $F$ )	Limit (%)
Cilostazol related compound A <sup>1</sup>	0.2	1.7	0.1
Cilostazol related compound B <sup>2</sup>	0.9	0.58	0.1
Cilostazol	1.0	1.0	—
Cilostazol related compound C <sup>3</sup>	1.9	—	0.1
Any other individual impurity	—	1.0	0.1

<sup>1</sup> 6-Hydroxy-3,4-dihydro-1H-quinolin-2-one

<sup>2</sup> 6-[4-(1-Cyclohexyl-1H-tetrazol-5-yl)butoxy]-1H-quinolin-2-one

<sup>3</sup> 1-(4-(5-Cyclohexyl-1H-tetrazol-1-yl)butyl)-6-(4-(1-cyclohexyl-1H-tetrazol-5-yl)butoxy)-3,4-dihydroquinolin-2(1H)-one

In addition to not exceeding the limits for impurities in Table 1, not more than 0.4% of total impurities is found.

#### Assay—

**Diluent**—Use a mixture of water and acetonitrile (60:40).

**Solution A**—Use a mixture of water and acetonitrile (70:30).

**Solution B**—Use a mixture of water and acetonitrile (50:50).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Prepare a solution in *Diluent* having known concentrations of about 0.05 mg per mL each of USP Cilostazol RS, USP Cilostazol Related Compound A RS, and USP Cilostazol Related Compound B RS.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cilostazol RS in acetonitrile, with sonication if necessary, to obtain a solution having a known concentration of about 1.0 mg per mL. Transfer 4 mL of this solution to a 10-mL volumetric flask, and dilute with water to volume. Further dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.04 mg per mL.

**Assay preparation**—Transfer about 20 mg of Cilostazol, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL of acetonitrile, sonicate if necessary, dilute with water to volume, and mix. Transfer 1 mL of this solution to a 10-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains 3.5-µm packing L7. The flow rate is about 1.0 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–6.5	100→50	0→50	linear gradient
6.5–10	50→0	50→100	linear gradient
10–20	0	100	isocratic
20–20.1	0→100	100→0	linear gradient
20.1–28	100	0	re-equilibration

Chromatograph the *System suitability solution*, identify the components using Table 1, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between cilostazol related compound B and cilostazol is not less than 3.0; the tailing factor for the cilostazol peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{20}H_{27}N_5O_2$  in the portion of Cilostazol taken by the formula:

$$500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of cilostazol in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cilostazol Tablets

### DEFINITION

Cilostazol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of cilostazol ( $C_{20}H_{27}N_5O_2$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197S)

**Standard solution:** 100 mg/mL of USP Cilostazol RS in chloroform

**Sample solution:** Transfer the equivalent of 100 mg of cilostazol from finely powdered Tablets into a glass container. Add 1 mL of chloroform, shake for 1 min, and pass through a suitable filter of 0.5-µm or finer pore size.

- **B.** The retention time of the cilostazol peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Acetonitrile, methanol, and water (7:3:10)

**Internal standard solution:** 4 mg/mL of benzophenone in methanol

**Standard solution:** 0.1 mg/mL of USP Cilostazol RS and 0.04 mg/mL of *Internal standard solution* in methanol

**Sample solution:** Transfer the equivalent of 50 mg of cilostazol from powdered Tablets (NLT 20) into a suitable volumetric flask and add an appropriate quantity of *Internal standard solution*. Dilute with methanol to obtain a solution of 0.1 mg/mL of USP Cilostazol RS and 0.04 mg/mL of the internal standard. Pass a portion of this solution through a membrane filter of 0.5-μm or finer pore size, and use the filtrate.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 9.0 between the cilostazol and benzophenone peaks, eluted in this order

**Relative standard deviation:** NMT 1.5%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cilostazol (C<sub>20</sub>H<sub>27</sub>N<sub>5</sub>O<sub>2</sub>) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of cilostazol to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of cilostazol to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Cilostazol RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cilostazol in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****Change to read:**• **DISSOLUTION** <711>**Test 1**

**Medium:** 0.30% sodium lauryl sulfate in water; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 60 min

**Standard solution:** 0.28 mg/mL (ERR 1-Jul-2012) of USP Cilostazol RS in methanol. Dilute this solution with *Medium* to obtain a solution with a final concentration of about 5.6 μg/mL (ERR 1-Jul-2012)

**Sample solution:** Pass NLT 20 mL of the solution under test through a suitable filter of 0.45-μm pore size, discarding the first 10 mL. Dilute with *Medium* to obtain a final theoretical concentration of about 5.6 μg/mL (ERR 1-Jul-2012) considering complete dissolution of the label claim.

**Wavelength:** UV 257 nm

**Path length:** 1 cm

**Blank:** *Medium*

Calculate the percentage of cilostazol dissolved:

$$\text{Result} = (A_U/A_S) \times (C_S/L) \times V \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$L$  = Tablet label claim

$V$  = volume of *Medium*, 900 mL

**Tolerances:** NLT 80% (Q) of the labeled amount of cilostazol is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.3% sodium lauryl sulfate in water; 900 mL, deaerated

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Standard solution:** Prepare a solution containing 1.1 mg/mL of USP Cilostazol RS in methanol. Dilute this solution with 0.5% sodium lauryl sulfate in water to obtain a final concentration of (L/900) mg/mL, where L is the Tablet label claim in mg.

**Sample solution:** Pass a portion of the solution under test through a suitable filter.

**Wavelength:** UV 258 nm

**Path length:** 0.2 cm

**Blank:** *Medium*

**Tolerances:** NLT 75% (Q) of the labeled amount of cilostazol is dissolved.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** 0.3% sodium lauryl sulfate in water; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 60 min

**Standard solution, Sample solution, Wavelength,**

**Path length, and Blank:** Proceed as directed for *Test 1*.

**Tolerances:** NLT 70% (Q) of the labeled amount of cilostazol is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight and light-resistant containers. Store at controlled room temperature.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** <11>  
USP Cilostazol RS

**Cimetidine**

C<sub>10</sub>H<sub>16</sub>N<sub>6</sub>S 252.34

Guanidine, N'-cyano-N-methyl-N'-[2-[[[(5-methyl-1H-imidazol-4-yl)methyl]thio]ethyl]-2-cyano-1-methyl-3-[[[(5-methylimidazol-4-yl)methyl]thio]ethyl]guanidine [51481-61-9].

» Cimetidine contains not less than 98.0 percent and not more than 102.0 percent of C<sub>10</sub>H<sub>16</sub>N<sub>6</sub>S, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Cimetidine RS

**Identification**—**A:** *Infrared Absorption* (197K).**B:** The UV absorption spectrum of a solution (1 in 80,000) in 0.1 N sulfuric acid exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Cimetidine RS, concomitantly measured.**Melting range** (741): between 139° and 144°.**Loss on drying** (731)—Dry it at 110° for 2 hours: it loses not more than 1.0% of its weight.**Residue on ignition** (281): not more than 0.2%.**Heavy metals, Method II** (231): 0.002%.**Chromatographic purity**—**Mobile phase**—Mix 240 mL of methanol, 0.3 mL of phosphoric acid (85%), 940 mg of sodium 1-hexanesulfonate, and sufficient water to make 1 L. Filter before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).**Standard solution**—Prepare a solution of USP Cimetidine RS in *Mobile phase* having a concentration of 0.80 µg per mL.**Test solution**—Transfer 100.0 mg of Cimetidine, accurately weighed, to a 250-mL volumetric flask, dissolve in about 50 mL of *Mobile phase*, and dilute with *Mobile phase* to volume. Mix, sonicate for 15 minutes, and mix again.**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard solution*, and record the peak response as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 3.0; the number of theoretical plates,  $n$ , is not less than 2000; and the relative standard deviation of the response for replicate injections is not more than 2.0%.**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Cimetidine taken by the formula:

$$100(0.001 C_s / C_u)(r_u / r_s)$$

in which  $C_s$  is the concentration, in µg per mL, of cimetidine in the *Standard solution*, the multiplier of 0.001 is for conversion of µg per mL to mg per mL;  $C_u$  is the concentration, in mg per mL, of Cimetidine in the *Test solution*;  $r_u$  is the peak response for each impurity obtained from the *Test solution*; and  $r_s$  is the response of the cimetidine peak obtained from the *Standard solution*: not more than 0.2% of any single impurity is found, and not more than 1.0% of total impurities is found.**Assay**—**Mobile phase**—Transfer 200 mL of methanol and 0.3 mL of phosphoric acid to a 1000-mL volumetric flask, dilute with water to volume, mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).**Standard preparation**—Dissolve an accurately weighed quantity of USP Cimetidine RS in a mixture of water and methanol (4:1) to obtain a stock solution having a known concentration of about 0.4 mg per mL by initially dissolving the Reference Standard in one part of methanol and diluting the methanolic solution quantitatively with about 4 parts of water to volume in a volumetric flask. Transfer 5.0 mL of this stock solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 10 µg per mL.**Assay preparation**—Transfer an accurately weighed quantity of about 100 mg of Cimetidine to a 250-mL volumetric flask, add 50 mL of methanol to dissolve the specimen, di-lute with water to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector, and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 0.6; the column efficiency determined from the analyte peak is not less than 1000 theoretical plates; and the relative standard deviation of the response for replicate injections is not more than 2.0%.**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $C_{10}H_{16}N_6S$  in the portion of Cimetidine taken by the formula:

$$10C(r_u / r_s)$$

in which  $C$  is the concentration, in µg per mL, of USP Cimetidine RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the Cimetidine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Cimetidine Tablets**

---

» Cimetidine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cimetidine ( $C_{10}H_{16}N_6S$ ).**Packaging and storage**—Preserve in tight, light-resistant containers, at controlled room temperature.**USP Reference standards** (11)—

USP Cimetidine RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.**Dissolution** (711)—**Medium:** 0.01 N hydrochloric acid; 900 mL.**Apparatus 1:** 100 rpm. A 20-mesh basket may be used for 800-mg strength Tablets.**Time:** 15 minutes.**Procedure**—Determine the amount of  $C_{10}H_{16}N_6S$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 218 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, in comparison with a *Standard solution* having a known concentration of USP Cimetidine RS in the same *Medium*.**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{10}H_{16}N_6S$  is dissolved in 15 minutes.**Uniformity of dosage units** (905): meet the requirements.**Assay**—**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Cimetidine*.**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of cimetidine, to a 250-mL volumetric flask. Add 50 mL of methanol, shake for 2 minutes, add 40 mL of water, sonicate for 15 minutes, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cimetidine ( $\text{C}_{10}\text{H}_{16}\text{N}_6\text{S}$ ) in the portion of Tablets taken by the formula:

$$10C(r_U / r_S)$$

in which the terms are as defined in the *Assay* under *Cimetidine*.

## Cimetidine Hydrochloride

$\text{C}_{10}\text{H}_{16}\text{N}_6\text{S} \cdot \text{HCl}$  288.80

Guanidine, *N''*-cyano-*N*-methyl-*N'*-[2-[(5-methyl-1*H*-imidazol-4-yl)methyl]thio]ethyl]-, monohydrochloride.  
2-Cyano-1-methyl-3-[2-[(5-methylimidazol-4-yl)methyl]thio]ethyl]guanidine monohydrochloride [70059-30-2].

» Cimetidine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{10}\text{H}_{16}\text{N}_6\text{S} \cdot \text{HCl}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Cimetidine Hydrochloride RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 14  $\mu\text{g}$  per mL.

*Medium:* 0.1 N sulfuric acid.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.002%.

### Chromatographic purity—

**Mobile phase**—Transfer about 940 mg of sodium 1-hexanesulfonate to a 1000-mL volumetric flask, add 240 mL of methanol followed by 0.3 mL of phosphoric acid, and dilute with water to volume. Mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Test solution 1**—Transfer about 100 mg of Cimetidine Hydrochloride, accurately weighed, to a 250-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Test solution 2**—Transfer 1.0 mL of *Test solution 1* to a 500-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Resolution solution**—Dissolve about 50 mg of Cimetidine Hydrochloride in 10 mL of 1 N hydrochloric acid, and heat on a steam bath for about 10 minutes (or boil on a hot plate for about 2 minutes), and allow to cool. Dilute a suitable volume of this solution with *Mobile phase* to obtain a solution having a concentration of about 2  $\mu\text{g}$  per mL. [NOTE—Use this solution within 24 hours of its preparation. Adjustment of the heating step may be necessary to achieve a satisfactory amide analog peak response for the measurement of the resolution between the cimetidine and the amide analog peaks.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as di-

rected for *Procedure*: the resolution,  $R$ , between the cimetidine and the amide analog peaks is not less than 4.0. Chromatograph *Test solution 2*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 3.0; the column efficiency is not less than 2000 theoretical plates; and the relative standard deviation for replicate injections is not more than 7.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of *Test solution 1* and *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity in the portion of Cimetidine Hydrochloride taken by the formula:

$$0.2(r_i / r_S)$$

in which  $r_i$  is the peak response for an individual impurity observed in the chromatogram obtained from *Test solution 1*, and  $r_S$  is the peak response of cimetidine in the chromatogram obtained from *Test solution 2*: no single impurity is greater than 0.2%, and the sum of all impurities is not more than 1.0%.

### Assay—

**Mobile phase**—Transfer 200 mL of methanol and 0.3 mL of phosphoric acid to a 1000-mL volumetric flask, dilute with water to volume, mix, and filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cimetidine Hydrochloride RS in a mixture of water and methanol (80:20) to obtain a solution having a known concentration of about 0.5 mg per mL. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer about 115 mg of Cimetidine Hydrochloride, accurately weighed, to a 250-mL volumetric flask, dissolve in about 50 mL of water, add 50 mL of methanol, and dilute with water to volume. Transfer 5.0 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $k'$ , is not less than 0.6; the column efficiency determined from the analyte peak is not less than 1000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $\text{C}_{10}\text{H}_{16}\text{N}_6\text{S} \cdot \text{HCl}$  in the portion of Cimetidine Hydrochloride taken by the formula:

$$10C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Cimetidine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the cimetidine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cimetidine Injection

» Cimetidine Injection is a sterile solution of Cimetidine Hydrochloride in Water for Injection. It contains not less than 90.0 percent and not

more than 110.0 percent of the labeled amount of  $C_{10}H_{16}N_6S$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**USP Reference standards** (11)—

USP Cimetidine Hydrochloride RS

USP Endotoxin RS

**Identification**—The chromatogram of the *Assay preparation* exhibits a major peak for cimetidine, the retention time of which corresponds to that of the cimetidine peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of cimetidine hydrochloride.

**pH** (791): between 3.8 and 6.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Cimetidine Hydrochloride*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2 mg of cimetidine, to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of  $C_{10}H_{16}N_6S$  in each mL of the Injection taken by the formula:

$$200(252.34/288.81)(C/V)(r_U/r_S)$$

in which 252.34 and 288.81 are the molecular weights of cimetidine and cimetidine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Cimetidine Hydrochloride RS in the *Standard preparation*; V is the volume of Injection taken; and  $r_U$  and  $r_S$  are the cimetidine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cimetidine in Sodium Chloride Injection

» Cimetidine in Sodium Chloride Injection is a sterile solution of Cimetidine Hydrochloride and Sodium Chloride in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cimetidine ( $C_{10}H_{16}N_6S$ ) and not less than 95.0 percent and not more than 110.0 percent of the labeled amount of sodium chloride (NaCl).

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**USP Reference standards** (11)—

USP Cimetidine Hydrochloride RS

USP Endotoxin RS

**Identification**—

A: The chromatogram obtained from the *Assay preparation* exhibits a major peak for cimetidine, the retention time

of which corresponds to that of the cimetidine peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

B: It responds to the tests for *Sodium* (191) and for *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of cimetidine hydrochloride.

**pH** (791): between 5.0 and 7.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for cimetidine**—

*Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Cimetidine Hydrochloride*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to 2 mg of cimetidine, to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of cimetidine ( $C_{10}H_{16}N_6S$ ) in each mL of the Injection taken by the formula:

$$200(252.34/288.81)(C/V)(r_U/r_S)$$

in which 252.34 and 288.81 are the molecular weights of cimetidine and cimetidine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Cimetidine Hydrochloride RS in the *Standard preparation*; V is the volume of Injection taken; and  $r_U$  and  $r_S$  are the cimetidine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for sodium chloride**—Dilute an accurately measured volume of Injection quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 0.5 mg of sodium chloride per mL. Titrate with 0.1 N silver nitrate VS, using a silver-silver chloride electrode. Each mL of 0.1 N silver nitrate is equivalent to 3.545 mg of chloride. From the determined chloride concentration per mL, subtract the quantity,  $(35.453/252.35)W$ , to correct for the chloride present as cimetidine hydrochloride, where W is the quantity, in mg per mL, of cimetidine in the Injection, as determined in the *Assay for cimetidine*. Multiply the corrected value by 1.648 to obtain the quantity, in mg per mL, of sodium chloride in the volume of Injection taken.

## Cinoxacin

$C_{12}H_{10}N_2O_5$  262.22  
[1,3]Dioxolo[4,5-g]cinnoline-3-carboxylic acid, 1-ethyl-1,4-dihydro-4-oxo-;  
1-Ethyl-1,4-dihydro-4-oxo[1,3]dioxolo[4,5-g]cinnoline-3-carboxylic acid [28657-80-9].

**DEFINITION**

Cinoxacin contains NLT 97.0% and NMT 102.0% of cinoxacin ( $C_{12}H_{10}N_2O_5$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197K>
- **B.** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of *Standard solution A*, as obtained in the test for *Organic Impurities*.

**ASSAY**• **PROCEDURE**

**Solution A:** 38.1 mg/mL of sodium borate in water

**Internal standard solution:** An aqueous solution containing 2 mg/mL of sulfanilic acid and 5.0 mL of *Solution A* in each 100 mL

**Mobile phase:** Dilute 100.0 mL of *Solution A* and 0.426 g of sodium sulfate with water to 1000 mL. The quantity of sodium sulfate may be varied to meet *System suitability* requirements and to provide a suitable elution time.

**Standard stock solution:** 1 mg/mL of USP Cinoxacin RS in *Solution A*

**Standard solution:** 50 µg/mL of USP Cinoxacin RS prepared as follows. Dilute 5.0 mL of *Standard stock solution* and 5.0 mL of *Internal standard solution* with water to 100 mL.

**Sample stock solution:** 1 mg/mL of Cinoxacin in *Solution A*

**Sample solution:** Dilute 5.0 mL of *Sample stock solution* and 5.0 mL of *Internal standard solution* with water to 100 mL.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 1.8-mm × 1-m; packing L12

**Flow rate:** 1 mL/min

**Injection volume:** 1.0 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for cinoxacin and sulfanilic acid are 1.0 and 2.2, respectively.]

**Suitability requirements**

**Resolution:** NLT 4.4 between cinoxacin and sulfanilic acid

**Tailing factor:** NMT 2.1 for cinoxacin

**Relative standard deviation:** NMT 2.0% from five replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cinoxacin ( $C_{12}H_{10}N_2O_5$ ) in the portion of Cinoxacin taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of cinoxacin to sulfanilic acid from the *Sample solution*

$R_S$  = peak response ratio of cinoxacin to sulfanilic acid from the *Standard solution*

$C_S$  = concentration of USP Cinoxacin RS in the *Standard solution* (µg/mL)

$C_U$  = concentration of Cinoxacin in the *Sample solution* (µg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

**IMPURITIES**• **ORGANIC IMPURITIES**

**Diluent:** Chloroform, dimethylformamide, dimethyl sulfide, and nitromethane (1:1:1:1)

**Standard solution A:** 5 mg/mL of USP Cinoxacin RS in *Diluent*

**Standard solution B:** 0.05 mg/mL from *Standard solution A* in *Diluent*

**Sample solution:** 5 mg/mL of Cinoxacin in *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 µL

**Developing solvent system:** Acetonitrile, ammonium hydroxide, and water (105: 7.5: 30)

**Analysis**

**Samples:** *Standard solution A*, *Standard solution B*, and *Sample solution*

In a suitable chromatographic chamber lined with paper, place a volume of the *Developing solvent system* sufficient to develop the chromatogram, cover, and allow to equilibrate for 30 min. Apply the *Samples*, dry the plate, and apply each sample three additional times at the corresponding initial locations. Dry the plate thoroughly after each application, and develop the chromatogram until the solvent front has moved to the top of the plate. Remove the plate from the chamber, and allow the solvent to evaporate. View the plate under short- and long-wavelength UV light.

**Acceptance criteria:** 1.0%; the  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of *Standard solution A*, and no spot of the *Sample solution* other than the principal spot is larger or more intense than the principal spot of *Standard solution B*.

**SPECIFIC TESTS**• **LOSS ON DRYING** <731>

**Analysis:** Dry a sample under vacuum at 60° for 3 h.

**Acceptance criteria:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** <11>

USP Cinoxacin RS

---

**Cinoxacin Capsules**

---

**DEFINITION**

Cinoxacin Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of cinoxacin ( $C_{12}H_{10}N_2O_5$ ).

**IDENTIFICATION**• **A. THIN-LAYER CHROMATOGRAPHY**

**Diluent:** Chloroform, dimethylformamide, dimethyl sulfide, and nitromethane (1:1:1:1)

**Standard solution:** 5 mg/mL of USP Cinoxacin RS in *Diluent*

**Sample solution:** Equivalent to 5 mg/mL of cinoxacin from Capsules in *Diluent*

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 10 µL

**Developing solvent system:** Acetonitrile, ammonium hydroxide, and water (105: 7.5: 30)

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

In a suitable chromatographic chamber lined with paper, place a volume of the *Developing solvent system* sufficient to develop the chromatogram, cover, and allow to equilibrate for 30 min. Apply the *Samples*, dry the plate, and apply each sample three additional times at the corresponding initial locations. Dry the plate thoroughly after each application, and develop the chromatogram until the solvent front has moved to the top of the plate. Remove the plate from the chamber, and allow the solvent to evaporate. View the plate under short- and long-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY****• PROCEDURE**

**Sample solution:** Nominally 10 µg/mL prepared as follows. Transfer an equivalent to 250 mg of cinoxacin to a 100-mL volumetric solution from the contents of NLT 20 Capsules. Dilute with 0.1 M sodium borate to volume. Filter the solution, discarding the first 20 mL of the filtrate, and dilute with water to 10 µg/mL.

**Standard stock solution:** 2.5 mg/mL of USP Cinoxacin RS in 0.1 M sodium borate

**Standard solution:** 10 µg/mL of USP Cinoxacin RS in water, prepared from *Standard stock solution*

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** 352 nm

**Cell:** 1 cm

**Blank:** 0.1 M sodium borate and water (2 in 500)

**Analysis**

**Samples:** *Sample solution* and *Standard solution*

Calculate the percentage of the labeled amount of cinoxacin (C<sub>12</sub>H<sub>10</sub>N<sub>2</sub>O<sub>5</sub>) in the portion of Capsules taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>**

**Buffer:** pH 6.5 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*)

**Medium:** *Buffer*, 500 mL for Capsules containing 250 mg or less of cinoxacin; 1000 mL for Capsules containing more than 250 mg of cinoxacin

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Standard solution:** 0.35 mg/mL of USP Cinoxacin RS in *Medium*

**Sample solutions:** Filter, and dilute with 0.1 N sodium hydroxide solution as needed.

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** 270 nm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 60% (Q) of the labeled amount of cinoxacin (C<sub>12</sub>H<sub>10</sub>N<sub>2</sub>O<sub>5</sub>) is dissolved.

**• UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in well-closed containers.**• USP REFERENCE STANDARDS <11>**  
USP Cinoxacin RS

3-Quinolinecarboxylic acid, 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-;  
1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid [85721-33-1].

**DEFINITION**

Ciprofloxacin contains NLT 98.0% and NMT 102.0% of C<sub>17</sub>H<sub>18</sub>FN<sub>3</sub>O<sub>3</sub>, calculated on the dried basis.

**IDENTIFICATION**

**• A. INFRARED ABSORPTION:** The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima at the same wavelengths as that of a similar preparation of USP Ciprofloxacin RS.

**• B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Solution A:** 0.025 M phosphoric acid. Adjust with triethylamine to a pH of 3.0 ± 0.1.

**Mobile phase:** Acetonitrile and *Solution A* (13:87)

**Standard solution:** Transfer 12.5 mg of USP Ciprofloxacin RS to a 25-mL volumetric flask. Add 0.1 mL of 7% phosphoric acid, and dilute with *Mobile phase* to volume.

**System suitability stock solution:** 0.025 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase*

**System suitability solution:** Transfer 1.0 mL of the *System suitability stock solution* to a 10-mL volumetric flask, and dilute with the *Standard solution* to volume.

**Sample solution:** Transfer 25 mg of Ciprofloxacin to a 50-mL volumetric flask. Add 0.2 mL of 7% phosphoric acid, and dilute with *Mobile phase* to volume.

**Chromatographic system**

(See *Chromatography <621>*, *System Suitability*.)

**Mode:** LC

**Detector:** UV 278 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Column temperature:** 30 ± 1°

**Flow rate:** 1.5 mL/min

**Injection size:** 10 µL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 6 between ciprofloxacin ethylenediamine analog and ciprofloxacin, *System suitability solution*

**Column efficiency:** NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*

**Tailing factor:** NMT 2.5 for the ciprofloxacin peak, *Standard solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>17</sub>H<sub>18</sub>FN<sub>3</sub>O<sub>3</sub> in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Ciprofloxacin RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Ciprofloxacin in the *Sample solution* (mg/mL)

**Ciprofloxacin**

Acceptance criteria: 98.0%–102.0% on the dried basis

## IMPURITIES

### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%, except that where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is NMT 0.2%.

- **CHLORIDE**

**Standard solution:** 8.2 µg/mL of sodium chloride (5 µg/mL of chloride)

**Sample solution:** Add 30.0 mL of water to 0.5 g of Ciprofloxacin, shake for 5 min, and pass through chloride-free filter paper. Use the filtrate as the *Sample solution*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Transfer 15.0 mL of the *Sample solution* to a 50-mL color-comparison tube. Transfer 10.0 mL of the *Standard solution* to a second matched 50-mL color-comparison tube, add 5.0 mL of water, and mix. To each tube add 1 mL of 2 N nitric acid, mix, add 1 mL of silver nitrate TS, and mix.

**Acceptance criteria:** The turbidity exhibited by the *Sample solution* does not exceed that of the *Standard solution* (0.02%).

- **SULFATE**

**Standard solution:** 18.1 µg/mL of potassium sulfate in 30% alcohol (10 µg/mL of sulfate)

**Sample solution:** Dissolve 0.5 g of Ciprofloxacin in 5.0 mL of 2 N acetic acid and 15.0 mL of water.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
To each of two 50-mL matched color-comparison tubes transfer 1.50 mL of the *Standard solution*. To each tube add, successively and with continuous shaking, 1.0 mL of 250 mg/mL barium chloride solution, and allow to stand for 1 min. To one of the tubes transfer 15.0 mL of the *Standard solution* and 0.5 mL of 30% acetic acid, and mix. To the second tube add 15.0 mL of the *Sample solution* and 0.5 mL of 30% acetic acid, and mix.

**Acceptance criteria:** The turbidity exhibited in the tube containing the *Sample solution* does not exceed that of the tube containing the *Standard solution* (0.04%).

- **HEAVY METALS, Method II** (231): NMT 20 ppm

### Organic Impurities

- **PROCEDURE 1: LIMIT OF FLUOROQUINOLONIC ACID**

**Standard stock solution:** Transfer 5.0 mg of USP Fluoroquinolonic Acid RS to a 50-mL volumetric flask containing 0.05 mL of 6 N ammonium hydroxide, and dilute with water to volume.

**Standard solution:** Dilute 2.0 mL of the *Standard stock solution* with water to 10.0 mL.

**Sample solution:** 10.0 mg/mL of Ciprofloxacin in 0.1 N acetic acid

**Developing solvent system:** Methylene chloride, methanol, acetonitrile, and ammonium hydroxide (4:4:1:2)

#### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of silica gel mixture

**Application volume:** 5 µL

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Place the plate in a suitable chamber in which is placed a beaker containing 50 mL of ammonium hydroxide. After 15 min, transfer the plate to a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for

about 15 min. Examine the plate under short-wave-length UV light.

**Acceptance criteria:** Any spot from the *Sample solution*, at an  $R_f$  value corresponding to the principal spot from the *Standard solution*, is not greater in size or intensity than the principal spot from the *Standard solution* (0.2%).

- **PROCEDURE 2**

**Solution A, Mobile phase, System suitability stock solution, System suitability solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Ciprofloxacin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = response of each impurity peak

$r_T$  = sum of the responses of all the peaks

#### Acceptance criteria

**Ciprofloxacin ethylenediamine analog or any other individual impurity peak:** NMT 0.2%

**Total impurities:** NMT 0.5%

### SPECIFIC TESTS

- **CLARITY OF SOLUTION:** Dissolve 0.25 g in 10 mL of 0.1 N hydrochloric acid: a clear to slightly opalescent solution is obtained.

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, the total microbial count does not exceed 1000 cfu/g, and the total combined molds and yeasts count does not exceed 100 cfu/g. It also meets the requirement for absence of *Salmonella* species and *Escherichia coli*.

- **LOSS ON DRYING** (731): Dry a sample in a vacuum at 120° for 6 h: it loses NMT 1.0% of its weight, except that where it is labeled as intended for use in preparing Ciprofloxacin for Oral Suspension, it loses between 10% and 20% of its weight.

- **STERILITY TESTS** (71): Where the label states that it is sterile, it meets the requirements for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

- **BACTERIAL ENDOTOXINS TEST** (85): Where the label states that it is sterile or where the label states that Ciprofloxacin must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.50 USP Endotoxin Unit/mg of ciprofloxacin.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursion permitted between 15° and 30°, and avoid excessive heat.

- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms. Where it is intended for use in preparing Ciprofloxacin for Oral Suspension, it is so labeled.

- **USP REFERENCE STANDARDS** (11)

USP Ciprofloxacin RS

USP Ciprofloxacin Ethylenediamine Analog RS

1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-[(2-aminoethyl)amino]-3-quinolinecarboxylic acid hydrochloride.

$C_{15}H_{16}FN_3O_3 \cdot HCl$  341.77

USP Endotoxin RS

USP Fluoroquinolonic Acid RS

## Ciprofloxacin Hydrochloride

$C_{17}H_{18}FN_3O_3 \cdot HCl \cdot H_2O$  385.82

3-Quinolonecarboxylic acid, 1-cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-, monohydrochloride, monohydrate;

1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-(1-piperazinyl)-3-quinolinecarboxylic acid, monohydrochloride, monohydrate [86393-32-0].

### DEFINITION

Ciprofloxacin Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{17}H_{18}FN_3O_3 \cdot HCl$ , calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **C. IDENTIFICATION TESTS—GENERAL, Chloride** <191>

### ASSAY

#### • PROCEDURE

**Solution A:** 0.025 M phosphoric acid. Adjust with triethylamine to a pH of  $3.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Solution A* (13:87)

**Standard solution:** 0.5 mg/mL of USP Ciprofloxacin Hydrochloride RS in *Mobile phase*

**System suitability solution:** 0.025 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase*. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with *Standard solution* to volume.

**Sample solution:** 0.5 mg/mL of Ciprofloxacin Hydrochloride in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 278 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Column temperature:**  $30 \pm 1^\circ$

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 6 between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak, *System suitability solution*

**Column efficiency:** NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*

**Tailing factor:** NMT 2.5 for the ciprofloxacin peak, *Standard solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{17}H_{18}FN_3O_3 \cdot HCl$  in the portion of Ciprofloxacin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area response from the *Sample solution*  
 $r_S$  = peak area response from the *Standard solution*  
 $C_S$  = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Ciprofloxacin Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** <281>: NMT 0.1%
- **CHLORIDE AND SULFATE, Sulfate** <221>: A 375-mg portion shows no more sulfate than corresponds to 0.15 mL of 0.020 N sulfuric acid (0.04%).
- **HEAVY METALS, Method II** <231>: NMT 20 ppm

#### Organic Impurities

##### • PROCEDURE 1: LIMIT OF FLUOROQUINOLONIC ACID

**Standard solution:** Transfer 5.0 mg of USP Fluoroquinolonic Acid RS to a 50-mL volumetric flask containing 0.05 mL of 6 N ammonium hydroxide, add water to volume, and mix. Transfer 2.0 mL of this solution to a 10.0-mL volumetric flask, and dilute with water to volume.

**Sample solution:** 10 mg/mL of Ciprofloxacin Hydrochloride in water

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of silica gel mixture

**Application volume:** 5  $\mu$ L

**Developing solvent system:** Methylene chloride, methanol, acetonitrile, and ammonium hydroxide (4:4:1:2)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Proceed as directed in the chapter. Place a beaker containing 50 mL of ammonium hydroxide in a suitable chamber, and then place the plate in the chamber. After 15 min, transfer the plate to a suitable chromatographic chamber, and develop the chromatogram in the *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the plate to air-dry for about 15 min. Examine the plate under short-wavelength UV light.

**Acceptance criteria:** Any spot from the *Sample solution*, at an  $R_f$  value corresponding to the principal spot from the *Standard solution*, is not greater in size or intensity than the principal spot from the *Standard solution* (0.2%).

##### • PROCEDURE 2

**Mobile phase, Standard solution, System suitability solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

#### Analysis

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Ciprofloxacin Hydrochloride taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity

$r_T$  = sum of the responses of all the peaks

#### Acceptance criteria

**Individual impurities:** NMT 0.2% for the ciprofloxacin ethylenediamine analog or any other individual impurity peak

Total impurities: NMT 0.5%

#### SPECIFIC TESTS

- **pH** (791): 3.0–4.5, in a 25 mg/mL solution
- **WATER DETERMINATION, Method I** (921): 4.7%–6.7%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)
  - USP Ciprofloxacin Ethylenediamine Analog RS
  - 1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-[(2-aminoethyl)amino]-3-quinolinecarboxylic acid hydrochloride.
  - $C_{15}H_{16}FN_3O_3 \cdot HCl$  341.77
  - USP Ciprofloxacin Hydrochloride RS
  - USP Fluoroquinolonic Acid RS

### Ciprofloxacin and Dexamethasone Otic Suspension

» Ciprofloxacin and Dexamethasone Otic Suspension is a sterile aqueous suspension containing ciprofloxacin hydrochloride and dexamethasone. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ), and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight containers, protected from light. Avoid freezing.

#### USP Reference standards (11)—

- USP Ciprofloxacin Ethylenediamine Analog RS
- 1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-[(2-aminoethyl)amino]-3-quinolinecarboxylic acid hydrochloride.
- $C_{15}H_{16}FN_3O_3 \cdot HCl$  341.77
- USP Ciprofloxacin Formamide RS
- USP Ciprofloxacin Hydrochloride RS
- USP Dexamethasone RS
- USP Dexamethasone Acetate RS

#### Identification—

**A:** The chromatogram of the *Assay preparation*, obtained as directed in the *Assay for ciprofloxacin*, exhibits a major peak for ciprofloxacin, the retention time of which corresponds to that obtained in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay for ciprofloxacin*.

**B:** The chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dexamethasone*, exhibits a major peak for dexamethasone, the retention time of which corresponds to that obtained in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay for dexamethasone*.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 3.8 and 4.8.

#### Particle size—

**Carrier fluid**—Heat Purified Water to a temperature of 40° to 50°, add 100 mg of dexamethasone per L while stirring, cool to room temperature while stirring, pass through a 0.2- $\mu$ m filter, and store in a clean, covered container.

**Test preparation**—Dilute a volume of about 10  $\mu$ L of Otic Suspension with *Carrier fluid* to 25 mL.

**Procedure**—(see *Light Obscuration Particle Count Test* under *Particulate Matter in Injections* (788)). Analyze the *Test preparation* using an electronic, liquid-borne particle counting system that employs a light obscuration sensor with a suitable sample feeding device. Not less than 99.5% of the particles are  $\leq 25$   $\mu$ m, not less than 99.95% are  $\leq 50$   $\mu$ m, and not less than 99.995% are  $\leq 100$   $\mu$ m.

**Osmolality** (785): between 270 and 330 mOsmol per kg.

#### Limit of ciprofloxacin formamide—

**Buffer**—Add 6.0 mL of phosphoric acid to 2.0 L of water. Adjust with 50% sodium hydroxide to a pH of 3.0.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (73:27). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Transfer about 25 mg of USP Ciprofloxacin Formamide RS, accurately weighed, to a 100-mL volumetric flask, and dissolve in and dilute with methanol to volume. Transfer 3.0 mL of this solution to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.015 mg per mL.

**System suitability solution**—Transfer about 2.5 mg of USP Dexamethasone RS and about 2.5 mg of USP Ciprofloxacin Formamide RS to a 100-mL volumetric flask. Dissolve in 15 mL of methanol, then dilute with *Mobile phase* to volume.

**Test solution**—Transfer an accurately measured volume of freshly mixed Otic Suspension, equivalent to about 6 mg of ciprofloxacin, to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the column efficiency for ciprofloxacin formamide is not less than 2000 theoretical plates; the resolution,  $R$ , between ciprofloxacin formamide and dexamethasone is not less than 8; and the tailing factor for ciprofloxacin formamide is not more than 2.0. The relative standard deviation for replicate injections of the *Standard solution* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the peaks at the retention time of ciprofloxacin formamide. Calculate the percentage of ciprofloxacin formamide in the portion of the Otic Suspension taken by the formula:

$$10(C/VL)(r_U / r_S)100$$

in which  $C$  is the concentration, in mg per mL, of USP Ciprofloxacin Formamide RS in the *Standard solution*;  $V$  is the volume, in mL, of Otic Suspension taken;  $L$  is the labeled amount, in mg per mL, of ciprofloxacin; and  $r_U$  and  $r_S$  are the ciprofloxacin formamide peak responses obtained from the *Test solution* and the *Standard solution*, respectively. Ciprofloxacin formamide is not more than 0.5% of the labeled amount of ciprofloxacin.

#### Ciprofloxacin related compounds—

**Procedure**—From the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for ciprofloxacin*, measure the responses for the ciprofloxacin ethylenediamine analog and the other minor peaks. Calculate the percentage

of each related compound in the portion of Otic Suspension taken by the formula:

$$(331.34/367.81)25(C/V)(r_U/r_S)100/FL$$

in which 331.34 and 367.81 are the molecular weights of ciprofloxacin and anhydrous ciprofloxacin hydrochloride, respectively;  $C$  is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Dilute standard preparation*, calculated on the anhydrous basis;  $V$  is the volume, in mL, of Otic Suspension taken;  $r_U$  and  $r_S$  are the related compound peak responses obtained from the *Assay preparation* and the ciprofloxacin peak response obtained from the *Dilute standard preparation*, respectively;  $F$  is the relative response factor (1.3 for ciprofloxacin ethylenediamine analog and 1.0 assumed for all other degradation products); and  $L$  is the labeled amount, in mg per mL, of ciprofloxacin. The ciprofloxacin ethylenediamine analog is not more than 0.4% of the labeled amount of ciprofloxacin. No other single related compound is greater than 0.2%, and the sum of all related compounds found is not more than 0.8%.

#### Dexamethasone related compounds—

**Procedure**—From the chromatogram of the *Assay preparation*, obtained as directed in the *Assay for dexamethasone*, measure the responses for the 21-dehydro-17-deoxy related compound, the 20-carboxy-17-deoxy related compound, and other minor peaks. Calculate the percentage of each related compound in the portion of the Otic Suspension taken by the formula:

$$10(C/VL)(r_U/r_S)100$$

in which  $C$  is the concentration, in mg per mL, of USP Dexamethasone RS in the *Dilute standard preparation*;  $V$  is the volume, in mL, of Otic Suspension taken;  $L$  is the labeled amount, in mg per mL, of dexamethasone; and  $r_U$  and  $r_S$  are the related compound peak responses obtained from the *Assay preparation* and the dexamethasone peak response obtained from the *Dilute standard preparation*, respectively. The 21-dehydro-17-deoxy related compound is not more than 1.0%, the 20-carboxy-17-deoxy related compound is not more than 2.6%, no other related compound is greater than 0.3%, and the sum of all related compounds found is not more than 3.5%. [NOTE—Identification of known related compounds is accomplished by measuring relative retention times versus dexamethasone. The relative retention times are about 1.4 to 1.6 for the 21-dehydro-17-deoxy related compound and about 2.8 to 3.2 for the 20-carboxy-17-deoxy related compound.]

#### Assay for ciprofloxacin—

**Buffer**—Add 6.0 mL of phosphoric acid and 8 g of diethylamine phosphate to 2.0 L of water. Adjust with 50% sodium hydroxide to a pH of 3.0.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (89:11). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Accurately weigh about 37 mg of USP Ciprofloxacin Hydrochloride RS into a 25-mL volumetric flask, and dissolve in and dilute with 0.1 N hydrochloric acid to volume. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, and dissolve in and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.13 mg of ciprofloxacin per mL.

**Dilute standard preparation**—Transfer 2.0 mL of the *Standard preparation* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution having a known concentration of about 0.0025 mg of ciprofloxacin per mL.

**System suitability solution**—Weigh about 1 mg of USP Ciprofloxacin Hydrochloride RS and 1 mg of USP Ciprofloxacin Ethylenediamine Analog RS into a 25-mL volumetric flask, and dilute with *Mobile phase* to volume. Transfer

2.0 mL of this solution to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

**Assay preparation**—Transfer an accurately measured volume of freshly mixed Otic Suspension, equivalent to about 3 mg of ciprofloxacin, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between ciprofloxacin and the ciprofloxacin ethylenediamine analog is not less than 3.0; the column efficiency for ciprofloxacin is not less than 2500 theoretical plates; and the tailing factor for ciprofloxacin is not more than 2.0. The relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%; and the relative standard deviation for replicate injections of the *Dilute standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ) in each mL of the Otic Suspension taken by the formula:

$$(331.34/367.81)(25C/V)(r_U/r_S)$$

in which 331.34 and 367.81 are the molecular weights of ciprofloxacin and anhydrous ciprofloxacin hydrochloride, respectively;  $C$  is the concentration, in mg per mL, of USP Ciprofloxacin Hydrochloride RS in the *Standard preparation*, calculated on the anhydrous basis;  $V$  is the volume, in mL, of Otic Suspension taken; and  $r_U$  and  $r_S$  are the ciprofloxacin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for dexamethasone—

**Buffer and Mobile phase**—Prepare as directed under *Limit of ciprofloxacin formamide*.

**Standard preparation**—Transfer about 50 mg of USP Dexamethasone RS, accurately weighed, to a 25-mL volumetric flask, dilute with acetonitrile to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. This solution contains about 0.2 mg of USP Dexamethasone RS per mL.

**Dilute standard preparation**—Transfer 2.0 mL of the *Standard preparation* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. This solution contains about 0.004 mg of USP Dexamethasone RS per mL.

**System suitability solution**—Transfer about 2 mg of USP Dexamethasone RS and about 2 mg of USP Dexamethasone Acetate RS to a 10-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of freshly mixed Otic Suspension, equivalent to about 2 mg of dexamethasone, to a 10-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the column efficiency for dexamethasone is not less than 2000 theoretical plates; the resolution,  $R$ , between dexamethasone and dexamethasone acetate is not less than 12; the tailing factor for dexamethasone is not more than 2.0; the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%; and the relative standard deviation for replicate injections of the *Dilute standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dexamethasone ( $C_{22}H_{29}FO_5$ ) in each mL of the Otic Suspension taken by the formula:

$$10(C/V)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*; V is the volume, in mL, of Otic Suspension taken; and  $r_U$  and  $r_S$  are the dexamethasone peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Ciprofloxacin Injection

### DEFINITION

Ciprofloxacin Injection is a sterile solution of Ciprofloxacin or Ciprofloxacin Hydrochloride in Water for Injection, in 5% Dextrose Injection, or in 0.9% Sodium Chloride Injection prepared with the aid of Lactic Acid. It contains NLT 90.0% and NMT 110.0% of the labeled amount of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ).

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Solution A:** 0.025 M phosphoric acid. Adjust with triethylamine to a pH of  $3.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and Solution A (13:87)

**Standard solution:** 0.5 mg/mL of USP Ciprofloxacin Hydrochloride RS in *Mobile phase*

**System suitability solution:** 0.025 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Mobile phase*. Transfer 1.0 mL of this solution to a 10-mL volumetric flask, and dilute with *Standard solution* to volume.

**Sample solution:** Equivalent to 0.5 mg/mL of Ciprofloxacin from Injection diluted with *Mobile phase*

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 278 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Temperature:**  $30 \pm 1^\circ$

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 6 between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak

**Column efficiency:** NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*

**Tailing factor:** NMT 2.5 for the ciprofloxacin peak, *Standard solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of  $C_{17}H_{18}FN_3O_3$  from the portion of Ciprofloxacin Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of ciprofloxacin in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of ciprofloxacin, 331.34

$M_{r2}$  = molecular weight of anhydrous ciprofloxacin hydrochloride, 367.81

**Acceptance criteria:** 90.0%–110.0%

### OTHER COMPONENTS

#### LACTIC ACID CONTENT

**Mobile phase:** Acetonitrile and 0.005 N sulfuric acid (3:17)

**Standard solution:** 0.8 mg/mL of USP Sodium Lactate RS in water or 4 mg/mL where the Injection is labeled as being a concentrated form

**Sample solution:** Use the undiluted Injection.

#### Chromatographic system

(See Chromatography <621>, System Suitability.)

**Mode:** LC

**Detector:** UV 208 nm

**Column:** 7.8-mm  $\times$  30-cm; packing L17

**Temperature:**  $40 \pm 1^\circ$

**Flow rate:** 0.6 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for the analyte peak

**Relative standard deviation:** NMT 2.0%

[NOTE—After each analysis, rinse the column with a mixture of 0.01 N sulfuric acid and acetonitrile to elute the ciprofloxacin from the column. Promptly regenerate the column with 0.01 N sulfuric acid, and the column may be reused or stored.]

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration of lactic acid ( $C_3H_6O_3$ ) in mg/mg of ciprofloxacin:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2})$$

$r_U$  = peak response of lactic acid from the *Sample solution*

$r_S$  = peak response of lactic acid from the *Standard solution*

$C_S$  = concentration of USP Sodium Lactate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of ciprofloxacin in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of lactic acid, 90.08

$M_{r2}$  = molecular weight of sodium lactate, 112.07

**Acceptance criteria:** 0.288–0.352 mg of lactic acid for each mg of ciprofloxacin claimed on the label, except that where the Injection is labeled as being a concentrated form, it contains 0.335–0.409 mg of lactic acid for each mg of ciprofloxacin claimed on the label

#### DEXTROSE CONTENT (if present)

**Sample solution:** Undiluted Injection

**Analysis:** Determine the angular rotation in a suitable polarimeter tube (see Optical Rotation <781>).

Calculate the percentage (g/100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken:

$$\text{Result} = A \times R \times (M_{r1}/M_{r2}) \times (100/F)$$

- A = 100 mm divided by the length of the polarimeter tube (mm)  
 R = observed rotation (degrees)  
 $M_{r1}$  = molecular weight of dextrose monohydrate, 198.17  
 $M_{r2}$  = molecular weight of anhydrous dextrose, 180.16  
 F = midpoint of the specific rotation range for anhydrous dextrose, 52.9°

Acceptance criteria: 4.75–5.25 g/100 mL

• **SODIUM CHLORIDE CONTENT** (if present)

Sample solution: Injection

Analysis: Transfer 10.0 mL of *Sample solution* to a suitable container, dilute with water to 150 mL, add 1.5 mL of potassium chromate TS, and titrate with 0.1 N silver nitrate TS. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride (NaCl).

Acceptance criteria: 85.5–94.5 mg

**IMPURITIES**

**Organic Impurities**

• **PROCEDURE: LIMIT OF CIPROFLOXACIN ETHYLENEDIAMINE ANALOG**

Mobile phase, System suitability solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the Assay.

**Analysis**

Sample: *Sample solution*

Calculate the percentage of ciprofloxacin ethylenediamine analog from the portion of Ciprofloxacin Injection taken:

$$\text{Result} = [F \times r_A / (F \times r_A + r_C)] \times 100$$

- F = correction factor for ciprofloxacin ethylenediamine analog, 0.7  
 $r_A$  = ciprofloxacin ethylenediamine analog peak response  
 $r_C$  = peak response of ciprofloxacin

Acceptance criteria: NMT 0.5%

**SPECIFIC TESTS**

- **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements
- **PH** <791>: 3.5–4.6, except that where the Injection is labeled as being a concentrated form, its pH is 3.3–3.9
- **BACTERIAL ENDOTOXINS TEST** (85): It contains NMT 0.50 USP Endotoxin Unit/mg of ciprofloxacin.
- **STERILITY TESTS** <71>: It meets the requirements for *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **COLOR AND ACHROMICITY** <631> (where it is labeled as being a concentrated form): It has no more color than a solution prepared by diluting 5.0 mL of *Matching Fluid O* with 95.0 mL of 0.12 N hydrochloric acid.
- **OTHER REQUIREMENTS**: It meets the requirements for *Injections* <1>, *Container Content*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE**: Preserve in single-dose containers, preferably of Type I glass, and store in a cool place or at controlled room temperature. Avoid freezing and exposure to light.
- **LABELING**: The label indicates whether the vehicle is Sterile Water for Injection, 5% Dextrose Injection, or 0.9% Sodium Chloride Injection. Label the Injection that has Sterile Water for Injection as the vehicle to indicate that it is a concentrated form that must be diluted to appropriate strength (1–2 mg/mL) with 5% Dextrose Injection or

0.9% Sodium Chloride Injection before administration, and that the resulting solution is stable for up to 14 days when stored in a cool place or at controlled room temperature.

• **USP REFERENCE STANDARDS** <11>

- USP Ciprofloxacin Ethylenediamine Analog RS  
 1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-[(2-aminoethyl)amino]-3-quinolinecarboxylic acid hydrochloride.  
 $C_{15}H_{16}FN_3O_3 \cdot HCl$  341.77  
 USP Ciprofloxacin Hydrochloride RS  
 USP Endotoxin RS  
 USP Sodium Lactate RS

## Ciprofloxacin Ophthalmic Ointment

**DEFINITION**

Ciprofloxacin Ophthalmic Ointment contains an amount of Ciprofloxacin Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

• **PROCEDURE**

Buffer: 0.005 M tetrabutylammonium phosphate solution. Adjust with phosphoric acid to a pH of 2.0.

Mobile phase: Methanol and Buffer (250:750)

Standard solution: 0.033 mg/mL of USP Ciprofloxacin Hydrochloride RS in 0.1 N hydrochloric acid

System suitability solution: 0.005 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in *Standard solution*

Sample solution: Transfer an amount nominally equivalent to 750 µg of ciprofloxacin from Ophthalmic Ointment to a screw-capped tube. Add 15 mL of solvent hexane, and shake vigorously until the Ophthalmic Ointment is dispersed. Loosen the cap, and heat in a water bath at 60° for 30 min, with occasional swirling. Remove from the bath, tighten the cap, and shake for 1.5 min while still hot. Add 25.0 mL of 0.1 N hydrochloric acid, and shake vigorously for 1.5 min. Allow the layers to separate, and use the lower, aqueous layer.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 280 nm

Column: 4.6-mm × 25-cm; packing L1

Flow rate: 1.5 mL/min

Injection volume: 20 µL

**System suitability**

Samples: *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for the ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.8 and 1.0, respectively.]

**Suitability requirements**

Resolution: NLT 2.0 between ciprofloxacin ethylenediamine analog and ciprofloxacin, *System suitability solution*

Column efficiency: NLT 500 theoretical plates, *Standard solution*

Tailing factor: 0.9–2.0, *Standard solution*

Relative standard deviation: NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the label claim of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ) in the portion of Ophthalmic Ointment taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of ciprofloxacin in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of ciprofloxacin, 331.34  
 $M_{r2}$  = molecular weight of anhydrous ciprofloxacin hydrochloride, 367.81  
**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL <755>:** Meets the requirements

**SPECIFIC TESTS**

- **STERILITY TESTS <71>:** It meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*.
- **METAL PARTICLES IN OPHTHALMIC OINTMENTS <751>:** Meets the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible ophthalmic ointment tubes. Store at a temperature between 2° and 25°.
- **USP REFERENCE STANDARDS <11>**  
 USP Ciprofloxacin Ethylenediamine Analog RS  
 1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-[(2-aminoethyl)amino]-3-quinolinecarboxylic acid hydrochloride.  
 $C_{15}H_{16}FN_3O_3 \cdot HCl$  341.77  
 USP Ciprofloxacin Hydrochloride RS

**Ciprofloxacin Tablets**

---

**DEFINITION**

Ciprofloxacin Tablets contain Ciprofloxacin Hydrochloride equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Solution A:** 0.025 M phosphoric acid. Adjust with triethylamine to a pH of  $2.0 \pm 0.1$ .

**Solution B:** Acetonitrile and *Solution A* (13:87)

**Solution C:** 0.025 M phosphoric acid. Adjust with triethylamine to a pH of  $3.0 \pm 0.1$ .

**Mobile phase:** Acetonitrile and *Solution C* (13:87)

**Standard solution:** 0.2 mg/mL of USP Ciprofloxacin Hydrochloride RS in *Solution B*

**System suitability solution:** 0.05 mg/mL of USP Ciprofloxacin Ethylenediamine Analog RS in the *Standard solution*

**Sample solution:** Transfer 5 Tablets to a 500-mL volumetric flask, add 400 mL of *Solution B*, and sonicate for about 20 min. Dilute with *Solution B* to volume, mix, and pass through a membrane filter of 0.45- $\mu$ m pore size. Prepare the equivalent of 0.20 mg/mL of ciprofloxacin from the filtrate with *Solution B*.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 278 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L1

**Column temperature:**  $30 \pm 1^\circ$

**Flow rate:** 1.5 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The retention time for ciprofloxacin is 6.4–10.8 min. The relative retention times for ciprofloxacin ethylenediamine analog and ciprofloxacin are 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 6 between the ciprofloxacin ethylenediamine analog peak and the ciprofloxacin peak, *System suitability requirements*

**Column efficiency:** NLT 2500 theoretical plates from the ciprofloxacin peak, *Standard solution*

**Tailing factor:** NMT 2.0 for the ciprofloxacin peak, *Standard solution*

**Relative standard deviation:** NMT 1.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{17}H_{18}FN_3O_3$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Ciprofloxacin Hydrochloride RS in the *Standard solution* (mg/mL), calculated on the anhydrous basis

$C_U$  = nominal concentration of ciprofloxacin in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of ciprofloxacin, 331.34

$M_{r2}$  = molecular weight of anhydrous ciprofloxacin hydrochloride, 367.81

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>**

**Medium:** 0.01 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

**Standard solution:** USP Ciprofloxacin Hydrochloride RS in *Medium*

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** 276 nm

**Analysis**

**Samples:** *Sample solution* and *Standard solution*

**Tolerances:** An amount of ciprofloxacin hydrochloride ( $C_{17}H_{18}FN_3O_3 \cdot HCl$ ) equivalent to NLT 80% (Q) of the labeled amount of ciprofloxacin ( $C_{17}H_{18}FN_3O_3$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS <11>**

USP Ciprofloxacin Ethylenediamine Analog RS

1-Cyclopropyl-6-fluoro-1,4-dihydro-4-oxo-7-[(2-aminoethyl)amino]-3-quinolinecarboxylic acid hydrochloride.

$C_{15}H_{16}FN_3O_3 \cdot HCl$  341.77

USP Ciprofloxacin Hydrochloride RS

**Cisapride**

$C_{23}H_{29}ClFN_3O_4$  465.95

Benzamide, 4-amino-5-chloro-N-[1-[3-(4-fluorophenoxy)propyl]-3-methoxy-4-piperidinyl]-2-methoxy-, *cis-cis*-4-Amino-5-chloro-N-[1-[3-(p-fluorophenoxy)propyl]-3-methoxy-4-piperidinyl]-o-anisamide [81098-60-4].

Monohydrate 484.0 [260779-88-2].

» Cisapride contains not less than 99.0 percent and not more than 101.0 percent of  $C_{23}H_{29}ClFN_3O_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers, and store at room temperature.

**USP Reference standards <11>**

USP Cisapride RS

USP Haloperidol RS

**Completeness of solution <641>**—A solution, 10 mg per mL in methylene chloride, meets the requirements.

**Identification, Infrared Absorption <197K>.**

**Specific rotation <781S>:** between  $-10^\circ$  and  $+10^\circ$ , measured at  $20^\circ$ .

*Test solution:* 10 mg per mL, in methylene chloride.

**Water, Method I <921>:** between 3.4% and 4.0%.

**Residue on ignition <281>:** not more than 0.1%.

**Chromatographic purity**

*Solution A*—Prepare a 20 g per L solution of tetrabutylammonium hydrogen sulfate in water.

*Solution B*—Use methanol.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Blank solution**—Use methanol.

**System suitability solution**—Prepare a solution of USP Cisapride RS and USP Haloperidol RS in methanol containing about 0.05 mg per mL and 0.4 mg per mL, respectively.

**Test solution 1**—Dissolve an accurately weighed quantity of Cisapride, in methanol to obtain a solution having a known concentration of about 10 mg per mL.

**Test solution 2**—Dilute quantitatively and stepwise *Test solution 1* in methanol to obtain a solution having a known concentration of about 0.05 mg per mL.

**Chromatographic system** (see *Chromatography* <621>).—The liquid chromatograph is equipped with a 275-nm detector and a 4.0-mm × 10-cm column that contains 3-μm base-deactivated packing L1. The flow rate is about 1.2 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–20	80→55	20→45	linear gradient
20–21	55→5	45→95	linear gradient
21–25	5	95	isocratic
25–26	5→80	95→20	return to initial conditions
26–30	80	20	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the order of elution is cisapride followed by haloperidol, the resolution,  $R$ , between these two peaks is not less than 2.5; and the relative standard deviation for replicate injections is not more than 2.0% for the cisapride peak.

**Procedure**—Inject a volume (about 10 μL) of the *Blank solution*, *Test solution 1*, and *Test solution 2* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of cisapride impurities in the portion of Cisapride taken by the formula:

$$100(C_s / C_i)(r_i / r_s)$$

in which  $C_s$  and  $C_i$  are the concentration of cisapride, in mg per mL, of *Test solution 2* and *Test solution 1*, respectively;  $r_i$  is the individual peak response of cisapride impurities in *Test solution 1*; and  $r_s$  is cisapride peak area in *Test solution 2*: not more than 0.5% of any cisapride impurity is found, and not more than 1.0% of total impurities is found. Disregard any peak also found in the *Blank solution* and any peak with an area less than 0.1 times the area of the principal peak in the *Test solution 2* chromatogram.

**Assay**—Dissolve about 0.350 g of Cisapride, accurately weighed, in 70 mL of a mixture of methyl ethyl ketone and acetic acid (7:1). Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each mL of 0.1 N perchloric acid is equivalent to 46.60 mg of  $C_{23}H_{29}ClFN_3O_4$ .

## Cisplatin

$Cl_2H_6N_2Pt$  300.05

Platinum, diamminedichloro-, (SP-4-2)-  
cis-Diamminedichloroplatinum [15663-27-1].

» Cisplatin contains not less than 98.0 percent and not more than 102.0 percent of  $Cl_2H_6N_2Pt$ , calculated on the anhydrous basis.

**Caution**—Cisplatin is potentially cytotoxic. Great care should be taken to prevent inhaling particles and exposing the skin to it.

**Packaging and storage**—Preserve in tight containers. Protect from light.

**USP Reference standards** <11>—

USP Cisplatin RS

USP Transplatin RS

USP Potassium Trichloroammineplatinate RS

$Cl_3H_3KNPt$  357.58

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**B:** *Infrared Absorption* <197K>.

**C:** *Spray reagent*—Add 5.6 g of stannous chloride to 10 mL of hydrochloric acid, and stir for 5 minutes. [NOTE—It is not necessary that all of the solids dissolve.] Dissolve 0.2 g of potassium iodide in 90 mL of water. Mix the two solutions together. Disregard any precipitate that is formed. Store in the dark. The solution is usable for at least 1 week.

**Procedure**—Prepare a test solution containing 1 mg of Cisplatin per mL and a Standard solution containing 1 mg of USP Cisplatin RS per mL, both in dimethylformamide. Apply separately 5-μL quantities of each solution to a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* <621>). Place the plate in a suitable chromatographic chamber containing a filter paper lining and equilibrated for 30 minutes with a developer consisting of a mixture of acetone and 1 N nitric acid (180:20). Develop the plate for a distance of about 8 cm from the origin. Remove the plate, and allow it to air-dry. Complete the drying by heating in a forced-air oven at about 100° for 1 minute. Spray the plate with *Spray reagent*, heat it in an oven at about 100° for 5 minutes, cool, and spray with a 1 in 50 solution of potassium iodide in water, to bring out the full color of the spots: the principal spot from the test solution corresponds in appearance and  $R_f$  value to that produced by the Standard solution.

**Crystallinity** <695>: meets the requirements.

**Water, Method I** <921>: not more than 1.0%.

**UV purity ratio**—[NOTE—Cleanse all glassware with a mixture of hydrochloric acid and nitric acid (3:1), rinse thoroughly with water, and dry before use. Do not use dichromate for cleaning. Do not use acetone or pressurized air for drying. Protect the test solution from light, and use within 1 hour after its preparation.] Transfer  $98.5 \pm 0.5$  mg of ground Cisplatin to a 100-mL volumetric flask, and add 0.1 N hydrochloric acid to volume. Using a clean magnetic stir bar, alternately stir at a high speed for 5 minutes and sonicate for 10 seconds until complete solution is effected, inverting the flask frequently to remove particles that may cling to the neck. Obtain the UV absorption spectrum, using thoroughly rinsed 2-cm cells, with 0.1 N hydrochloric acid in the reference cell: the ratio of the absorbance at the maximum near 301 nm to that at the minimum near 246 nm is not less than 4.5.

**Limit of trichloroammineplatinate**—

**Mobile phase**—Transfer 0.8 g of ammonium sulfate to a 2-liter volumetric flask, dissolve in water, and dilute with water to volume. Degas, and filter through a membrane filter prior to use. The pH of this solution is  $5.9 \pm 0.1$ . Make adjustments to the ionic strength of the *Mobile phase*, if necessary, to meet the system suitability requirements.

**Standard preparation**—[NOTE—Use low-actinic glassware.] Dissolve a suitable quantity of USP Potassium Trichloroammineplatinate RS, accurately weighed, in saline TS, and dilute quantitatively with saline TS to obtain a solution having

a known concentration of about 6 µg per mL. Use within 4 hours.

**Test preparation**—[NOTE—Use low-actinic glassware.] Transfer about 50 mg of Cisplatin, accurately weighed, to a 100-mL volumetric flask, and dilute with saline TS to volume. Completely dissolve by stirring by mechanical means for 30 minutes. Use within 4 hours.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 209-nm detector and a 4.6-mm × 25-cm column that contains packing L14. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the resolution,  $R$ , between the saline TS peak and the trichloroamineplatininate peak is not less than 2.0, and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the areas for the peaks due to trichloroamineplatininate. The relative retention times are about 1.0 for cisplatin (in the void volume) and 5.0 for trichloroamineplatininate. Calculate the percentage of trichloroamineplatininate taken by the formula:

$$10(318.48 / 357.58)(r_U / r_S)(C / W)$$

in which 318.48 and 357.58 are the formula weights of trichloroamineplatininate and potassium trichloroamineplatininate, respectively;  $r_U$  and  $r_S$  are the peak areas obtained from the *Test preparation* and the *Standard preparation*, respectively;  $C$  is the concentration, in µg per mL, of the *Standard preparation*; and  $W$  is the weight, in mg, of Cisplatin taken: not more than 1.0% is found.

#### Limit of transplatin—

**Mobile phase**—Prepare a 0.18 M solution in water of monobasic potassium phosphate. Adjust with phosphoric acid to a pH of 3.2, and filter.

**Stock standard solution**—Transfer about 10 mg of USP Transplatin RS, accurately weighed, to a 200-mL volumetric flask, dilute with saline TS to volume, and dissolve by stirring by mechanical means for 30 minutes.

**Working standard solution**—Pipet 5 mL of *Stock standard solution* into a 25-mL volumetric flask containing about 12 mg of USP Cisplatin RS. Dilute with saline TS to volume, and stir by mechanical means for 30 minutes to dissolve.

**Standard preparation**—Pipet 10 mL of *Working standard solution* into a 50-mL volumetric flask. Add 5.0 mL of a 1 in 200 solution of thiourea, prepared fresh daily, and 5.0 mL of 1 N hydrochloric acid. Dilute with saline TS to volume, and mix. Place about 10 mL of this solution in a suitable serum vial, seal with a polytef-lined closure, and heat in a heating block at 60 ± 0.5° for 60 minutes. Remove, and cool to room temperature.

**Test solution**—Transfer about 50 mg of Cisplatin, accurately weighed, to a 100-mL volumetric flask, dilute with saline TS to volume, and dissolve by stirring by mechanical means for 30 minutes.

**Test preparation**—Pipet 10 mL of *Test solution* into a 50-mL volumetric flask, and proceed as directed for *Standard preparation*, beginning with "add 5.0 mL of a 1 in 200 solution of thiourea."

**Resolution solution**—Place about 10 mg of USP Cisplatin RS in a 200-mL volumetric flask, dilute with saline TS to volume, and stir by mechanical means for 30 minutes to dissolve. Pipet 10 mL of this solution and 10 mL of *Stock standard solution* into a 50-mL volumetric flask, and proceed as directed for *Standard preparation*, beginning with "add 5.0 mL of a 1 in 200 solution of thiourea."

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L9.

The column is maintained throughout at a temperature of 45°. The flow rate is about 2.0 mL per minute. Condition the column by pumping *Mobile phase* at a flow rate of 2.0 mL per minute for 30 minutes, then at 0.5 mL per minute for 30 minutes, and then again at 2.0 mL per minute for 30 minutes. Chromatograph the *Standard preparation*. The retention time of the derivatized transplatin is between 5.0 and 9.0 minutes; or, if it is not, modify the *Mobile phase* as necessary, and recondition the column. The column efficiency,  $n$ , is not less than 2500. Chromatograph the *Resolution solution*. The resolution,  $R$ , is not less than 1.7. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 4.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Test preparation* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the areas of the transplatin peaks. The relative retention times are about 1.0 for cisplatin and 1.3 for transplatin. Calculate the percentage of transplatin taken by the formula:

$$10(C / W)(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Transplatin RS in the *Working standard solution*;  $W$  is the weight, in mg, of Cisplatin taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Test preparation* and the *Standard preparation*, respectively. Not more than 2.0% is found.

**Platinum content**—[NOTE—Thoroughly cleanse all glassware with nitric acid, and rinse with *Purified Water*, to prevent "mirroring" of the platinum precipitate.] Transfer about 0.5 g of Cisplatin, accurately weighed, to a 600-mL beaker. Add 300 mL of 0.1 N hydrochloric acid, and slowly dissolve by heating nearly to boiling on a hot plate covered with an insulating pad, and stirring frequently with a glass stirring rod. When solution is complete, remove the insulating pad, and boil for about 10 minutes. Remove the beaker from the hot plate, allow to cool for 1 minute without stirring, and filter through quantitative, fine-porosity, smooth, dense, ashless filter paper, collecting the filtrate in a 600-mL beaker, completing the transfer to the filter with hot water. Wash the filter with hot water. Place the beaker containing the combined filtrate and washings on a hot plate, and evaporate to a volume of about 300 mL. Place a glass stirring rod in the beaker, and heat the solution to boiling. Slowly add to the center of the beaker, by dropwise additions, 10.0 mL of hydrazine hydrate, 85%. [Caution—Hydrazine is toxic.] Add 2 drops of 10 N sodium hydroxide, boil for 10 minutes to coagulate the precipitate for ease of filtration, cool, and filter through quantitative, medium-porosity, smooth, ashless filter paper. Rinse the beaker with hot water, and pour the rinsings onto the filter. Wipe the beaker and the stirring rod with small pieces of the same kind of paper used for this filtration, and place these and the filter containing the precipitate in a No. 1 porcelain crucible, previously ignited to constant weight. Dry on a hot plate covered with an insulating pad, slowly increase the heat to char, and ignite for 1 hour at 800°. Cool in a desiccator, and again weigh: the weight of the platinum so obtained is between 64.42% and 65.22% of the weight of Cisplatin taken, on the anhydrous basis.

#### Assay—

**Mobile phase**—Prepare a suitable solution by mixing ethyl acetate, methanol, dimethylformamide, and degassed water (25:16:5:5), and degas.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cisplatin RS quantitatively in dimethylformamide to obtain a solution having a known concentration of about 1 mg per mL. Use within 1 hour.

**Assay preparation**—Dissolve about 100 mg of Cisplatin, accurately weighed, in dimethylformamide in a 100-mL vol-

umetric flask, dilute with dimethylformamide to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 310-nm detector and a 4.0-mm × 30-cm column that contains packing L8. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak response as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 40 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $\text{Cl}_2\text{H}_6\text{N}_2\text{Pt}$  in the portion of Cisplatin taken by the formula:

$$100C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Cisplatin RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cisplatin for Injection

» Cisplatin for Injection is a sterile, lyophilized mixture of Cisplatin, Mannitol, and Sodium Chloride. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cisplatin ( $\text{Cl}_2\text{H}_6\text{N}_2\text{Pt}$ ).

**Caution**—Cisplatin is potentially cytotoxic. Great care should be taken in handling the powder and preparing solutions.

**Packaging and storage**—Preserve in Containers for Sterile Solids as described under *Injections* <1>. Protect from light.

**USP Reference standards** <11>—

USP Cisplatin RS

USP Endotoxin RS

USP Transplatin RS

USP Potassium Trichloroamineplatinate RS

$\text{Cl}_3\text{H}_3\text{KNPt}$  357.58

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Identification**—

**Spray reagent**—Prepare as directed for *Spray reagent* in *Identification* test C under *Cisplatin*.

**Standard preparation**—Prepare a solution containing 1.0 mg of USP Cisplatin RS per mL, 9 mg of sodium chloride per mL, and 10 mg of D-mannitol per mL, in water.

**Test preparation**—Dissolve the contents of 1 container in water to provide a Cisplatin concentration of 1.0 mg per mL, based on label claim.

**Procedure**—Proceed as directed for *Procedure* in *Identification* test C under *Cisplatin*, beginning with “Apply separately 5-µL quantities.” The principal spot from the *Test preparation* corresponds in appearance and  $R_f$  value to that from the *Standard preparation*.

**Bacterial endotoxins** <85>—It contains not more than 2.0 USP Endotoxin Units per mg of cisplatin.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Uniformity of dosage units** <905>: meets the requirements.

**pH** <791>: between 3.5 and 6.2, in the solution constituted as directed in the labeling, using Sterile Water for Injection.

**Water, Method I** <921>—Use anhydrous formamide as the extraction solvent, and use the following procedure. Introduce about 50 mL of anhydrous formamide into the titration vessel, and titrate with the *Reagent* to the electrometric endpoint. Use the formamide thus dried to rinse a suitable glass syringe equipped with a 22-gauge needle, about 8 cm long. Add the rinse back to the titration vessel, and again titrate the vessel contents, if necessary. Via the syringe, withdraw 5 mL of the formamide thus titrated, and, through the closure of the container, expel the contents into the container. Shake the container to obtain a solution. With the same syringe, withdraw all of the contents of the container, and transfer to the titration vessel. Titrate to the endpoint, adjusting the feeding speed control to the lowest setting, to avoid over-titration. The amount of water found is not more than 2.0%.

**Limit of trichloroamineplatinate**—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the test for *Limit of trichloroamineplatinate* under *Cisplatin*.

**Test preparation**—Using low-actinic volumetric glassware, quantitatively dissolve with water the contents of 1 container to yield a 0.5 mg per mL solution of Cisplatin.

**Procedure**—Proceed as directed for *Procedure* in the test for *Limit of trichloroamineplatinate* under *Cisplatin*. Calculate the percentage of trichloroamineplatinate taken by the formula:

$$0.1(318.48/357.58)(r_u / r_s)(CV/W)$$

in which 318.48 and 357.58 are the formula weights of trichloroamineplatinate and potassium trichloroamineplatinate, respectively;  $r_u$  and  $r_s$  are the peak areas obtained from the *Test preparation* and the *Standard preparation*, respectively; *C* is the concentration, in µg per mL, of the *Standard preparation*; *V* is the volume, in mL, of the constituted container contents; and *W* is the labeled amount, in mg, of Cisplatin per container. Not more than 1.0% is found.

**Limit of transplatin**—

**Mobile phase, Stock standard solution, Working standard solution, Standard preparation, Resolution solution, and Chromatographic system**—Proceed as directed in the test for *Limit of transplatin* under *Cisplatin*.

**Test solution**—Quantitatively dissolve the contents of 1 container with water to yield a 0.5 mg per mL solution of Cisplatin.

**Test preparation**—Prepare as directed for *Test preparation* in the test for *Transplatin* under *Cisplatin*.

**Procedure**—Proceed as directed for *Procedure* in the test for *Limit of transplatin* under *Cisplatin*. Calculate the percentage of transplatin taken by the formula:

$$0.1(CV/W)(r_u / r_s)$$

in which *C* is the concentration, in µg per mL, of the *Standard preparation*; *V* is the volume, in mL, of the constituted container contents; *W* is the labeled amount, in mg, of Cisplatin per container; and  $r_u$  and  $r_s$  are the peak areas obtained from the *Test preparation* and the *Standard preparation*, respectively. Not more than 2.0% is found.

**Other requirements**—It meets the requirements for *Labeling* under *Injections* <1>.

**Assay**—

**Mobile phase, Standard preparation, and Chromatographic system**—Proceed as directed in the *Assay* under *Cisplatin*.

**Assay preparation**—Quantitatively dissolve the Cisplatin in 1 container by sonicating for 5 minutes with dimethylformamide to yield a Cisplatin concentration of about 1.0 mg

per mL. Filter 5 mL through a suitable membrane filter, and collect the filtrate after discarding the first mL passing through the filter.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Cisplatin*. Calculate the quantity, in mg, of  $\text{C}_{20}\text{H}_{21}\text{FN}_2\text{O}$  in the container taken by the formula:

$$CV(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cisplatin RS in the *Standard preparation*; V is the volume, in mL, of the constituted container contents; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Citalopram Hydrobromide

$\text{C}_{20}\text{H}_{21}\text{FN}_2\text{O} \cdot \text{HBr}$  405.30

5-Isobenzofurancarbonitrile, 1-[3-(dimethylamino)propyl]-1-(4-fluorophenyl)-1,3-dihydro-, monohydrobromide.

1-[3-(Dimethylamino)propyl]-1-(p-fluorophenyl)-5-phthalanocarbonitrile monohydrobromide [59729-32-7].

» Citalopram Hydrobromide contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{20}\text{H}_{21}\text{FN}_2\text{O} \cdot \text{HBr}$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.

**Labeling**—If a test for *Related compounds* other than *Test 1* is used, then the labeling states with which *Related compounds* test the article complies.

### USP Reference standards (11)—

USP Citalopram Hydrobromide RS

USP Citalopram Related Compound A RS

1-(3-Dimethylaminopropyl)-1-(4'-fluorophenyl)-1,3-dihydroisobenzofuran-5-carboxamide.

$\text{C}_{20}\text{H}_{23}\text{FN}_2\text{O}_2$  342.22

USP Citalopram Related Compound C RS

3-[3-(Dimethylamino)-1-propyl]-(4-fluorophenyl)-6-cyano-1(3H)-isobenzofuranone.

$\text{C}_{20}\text{H}_{19}\text{FN}_2\text{O}_2$  338.22

USP Citalopram Related Compound D RS

1-(4-Fluorophenyl)-1-(3-(methylamino)propyl)-1,3-dihydroisobenzofuran-5-carbonitrile hydrochloride.

$\text{C}_{19}\text{H}_{19}\text{FN}_2\text{O} \cdot \text{HCl}$  346.83

USP Citalopram Related Compound G RS

1-(4'-Fluorophenyl)-1-(3-dimethylaminopropyl)-5-chlorophthalane hydrobromide.

$\text{C}_{19}\text{H}_{21}\text{FNOCl} \cdot \text{HBr}$  414.74

USP Citalopram Related Compound H RS

1-(4'-Fluorophenyl)-1-(3-dimethylaminopropyl)-5-bromophthalane hydrobromide.

$\text{C}_{19}\text{H}_{21}\text{FNOBr} \cdot \text{HBr}$  459.1

**Completeness of solution**—The absorbance at 410 nm of a 2.5% w/v solution, in 96% alcohol, against a sample solvent in a 1-cm quartz cell is not more than 0.040.

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the

chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** A solution of 10 mg per mL meets the requirement of the silver nitrate precipitate test for *Bromide* (191).

**Specific rotation** (781S): between  $-0.2^\circ$  and  $+0.2^\circ$  at  $20^\circ$ .

**Test solution:** 25 mg per mL, in methanol.

**pH** (791): between 5.5 and 6.5, in a solution (0.5 in 100).

**Water, Method I** (921): not more than 0.5%, using about 250 mg of sample.

**Residue on ignition** (281): not more than 0.1%. The sample is moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Heavy metals, Method II** (231): 0.002%.

### Related compounds—

**NOTE**—On the basis of the synthetic route used, perform either *Test 1* or *Test 2*. However, if the chloro and bromo analogs are potential related compounds in the synthetic route used, *Test 2* is recommended.

#### TEST 1—

**Buffer, Mobile phase, Diluent, and Chromatographic system**—Proceed as directed in the *Assay*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Use the *Standard preparation*, prepared as directed in the *Assay*.

**Working standard solution**—Dilute the *Standard solution* with *Diluent*, quantitatively and stepwise if necessary, to obtain a solution having a concentration of 0.625  $\mu\text{g}$  per mL of citalopram hydrobromide.

**System suitability solution**—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS and USP Citalopram Related Compound D RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.001 mg per mL.

**Sensitivity solution**—Dilute 5.0 mL of the *Working standard solution* with *Diluent* to 50 mL to obtain a solution having 0.0625  $\mu\text{g}$  of citalopram hydrobromide per mL.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—Inject the *Diluent* as directed for *Procedure* to verify that there are no interfering peaks. Chromatograph the *Sensitivity solution*, and record the peak responses as directed for *Procedure*: the signal-to-noise ratio is at least 3. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between citalopram related compound D and citalopram is not less than 1.8; the tailing factor for the citalopram hydrobromide peak is not less than 0.8 and not more than 1.5; and the relative standard deviation for replicate injections, based on the citalopram peak, is not more than 5%.

**NOTE**—For the purpose of identification, the approximate relative retention times are 0.90 for citalopram related compound D and 1.0 for citalopram hydrobromide.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms for about 40 minutes, and measure the responses for the major peaks. Calculate the percentage of related compounds in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_S / C_T)(r_i / r_S)(324.39/405.30)(1/F)$$

in which  $C_S$  and  $C_T$  are the concentrations, in mg per mL, of Citalopram Hydrobromide in the *Working standard solution* and the *Test solution*, respectively;  $r_i$  is the peak response for each impurity obtained from the *Test solution*;  $r_S$  is the peak response for the citalopram peak, obtained from the *Working standard solution*; 324.39 and 405.30 are the molecular

Table 1

Related Compound	Relative Retention Time	Relative Response Factor ( <i>F</i> )	Limit (%)
1-(3-Dimethylaminopropyl)-1-(4'-fluorophenyl)-5-(4-dimethylaminobutyl)-1,3-dihydrobenzofuran	0.13	0.34	NMT* 0.1
Citalopram related compound A	0.18	0.77	NMT 0.1
4-[4-Dimethylamino-1-(4'-fluorophenyl)-1-hydroxy-1-butyl]-3-hydroxymethyl benzonitrile	0.26	0.99	NMT 0.1
Citalopram related compound B	0.40	0.98	NMT 0.1
Citalopram related compound C	0.67	0.69	NMT 0.1
Citalopram related compound D	0.90	1.04	NMT 0.1
Citalopram hydrobromide	1.0	1.0	—
Citalopram related compound E	1.29	0.91	NMT 0.1
Individual unknown impurity	—	1.0	NMT 0.1 each
Total impurities	—	—	NMT 0.5

\*NMT = not more than.

weights for citalopram and citalopram hydrobromide, respectively; and *F* is the relative response factor for each impurity relative to citalopram (free base), as presented in *Table 1*.

#### TEST 2—

**Buffer**—Dissolve about 2.7 g of monobasic potassium phosphate in 1000 mL of water, add 1 mL of *N,N*-dimethyloctylamine, stir, and adjust with phosphoric acid to a pH of 3.0.

**Diluent**—Prepare a mixture of *Buffer* and acetonitrile (70:30).

**Solution A**—Prepare a mixture of *Buffer*, methanol, and tetrahydrofuran (70:24:6).

**Solution B**—Prepare a mixture of acetonitrile and *Buffer* (80:20).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed in *Table 2* for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve accurately weighed quantities of USP Citalopram Hydrobromide RS, USP Citalopram Related Compound A RS, USP Citalopram Related Compound C RS, USP Citalopram Related Compound D RS, USP Citalopram Related Compound G RS, and USP Citalopram Related Compound H RS in *Diluent* to obtain a final solution having a concentration of 1.5 µg per mL of each compound.

**Test solution**—Dissolve an accurately weighed quantity of Citalopram Hydrobromide in a suitable volume of *Diluent* to obtain a solution having a final concentration of 1.5 mg per mL of citalopram hydrobromide.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 224-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 0.8 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–18	100	0	isocratic
18–40	100→10	0→90	linear gradient
40–45	10	90	isocratic
45–46	10→100	90→0	linear gradient
46–55	100	0	re-equilibration

Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the resolution, *R*, between citalopram and citalopram related compound D is not less than 2.0, and that between citalopram related compound G and citalopram related compound H is not less than 4.0; and the relative standard deviation for the

citalopram peak in replicate injections is not more than 2.0%.

NOTE—For the purpose of identification, the approximate relative retention times of citalopram related compounds are provided in *Table 2*.

Table 2

Related Compound	Relative Retention Time	Limit (%)
Citalopram related compound A	0.40	NMT* 0.15
Citalopram related compound C	0.88	NMT 0.15
Citalopram	1.0	—
Citalopram related compound D	1.09	NMT 0.15
Citalopram related compound G	2.20	NMT 0.15
Citalopram related compound H	2.30	NMT 0.15
Individual unspecified impurity	—	NMT 0.1
Total specified and unspecified impurities	—	NMT 0.75

\*NMT = not more than.

**Procedure**—Inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all the peak responses. Calculate the percentage of each citalopram related compound in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which *C<sub>S</sub>* is the concentration, in mg per mL, of each citalopram related compound in the *Standard solution*; *C<sub>T</sub>* is the concentration of citalopram hydrobromide in the *Test solution*; *r<sub>i</sub>* is the peak area of each impurity obtained from the *Test solution*; and *r<sub>S</sub>* is the peak area of each corresponding impurity obtained from the *Standard solution*. Calculate the percentage of each unspecified impurity using the same formula above, but using the concentration, in mg per mL, of citalopram free base in the *Standard solution* for *C<sub>S</sub>* and the response for the citalopram peak obtained from the *Standard solution* for *r<sub>S</sub>*. [NOTE—Disregard the peak due to bromide which may appear at a relative retention time of about 0.24.]

#### Assay—

**Buffer**—In a 1-L volumetric flask, dissolve about 1 g of sodium acetate in 800 mL of water, and add 6 mL of triethylamine. Adjust with acetic acid to a pH of 4.6, and dilute with water to volume.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer* and acetonitrile (80:20). The apparent pH is 5.0 ± 0.1.

Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Diluent**—Prepare a mixture of methanol and water (1:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Citalopram Hydrobromide RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.625 mg per mL.

**Assay preparation**—Transfer about 62.5 mg of Citalopram Hydrobromide, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix to obtain a solution containing 0.625 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 239-nm detector and a 150-mm × 4.6-mm column that contains 5-μm packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at 50°. Inject the *Diluent* to verify that there are no interfering peaks. Inject the *Standard preparation*, and record the peak responses as directed for *Procedure*; the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms for about 30 minutes, and measure the responses for the major peaks. Calculate the quantity, in percentage of C<sub>20</sub>H<sub>21</sub>FN<sub>2</sub>O · HBr, in the portion of Citalopram Hydrobromide taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which  $C_s$  and  $C_u$  are the concentrations, in mg per mL, of the *Standard preparation* and the *Assay preparation*, respectively; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Citalopram Oral Solution

### DEFINITION

Citalopram Oral Solution contains an amount of citalopram hydrobromide equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of citalopram free base (C<sub>20</sub>H<sub>21</sub>FN<sub>2</sub>O). It may contain a suitable preservative.

### IDENTIFICATION

- **PROCEDURE:** The retention time of the citalopram peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Solution A:** Methanol and acetonitrile (1:9)

**Buffer:** 6.1 g/L of monobasic potassium phosphate in water. Add 1.5 mL of triethylamine per L of the solution. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** *Solution A* and *Buffer* (7:18)

**Diluent:** Acetonitrile and *Buffer* (1:3)

**Standard solution:** 0.25 mg/mL of USP Citalopram Hydrobromide RS

**Sample solution:** Transfer a suitable volume of Oral Solution to a suitable volumetric flask to obtain 0.2 mg/mL final concentration of citalopram free base. Add 50% of the flask volume of *Diluent*, and sonicate at room temperature for 3 min with intermittent shaking. Allow the solution to cool, and dilute with *Diluent* to volume. [NOTE—The *Sample solution* may be filtered through either a PVDF or nylon membrane filter of suitable pore size.]

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection size:** 10 μL

**Run time:** 2 times the retention time of citalopram

### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>20</sub>H<sub>21</sub>FN<sub>2</sub>O in the portion of Oral Solution taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times (M_{r1} / M_{r2}) \times 100$$

$r_u$  = peak response of citalopram from the *Sample solution*

$r_s$  = peak response of citalopram from the *Standard solution*

$C_s$  = concentration of USP Citalopram Hydrobromide RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of citalopram in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of citalopram free base, 324.39

$M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

**Acceptance criteria:** 90.0%–110.0% of citalopram free base (C<sub>20</sub>H<sub>21</sub>FN<sub>2</sub>O)

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE

**Solution A:** Acetonitrile, methanol, and tetrahydrofuran (17:1:2)

**Buffer:** Dissolve 3.0 g of 1-octane sulphonic acid sodium salt in 1 L of water. Add 2 mL of triethylamine and 5 mL of tetra-*n*-butyl ammonium hydroxide, 40 percent in water. Mix and adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** *Solution A* and *Buffer* (1:3)

**Diluent:** Acetonitrile and water (1:3)

**System suitability solution:** 6 μg/mL of USP Citalopram Related Compound D RS and 1.3 mg/mL of USP Citalopram Hydrobromide RS in *Diluent*

**Standard solution:** 6.3 μg/mL of USP Citalopram Hydrobromide RS in *Diluent*

**Sample solution:** Transfer a suitable volume of the Oral Solution to a suitable volumetric flask to obtain 1 mg/mL final concentration of citalopram. Add 60% of the flask volume of *Diluent*, and sonicate at room temperature for 3 min with intermittent shaking. Allow the solution to cool, and dilute with *Diluent* to volume. [NOTE—The *Sample solution* may be filtered through either a PVDF or nylon membrane filter of suitable pore size.]

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 225 nm

**Column:** 4.6-mm × 15-cm; 5-μm packing L1

**Flow rate:** 1.5 mL

**Injection size:** 20 μL

**Run time:** 2.6 times the retention time of citalopram for the *System suitability solution* and *Standard solution*; 5.7 times the retention time of citalopram for the *Sample solution*

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.8 between citalopram and citalopram related compound D, *System suitability solution*

**Tailing factor:** NMT 2.0, *Standard solution*

**Relative standard deviation:** NMT 5.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of any individual impurity in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of each individual impurity from the *Sample solution*

$r_S$  = peak response of citalopram from the *Standard solution*

$C_S$  = concentration of USP Citalopram Hydrobromide RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of citalopram in the *Sample solution* (mg/mL)

$F$  = relative response factor for each impurity as listed in *Impurity Table 1*

$M_{r1}$  = molecular weight of citalopram free base, 324.39

$M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

**Acceptance criteria**

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 0.50%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Citalopram related compound A <sup>a</sup>	0.29	0.86	0.20

<sup>f</sup> 1-(4-Fluorophenyl)-1-(3-dimethylaminopropyl)-5-chlorophthalane hydrobromide.

<sup>g</sup> 1-(4-Fluorophenyl)-1-(3-dimethylaminopropyl)-5-bromophthalane hydrobromide.

<sup>h</sup> This process impurity is listed for information only.

**SPECIFIC TESTS**

• **DELIVERABLE VOLUME** <698>: Meets the requirements

• **PH** <791>: 3.5–7.0

• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed 100 cfu/mL. The total yeasts and molds count does not exceed 50 cfu/mL. It meets the requirements of the test for absence of *Escherichia coli*.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in light-resistant containers at controlled room temperature.

• **USP REFERENCE STANDARDS** <11>

USP Citalopram Hydrobromide RS

USP Citalopram Related Compound D RS

1-(4-Fluorophenyl)-1-(3-methylaminopropyl)-1,3-dihydroisobenzofuran-5-carbonitrile hydrochloride

C<sub>19</sub>H<sub>19</sub>FN<sub>2</sub>O · HCl 346.83

**Citalopram Tablets****DEFINITION**

Citalopram Tablets contain an amount of Citalopram Hydrobromide equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of citalopram free base (C<sub>20</sub>H<sub>21</sub>FN<sub>2</sub>O).

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** <197K>

**Sample:** Extract finely ground Tablet powder containing 200 mg of citalopram with 30 mL of water, and filter. Add 1 mL of 1 N sodium hydroxide to the filtrate, and extract with 50 mL of cyclohexane by shaking for 10 min. Pass the cyclohexane layer through a silicone-treated filter paper into a beaker. Reduce the filtrate down to 3 mL, using gentle heat as necessary. Transfer the hot solution to a small centrifuge tube. Induce crystallization while cooling by scratching the side of the test tube with a spatula. Centrifuge the mixture, and decant off the cyclohexane. Dry the residue under vacuum in a desiccator. [NOTE—If crystallization fails to occur in the above procedure, use the following alternative procedure. Extract finely ground Tablet powder containing about 50 mg of citalopram with 10 mL of

chloroform in a test tube, and sonicate for 1 min. Centrifuge for 10 min, and filter into a beaker. Evaporate to dryness with nitrogen and if necessary induce crystallization by etching the beaker.]

Mix approximately 2 mg of the residue with approximately 300 mg of potassium bromide, and record the IR spectrum.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### • PROCEDURE

**Buffer:** 1.42 g/L of anhydrous dibasic sodium phosphate in water

**Diluent:** Methanol and *Buffer* (80:20)

**Mobile phase:** 0.77 mg/mL of dodecyltrimethylammonium bromide in *Diluent*

**Internal standard solution:** 0.25 mg/mL of USP

Citalopram Related Compound F RS in *Diluent*

**Standard stock solution:** 1.25 mg/mL of USP

Citalopram Hydrobromide RS in *Diluent*

**Standard solution:** 0.025 mg/mL of USP Citalopram Related Compound F RS and 0.125 mg/mL of USP

Citalopram Hydrobromide RS from the *Internal standard solution* and the *Standard stock solution*, respectively, in *Diluent*

**Sample solution:** Transfer 10 Tablets to a 200-mL volumetric flask, add 25 mL of *Buffer*, and shake by mechanical means until disintegrated. Add 100 mL of methanol, and sonicate for about 5 min. Allow to cool to room temperature, then dilute with *Diluent* to volume. Allow to stand until the residue settles before taking an aliquot for dilution. Transfer a volume of the clear supernatant to a 50-mL volumetric flask to obtain a final nominal concentration between 0.090 mg/mL and 0.10 mg/mL of citalopram. Add 5.0 mL of *Internal standard solution*, and dilute with *Diluent* to volume. Pass a portion through a filter (PTFE) having a 0.45-μm or finer pore size.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Column temperature:** 45°

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for citalopram related compound F and citalopram are about 1.36 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 1.5 between citalopram and citalopram related compound F

**Column efficiency:** NLT 2000 theoretical plates, calculated from the citalopram peak

**Relative standard deviation:** NMT 1.5% for the citalopram peak

### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the label claim of citalopram in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$R_U$  = ratio of the peak response of citalopram to the internal standard from the *Sample solution*

$R_S$  = ratio of the peak response of citalopram to the internal standard from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of citalopram, 324.39

$M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

**Buffer solution:** pH 1.5 buffer (prepared by transferring 118 mL of 1 N hydrochloric acid and 82 mL of 1 N sodium hydroxide to a 1000-mL volumetric flask, diluting with water to volume, and adjusting with 1 N sodium hydroxide to a pH of 1.5)

**Medium:** *Buffer solution*; 800 mL, deaerated

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Detector:** UV at about 239 nm

**Sample solution:** Sample per *Dissolution* <711>. Pass through a PVDF filter having a 0.45-μm pore size, and dilute with *Medium* as needed.

**Standard solution:** 12 μg/mL of USP Citalopram Hydrobromide RS in *Medium*

**Analysis:** Calculate the percentage of citalopram dissolved:

$$\text{Result} = (A_U/A_S) \times C_S \times D \times V \times (M_{r1}/M_{r2}) \times (100/L)$$

$A_U$  = absorbance from the *Sample solution*

$A_S$  = absorbance from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$D$  = dilution factor of the *Sample solution*

$V$  = volume of *Medium* (800 mL)

$M_{r1}$  = molecular weight of citalopram, 324.39

$M_{r2}$  = molecular weight of citalopram hydrobromide, 405.30

$L$  = Tablet label claim of citalopram (mg)

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{20}H_{21}FN_2O$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

## IMPURITIES

### Organic Impurities

### • PROCEDURE

**Buffer:** 3.15 g/L of potassium dihydrogen phosphate and 3.60 g/L of disodium hydrogen phosphate ( $Na_2HPO_4 \cdot 12H_2O$ ) in water

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (38:7:55). Adjust with phosphoric acid to a pH of 6.5.

**Standard stock solution:** 0.25 mg/mL of USP

Citalopram Hydrobromide RS in *Mobile phase*

**System suitability solution:** 1 μg/mL each of USP Citalopram Related Compound A RS, USP Citalopram Related Compound B RS, USP Citalopram Related Compound C RS, and USP Citalopram Related Compound E RS, in *Standard stock solution*

**Standard solution:** 0.625 μg/mL of citalopram hydrobromide from *Standard stock solution* in *Mobile phase*

**Sensitivity solution:** 0.05 μg/mL of citalopram hydrobromide from *Standard solution* in *Mobile phase*

**Sample solution:** Transfer 10 Tablets to a 200-mL volumetric flask, add 25 mL of *Buffer*, and shake by mechanical means until disintegrated. Add 100 mL of a mixture of methanol and water (1:1), mix, and sonicate for about 5 min. Allow to cool, dilute with a mixture of methanol and water (1:1) to volume, and mix thoroughly. Allow the excipients to settle. Dilute with *Mobile phase* as necessary to obtain a final concentration of 0.5 mg/mL of citalopram. Pass a portion of this solution through a polytetrafluoroethylene (PTFE) membrane filter having a 0.45-μm or finer pore size, and use the filtrate.

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 239 nm**Column:** 4.6-mm × 15-cm; 5-μm packing L1**Column temperature:** 45°**Flow rate:** 0.8 mL/min**Injection size:** 20 μL**System suitability****Samples:** *System suitability solution*, *Standard solution*, and *Sensitivity solution*[NOTE—The relative retention times are given in *Impurity Table 1*.]**Suitability requirements****Resolution:** NLT 3 between citalopram related compound C and citalopram, *System suitability solution***Tailing factor:** NMT 1.5, *Standard solution***Relative standard deviation:** NMT 5%, *Standard solution***Signal-to-noise ratio:** NLT 3, *Sensitivity solution***Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in each Tablet taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times (1/F) \times 100$$

- $r_U$  = peak response for each citalopram related compound from the *Sample solution*  
 $r_S$  = peak response of the corresponding peak in the *Standard solution*  
 $C_S$  = concentration of citalopram hydrobromide in the *Standard solution* (mg/mL)

- SULFATE**

**Standard sulfate solution A:** 1.81 mg/mL of potassium sulfate in 30% alcohol. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with 30% alcohol to volume, and mix. This solution contains 10 μg/mL of sulfate.**Standard sulfate solution B:** 1.81 mg/mL of potassium sulfate in water. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 10 μg/mL of sulfate.**Sample stock solution:** 66.7 mg/mL of Anhydrous Citric Acid**Sample solution:** To 4.5 mL of *Standard sulfate solution A*, add 3 mL of a barium chloride solution (1 in 4), shake, and allow to stand for 1 min. To 2.5 mL of the

resulting suspension, add 15 mL of the *Sample stock solution* and 0.5 mL of 5 N acetic acid, and mix.

**Standard solution:** Prepare as directed for the *Sample solution*, except use 15 mL of *Standard sulfate solution B* instead of the *Sample stock solution*.

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

**Acceptance criteria:** Any turbidity produced in the *Sample solution* after 5 min standing is not greater than that produced in the *Standard solution* (0.015%).

- **LIMIT OF ALUMINUM** (where it is labeled as intended for use in dialysis)

**Standard aluminum solution:** To 352 mg of aluminum potassium sulfate in a 100-mL volumetric flask, add a few mL of water, swirl to dissolve, add 10 mL of diluted sulfuric acid, dilute with water to volume, and mix. Immediately before use, dilute 1.0 mL of this solution with water to 100.0 mL.

**pH 6.0 acetate buffer:** Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0, dilute with water to 250 mL, and mix.

**Sample solution:** Dissolve 20.0 g of Anhydrous Citric Acid in 100 mL of water, and add 10 mL of pH 6.0 acetate buffer. Extract this solution with successive portions of 20, 20, and 10 mL of a 0.5% solution of 8-hydroxyquinoline in chloroform, combining the chloroform extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume, and mix.

**Standard solution:** Prepare a mixture of 2.0 mL of *Standard aluminum solution*, 10 mL of pH 6.0 acetate buffer, and 98 mL of water. Extract this mixture as described for the *Sample solution*, dilute the combined extracts with chloroform to volume, and mix.

**Blank solution:** Prepare a mixture of 10 mL of pH 6.0 acetate buffer and 100 mL of water. Extract this mixture as described for *Sample solution*, dilute the combined extracts with chloroform to volume, and mix.

#### Fluorometric conditions

**Excitation wavelength:** 392 nm

**Emission wavelength:** 518 nm

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

Determine the fluorescence intensities of the *Samples* in a fluorometer set as directed under *Fluorometric conditions*, using the *Blank solution* to set the instrument to zero.

**Acceptance criteria:** The fluorescence of the *Sample solution* does not exceed that of the *Standard solution* (0.2 ppm).

- **LIMIT OF OXALIC ACID**

**Sample stock solution:** 0.80 g of Anhydrous Citric Acid in 4 mL of water

**Sample solution:** To the *Sample stock solution* add 3 mL of hydrochloric acid and 1 g of granular zinc, boil for 1 min, and allow to stand for 2 min. Transfer the supernatant to a test tube containing 0.25 mL of a phenylhydrazine hydrochloride solution (1 in 100), and heat to boiling. Cool rapidly, transfer to a graduated cylinder, and add an equal volume of hydrochloric acid and 0.25 mL of a potassium ferricyanide solution (1 in 20). Shake, and allow to stand for 30 min.

**Standard solution:** Prepare as directed for the *Sample solution*, except use 4 mL of 0.10 mg/mL oxalic acid solution, equivalent to 0.0714 mg/mL of anhydrous oxalic acid, instead of the *Sample stock solution*. [NOTE—Prepare concomitantly with the *Sample solution*.]

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

**Acceptance criteria:** Any pink color produced in the *Sample solution* is not more intense than that produced in the *Standard solution* (0.036%).

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** The level of bacterial endotoxins is such that the requirement in the relevant

dosage form monograph(s) in which Anhydrous Citric Acid is used can be met. Where the label states that Anhydrous Citric Acid must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Anhydrous Citric Acid is used can be met.♦

#### • CLARITY OF SOLUTION

[NOTE—The *Sample solution* is to be compared to *Standard suspension A* in diffused daylight 5 min after preparation of *Standard suspension A*.]

**Hydrazine sulfate solution:** 10 mg/mL of hydrazine sulfate in water. Allow to stand for 4–6 h before use.

**Methenamine solution:** Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

**Primary opalescent suspension:** Transfer 25.0 mL of *Hydrazine sulfate solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

**Opalescence standard:** Dilute 15.0 mL of *Primary opalescent suspension* with water to 1000 mL. [NOTE—This suspension should not be used beyond 24 h after preparation.]

**Standard suspension A:** Dilute 5.0 mL of *Opalescence standard* with 95 mL of water.

**Standard suspension B:** Dilute 10.0 mL of *Opalescence standard* with 90 mL of water.

**Sample solution:** 200 mg/mL of Anhydrous Citric Acid in water

#### Analysis

**Samples:** *Standard suspension A*, *Standard suspension B*, water, and *Sample solution*

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard suspension A*, *Standard suspension B*, and water to separate matching test tubes. Compare the *Sample solution*, *Standard suspension A*, *Standard suspension B*, and water in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*). [NOTE—The diffusion of light must be such that *Standard suspension A* can readily be distinguished from water, and that *Standard suspension B* can readily be distinguished from *Standard suspension A*.]

**Acceptance criteria:** The *Sample solution* shows the same clarity as that of water or its opalescence is not more pronounced than *Standard suspension A*.

#### • COLOR OF SOLUTION

**Standard stock solution A:** Ferric chloride CS, cobaltous chloride CS, and dilute hydrochloric acid (10 g/L) (2.4: 0.6: 7.0)

**Standard stock solution B:** Ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid (10 g/L) (2.4: 1.0: 0.4: 6.2)

**Standard stock solution C:** Ferric chloride CS, cobaltous chloride CS, and cupric sulfate CS (9.6: 0.2: 0.2) [NOTE—Prepare the *Standard solutions* immediately before use.]

**Standard solution A:** Dilute 2.5 mL of *Standard stock solution A* with dilute hydrochloric acid (10 g/L) to 100 mL.

**Standard solution B:** Dilute 2.5 mL of *Standard stock solution B* with dilute hydrochloric acid (10 g/L) to 100 mL.

**Standard solution C:** Dilute 0.75 mL of *Standard stock solution C* with dilute hydrochloric acid (10 g/L) to 100 mL.

**Sample solution:** Prepare as directed in the test for *Clarity of Solution*.

**Analysis 1****Samples:** Water and *Sample solution*

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer water to a separate matching test tube. Compare the *Sample solution* and water in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

**Acceptance criteria 1:** The *Sample solution* is not more intensely colored than water. If more intensely colored, follow *Analysis 2*.

**Analysis 2****Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Transfer a sufficient portion of *Standard solution A*, *Standard solution B*, and *Standard solution C* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Compare the *Sample solution* from *Analysis 1* to *Standard solution A*, *Standard solution B*, and *Standard solution C* in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

**Acceptance criteria 2:** The *Sample solution* is not more intensely colored than *Standard solutions A*, *B*, and *C*.

**• READILY CARBONIZABLE SUBSTANCES****Sample:** 1.0 g of powdered Anhydrous Citric Acid

**Analysis:** Transfer the *Sample* to a 22-mm × 175-mm test tube previously rinsed with 10 mL of sulfuric acid and allowed to drain for 10 min. Add 10 mL of sulfuric acid, agitate until solution is complete, and immerse in a water bath at 90 ± 1° for 60 ± 0.5 min, keeping the level of the acid below the level of the water during the entire period. Cool the tube in running water, and transfer the acid to a color-comparison tube.

**Acceptance criteria:** The color of the acid is not darker than that of a similar volume of *Matching Fluid K* (see *Color and Achromicity* (631)) in a matching tube, the tubes being observed vertically against a white background.

- **STERILITY TESTS** (71): Where the label states that Anhydrous Citric Acid is sterile, it meets the requirements for *Sterility Tests* (71) in the relevant dosage form monograph(s) in which Anhydrous Citric Acid is used.♦

**• WATER DETERMINATION, Method I** (921)**Sample:** 2.0 g of Anhydrous Citric Acid**Acceptance criteria:** NMT 1.0%**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Where it is intended for use in dialysis solutions, it is so labeled. Where Anhydrous Citric Acid must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Anhydrous Citric Acid is sterile, it is so labeled.
- **USP REFERENCE STANDARDS** (11)  
USP Citric Acid RS  
USP Endotoxin RS.♦

**Citric Acid Monohydrate**

Portions of the monograph text that are national *USP* text, and are not part of the harmonized text, are marked with symbols (♦) to specify this fact.

$C_6H_8O_7 \cdot H_2O$  210.14  
1,2,3-Propanetricarboxylic acid, 2-hydroxy-, monohydrate  
[5949-29-1].

**DEFINITION**

Citric Acid Monohydrate contains one molecule of water of hydration. It contains NLT 99.5% and NMT 100.5% of  $C_6H_8O_7$ , calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K): Dry the substance to be examined at 105° for 2 h.

**ASSAY****• PROCEDURE**

**Sample:** 0.550 g of Citric Acid Monohydrate. Record the weight accurately.

**Analysis:** Dissolve the *Sample* in 50 mL of water, and add 0.5 mL of phenolphthalein TS. Titrate with 1 N sodium hydroxide VS. Each mL of 1 N sodium hydroxide is equivalent to 64.03 mg of  $C_6H_8O_7$ .

**Acceptance criteria:** 99.5%–100.5% on the anhydrous basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%, determined on 1.0 g

- **HEAVY METALS** (231): NMT 10 µg/g.♦

**• SULFATE**

**Standard sulfate solution A:** 1.81 mg/mL of potassium sulfate in 30% alcohol. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with 30% alcohol to volume, and mix. This solution contains 10 µg/mL of sulfate.

**Standard sulfate solution B:** 1.81 mg/mL of potassium sulfate. Immediately before use, transfer 10.0 mL of this solution to a 1000-mL volumetric flask, dilute with water to volume, and mix. This solution contains 10 µg/mL of sulfate.

**Sample stock solution:** 66.7 mg/mL of Citric Acid Monohydrate

**Sample solution:** To 4.5 mL of *Standard sulfate solution A*, add 3 mL of a barium chloride solution (1 in 4), shake, and allow to stand for 1 min. To 2.5 mL of the resulting suspension add 15 mL of the *Sample stock solution* and 0.5 mL of 5 N acetic acid, and mix.

**Standard solution:** Prepare as directed in the *Sample solution*, except use 15 mL of *Standard sulfate solution B* instead of the *Sample stock solution*.

**Analysis****Samples:** *Sample solution* and *Standard solution*

**Acceptance criteria:** Any turbidity produced in the *Sample solution* after 5 min standing is not greater than that produced in the *Standard solution* (0.015%).

- **LIMIT OF ALUMINUM** (where it is labeled as intended for use in dialysis)

**Standard aluminum solution:** To 352 mg of aluminum potassium sulfate in a 100-mL volumetric flask, add a few mL of water, swirl to dissolve, add 10 mL of diluted sulfuric acid, and dilute with water to volume. Immediately before use, dilute 1.0 mL of this solution with water to 100.0 mL.

**pH 6.0 acetate buffer:** Dissolve 50 g of ammonium acetate in 150 mL of water, adjust with glacial acetic acid to a pH of 6.0, dilute with water to 250 mL, and mix.

**Sample solution:** Dissolve 20.0 g of Citric Acid Monohydrate in 100 mL of water, and add 10 mL of pH 6.0 acetate buffer. Extract this solution with successive portions of 20, 20, and 10 mL of a 0.5% solution of 8-hydroxyquinoline in chloroform, combining the chloro-

form extracts in a 50-mL volumetric flask. Dilute the combined extracts with chloroform to volume, and mix.

**Standard solution:** Prepare a mixture of 2.0 mL of *Standard aluminum solution*, 10 mL of pH 6.0 acetate buffer, and 98 mL of water. Extract this mixture as described for the *Sample solution*, dilute the combined extracts with chloroform to volume, and mix.

**Blank solution:** Prepare a mixture of 10 mL of pH 6.0 acetate buffer and 100 mL of water. Extract this mixture as described for the *Sample solution*, dilute the combined extracts with chloroform to volume, and mix.

#### Fluorometric conditions

**Excitation wavelength:** 392 nm

**Emission wavelength:** 518 nm

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

Determine the fluorescence intensities of the *Samples* in a fluorometer set as directed under *Fluorometric conditions*, using the *Blank solution* to set the instrument to zero.

**Acceptance criteria:** The fluorescence of the *Sample solution* does not exceed that of the *Standard solution* (0.2 ppm).

#### • LIMIT OF OXALIC ACID

**Sample stock solution:** 0.80 g of Citric Acid Monohydrate in 4 mL of water

**Sample solution:** To the *Sample stock solution* add 3 mL of hydrochloric acid and 1 g of granular zinc, boil for 1 min, and allow to stand for 2 min. Transfer the supernatant to a test tube containing 0.25 mL of a phenylhydrazine hydrochloride solution (1 in 100), and heat to boiling. Cool rapidly, transfer to a graduated cylinder, and add an equal volume of hydrochloric acid and 0.25 mL of a potassium ferricyanide solution (1 in 20). Shake and allow to stand for 30 min.

**Standard solution:** Prepare as directed for the *Sample solution*, except use 4 mL of 0.10 mg/mL oxalic acid solution, equivalent to 0.0714 mg/mL of anhydrous oxalic acid, instead of the *Sample stock solution*. [NOTE—Prepare concomitantly with the *Sample solution*.]

#### Analysis

**Samples:** *Sample solution* and *Standard solution*

**Acceptance criteria:** Any pink color produced in the *Sample solution* is not more intense than that produced in the *Standard solution* (0.036%).

#### SPECIFIC TESTS

- **BACTERIAL ENDOTOXINS TEST (85):** The level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Citric Acid Monohydrate is used can be met. Where the label states that Citric Acid Monohydrate must be subjected to further processing during the preparation of injectable dosage forms, the level of bacterial endotoxins is such that the requirement in the relevant dosage form monograph(s) in which Citric Acid Monohydrate is used can be met.♦

#### • CLARITY OF SOLUTION

[NOTE—The *Sample solution* is to be compared to *Standard suspension A* in diffused daylight 5 min after preparation of *Standard suspension A*.]

**Hydrazine sulfate solution:** 10 mg/mL of hydrazine sulfate in water. Allow to stand for 4–6 h before use.

**Methenamine solution:** Transfer 2.5 g of methenamine to a 100-mL glass-stoppered flask, add 25.0 mL of water, insert the glass stopper, and mix to dissolve.

**Primary opalescent suspension:** Transfer 25.0 mL of *Hydrazine sulfate solution* to the *Methenamine solution* in the 100-mL glass-stoppered flask. Mix, and allow to stand for 24 h. [NOTE—This suspension is stable for 2 months, provided it is stored in a glass container free from surface defects. The suspension must not adhere to the glass and must be well mixed before use.]

**Opalescence standard:** Dilute 15.0 mL of *Primary opalescent suspension* with water to 1000 mL. [NOTE—This suspension should not be used beyond 24 h after preparation.]

**Standard suspension A:** Dilute 5.0 mL of *Opalescence standard* with 95 mL of water.

**Standard suspension B:** Dilute 10.0 mL of *Opalescence standard* with 90 mL of water.

**Sample solution:** 200 mg/mL of Citric Acid Monohydrate in water

#### Analysis

**Samples:** *Standard suspension A*, *Standard suspension B*, water, and *Sample solution*

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer portions of *Standard suspension A*, *Standard suspension B*, and water to separate matching test tubes. Compare the *Sample solution*, *Standard suspension A*, *Standard suspension B*, and water in diffused daylight, viewing vertically against a black background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*). [NOTE—The diffusion of light must be such that *Standard suspension A* can readily be distinguished from water, and that *Standard suspension B* can readily be distinguished from *Standard suspension A*.]

**Acceptance criteria:** The *Sample solution* shows the same clarity as that of water or its opalescence is not more pronounced than *Standard suspension A*.

#### • COLOR OF SOLUTION

**Standard stock solution A:** Ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid (10 g/L) (2.4: 0.6: 0: 7.0)

**Standard stock solution B:** Ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid (10 g/L) (2.4: 1.0: 0.4: 6.2)

**Standard stock solution C:** Ferric chloride CS, cobaltous chloride CS, cupric sulfate CS, and dilute hydrochloric acid (10 g/L) (9.6: 0.2: 0.2: 0)

[NOTE—Prepare the *Standard solutions* immediately before use.]

**Standard solution A:** Transfer 2.5 mL of *Standard stock solution A*, and dilute with dilute hydrochloric acid (10 g/L) to 100 mL.

**Standard solution B:** Transfer 2.5 mL of *Standard stock solution B*, and dilute with dilute hydrochloric acid (10 g/L) to 100 mL.

**Standard solution C:** Transfer 0.75 mL of *Standard stock solution C*, and dilute with dilute hydrochloric acid (10 g/L) to 100 mL.

**Sample solution:** Prepare as directed in the test for *Clarity of Solution*.

#### Analysis 1

**Samples:** Water and *Sample solution*

Transfer a sufficient portion of the *Sample solution* to a test tube of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Similarly transfer water to a separate matching test tube. Compare the *Sample solution* and water in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

**Acceptance criteria 1:** The *Sample solution* is not more intensely colored than water. If more intensely colored, follow *Analysis 2*.

#### Analysis 2

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, and *Sample solution*

Transfer a sufficient portion of *Standard solution A*, *Standard solution B*, and *Standard solution C* to separate test tubes of colorless, transparent, neutral glass with a flat base and an internal diameter of 15–25 mm to obtain a depth of 40 mm. Compare the *Sample solution* from *Analysis 1* to *Standard solution A*, *Standard solution B*,

and *Standard solution C* in diffused daylight, viewing vertically against a white background (see *Spectrophotometry and Light-Scattering* <851>, *Visual Comparison*).

**Acceptance criteria 2:** The *Sample solution* is not more intensely colored than *Standard solutions A, B, and C*.

• **READILY CARBONIZABLE SUBSTANCES**

**Sample:** 1.0 g powdered Citric Acid Monohydrate

**Analysis:** Transfer the *Sample* to a 22-mm × 175-mm test tube previously rinsed with 10 mL of sulfuric acid and allowed to drain for 10 min. Add 10 mL of sulfuric acid, agitate until solution is complete, and immerse in a water bath at  $90 \pm 1^\circ$  for  $60 \pm 0.5$  min, keeping the level of the acid below the level of the water during the entire period. Cool the tube in running water, and transfer the acid to a color-comparison tube.

**Acceptance criteria:** The color of the acid is not darker than that of a similar volume of *Matching Fluid K* (see *Color and Achromicity* <631>) in a matching tube, the tubes being observed vertically against a white background.

- **STERILITY TESTS** <71>: Where the label states that Citric Acid Monohydrate is sterile, it meets the requirements for *Sterility Tests* <71> in the relevant dosage form monograph(s) in which Citric Acid Monohydrate is used.♦

• **WATER DETERMINATION, Method I** <921>

**Sample:** 0.5 g of Citric Acid Monohydrate

**Acceptance criteria:** 7.5%–9.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. No storage requirements specified.
- **LABELING:** Where it is intended for use in dialysis solutions, it is so labeled. Where Citric Acid Monohydrate must be subjected to further processing during the preparation of injectable dosage forms to ensure acceptable levels of bacterial endotoxins, it is so labeled. Where Citric Acid Monohydrate is sterile, it is so labeled.

USP Citric Acid RS  
USP Endotoxin RS.♦

## Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation

» Citric Acid, Magnesium Oxide, and Sodium Carbonate Irrigation is a sterile solution of Citric Acid, Magnesium Oxide, and Sodium Carbonate in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of citric acid ( $\text{C}_6\text{H}_8\text{O}_7 \cdot \text{H}_2\text{O}$ ), magnesium oxide ( $\text{MgO}$ ), and sodium carbonate ( $\text{Na}_2\text{CO}_3$ ).

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I or Type II glass.

**USP Reference standards** <11>—

USP Citric Acid RS  
USP Endotoxin RS

**Identification**—

**A:** It meets the requirements of the tests for *Sodium* <191> and for *Magnesium* <191>.

**B:** To 10 mL of the Irrigation add 1 mL of mercuric sulfate TS, heat to boiling, and add a few drops of potassium permanganate TS: a white precipitate is formed.

**Bacterial endotoxins** <85>—It contains not more than 2.80 Endotoxin Units per mL.

**pH** <791>: between 3.8 and 4.2.

**Other requirements**—It meets the requirements under *Injections* <1>, except that the container may be designed to empty rapidly, and may exceed 1000 mL in capacity.

**Assay for citric acid**—

*Mobile Phase, Standard Preparation 1, and Chromatographic System*—Proceed as directed under *Assay for Citric Acid/Citrate and Phosphate* <345>.

*Assay preparation*—Transfer an accurately measured volume of Irrigation, equivalent to about 130 mg of monohydrate citric acid into a suitable volumetric flask, and proceed as directed for *Assay Preparation for Citric Acid/Citrate Assay* under *Assay for Citric Acid/Citrate and Phosphate* <345>.

*Procedure*—Proceed as directed for *Procedure* under <345>, and calculate the quantity, in mg per mL, of monohydrate citric acid ( $\text{C}_6\text{H}_8\text{O}_7 \cdot \text{H}_2\text{O}$ ) in the Irrigation taken by the formula:

$$0.001(210.14 / 189.10)C_s(D/V)(r_u / r_s)$$

in which 210.14 is the molecular weight of citric acid monohydrate; 189.10 is the molecular weight of citrate ( $\text{C}_6\text{H}_5\text{O}_7$ );  $C_s$  is the concentration, in  $\mu\text{g}$  per mL, of citrate in *Standard Preparation 1*;  $D$  is the dilution factor;  $V$  is the volume, in mL, of Irrigation used to prepare the *Assay preparation*; and  $r_u$  and  $r_s$  are the citrate peak areas obtained from the *Assay preparation* and *Standard Preparation 1*, respectively.

**Assay for magnesium oxide**—Transfer an accurately measured volume of Irrigation, equivalent to about 40 mg of magnesium oxide, to a beaker containing 130 mL of water heated to  $75 \pm 5^\circ$ , and add 4 mL of ammonium chloride TS and then 5 mL of ammonium hydroxide. Mix, and add slowly, with stirring, 8 mL of 8-hydroxyquinoline TS. After allowing to stand for 30 minutes at  $75^\circ$ , filter through a sintered-glass crucible, previously dried and weighed, and wash the precipitate with 50 mL of a warm mixture of water and 6 N ammonium hydroxide (45:5), followed by 50 mL of cool water. Dry the crucible and contents at  $105^\circ$  for 3 hours, cool, and weigh. Determine the equivalent of  $\text{MgO}$  in the portion of Irrigation taken by multiplying the weight of  $\text{C}_{18}\text{H}_{12}\text{MgN}_2\text{O}_2 \cdot 2\text{H}_2\text{O}$  so obtained by 0.1156.

**Assay for sodium carbonate**—

*Sodium chloride stock solution*—Transfer 475 mg of sodium chloride, previously dried at  $105^\circ$  for 2 hours and accurately weighed, to a 100-mL volumetric flask. Dissolve in water, dilute with water to volume, and mix.

*Internal standard solution*—Transfer 636 mg of lithium chloride to a 1000-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

*Standard preparation*—Quantitatively prepare a mixture of *Internal standard solution* and *Sodium chloride stock solution* (99:1).

*Assay preparation*—Dilute an accurately measured volume of Irrigation quantitatively with water to obtain a stock solution containing about 4.4 mg of sodium carbonate per mL. Quantitatively prepare a mixture of *Internal standard solution* and this stock solution (99:1).

*Procedure*—Concomitantly determine the emittances of the *Standard preparation* and the *Assay preparation* at 591 nm and 671 nm with a suitable flame photometer, adjusting the instrument to zero emittance with *Internal standard solution*. Calculate the quantity, in mg, of  $\text{Na}_2\text{CO}_3$  in each mL of the Irrigation taken by the formula:

$$(105.99/116.88)(C)(L/D)(R_{u,591} / R_{u,671})(R_{s,671} / R_{s,591})$$

in which 105.99 is the molecular weight of sodium carbonate; 116.88 is two times the molecular weight of sodium chloride;  $C$  is the concentration, in mg per mL, of sodium chloride in the *Sodium chloride stock solution*;  $L$  is the labeled quantity, in mg per mL, of sodium carbonate in the Irriga-

tion;  $D$  is the concentration, in mg per mL, of sodium carbonate in the stock solution used to prepare the *Assay preparation*, on the basis of the labeled quantity in each mL, and the extent of dilution;  $R_{U,591}$  and  $R_{U,671}$  are the emittance readings obtained from the *Assay preparation* at the wavelengths indicated by the subscripts; and  $R_{S,671}$  and  $R_{S,591}$  are the emittance readings obtained from the *Standard preparation* at the wavelengths indicated by the subscripts.

## Cladribine

$C_{10}H_{12}ClN_5O_3$  285.69  
Adenosine, 2-chloro-2'-deoxy-  
2-Chloro-2'-deoxyadenosine [4291-63-8].

» Cladribine contains not less than 98.0 percent and not more than 102.0 percent of  $C_{10}H_{12}ClN_5O_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers, and protect from light. Store between 2° and 8°.

**USP Reference standards** (11)—

USP Cladribine RS

USP Cladribine Related Compound A RS

**Identification**—

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between  $-17.0^\circ$  and  $-21.0^\circ$ .

*Test solution:* 10 mg per mL, in dimethylformamide.

**Water**, *Method I* (921): not more than 4.0%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, *Method II* (231): 0.002%.

**Related compounds**—

*Buffer, Diluent, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay*.

*Test solution*—Use the *Assay preparation*.

*Chromatographic system* (see *Chromatography* (621))—Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between cladribine and cladribine related compound A is not less than 1.5; and the tailing factor is not more than 2.0.

*Procedure*—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram,

and measure the peak responses. Calculate the percentage of each impurity in the portion of Cladribine taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response of each individual impurity, and  $r_s$  is the sum of the responses of all the peaks. Refer to *Table 1* of the impurity limits.

**Assay**—

*Buffer*—Dissolve 9.96 g of triethylamine phosphate, accurately weighed, in 500 mL of water, and add another 500 mL of water. Adjust with potassium hydroxide to a pH of 6.1.

*Diluent*—Prepare a mixture of water and methanol (90:10).

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer* and methanol (78:22). Make adjustments if necessary (see *System suitability* under *Chromatography* (621)).

*System suitability solution*—Prepare a solution of USP Cladribine RS and USP Cladribine Related Compound A RS in *Diluent* to obtain known concentrations of about 0.02 mg per mL each.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Cladribine RS in *Diluent* to obtain a concentration of 0.5 mg per mL.

*Assay preparation*—Transfer about 25 mg of Cladribine, accurately weighed, to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 265-nm detector and a 4.6-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution* and the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between cladribine and cladribine related compound A is not less than 1.5; the tailing factor for the cladribine peak in the *System suitability solution* is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{10}H_{12}ClN_5O_3$  in the portion of Cladribine taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Cladribine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Table 1**

Name	Relative Retention	
	Time	Limit (%)
2,6-Diaminopurine-2'-deoxyriboside	about 0.41	0.20
2'-Deoxyadenosine	about 0.47	0.20
2-Chloroadenine	about 0.60	0.20
2-Methoxy-2'-deoxyadenosine (cladribine related compound A)	about 0.91	0.20
Any individual unspecified impurity	—	0.10
Total impurities	—	1.0

## Clarithromycin

$C_{38}H_{69}NO_{13}$  747.95  
Erythromycin, 6-O-methyl-;  
6-O-Methylerythromycin [81103-11-9].

### DEFINITION

Clarithromycin contains NLT 96.0% and NMT 102.0% of clarithromycin ( $C_{38}H_{69}NO_{13}$ ), calculated on the anhydrous basis.

### IDENTIFICATION

#### A. INFRARED ABSORPTION <197K>

### ASSAY

#### Change to read:

#### PROCEDURE

**Solution A, Solution B, Mobile phase, Diluent, Standard solution 1, Standard solution 2, Standard solution 4, Sample solution, and Chromatographic system:** Proceed as directed in *Organic Impurities*.

#### System suitability

**Samples:** *Standard solution 2* and *Standard solution 4*  
[NOTE—See the relative retention times in *Table 2*. The typical retention time for clarithromycin is about 11 min.]

#### Suitability requirements

**Tailing factor:** NMT 1.7, *Standard solution 2*  
**Peak-to-valley ratio:** NLT 3.0, *Standard solution 4*  
The *Peak-to-valley ratio* is calculated as follows:

$$\text{Result} = H_P/H_V$$

$H_P$  = height, above the baseline, of the  
▲clarithromycin▲*USP36* impurity D peak,  
*Standard solution 4*

$H_V$  = height, above the baseline, of the lowest point  
of the curve separating the  
▲clarithromycin▲*USP36* impurity D peak from  
the clarithromycin peak, *Standard solution 4*

**Relative standard deviation:** NMT 1.5%, *Standard solution 2*

#### Analysis

**Samples:** *Standard solution 1* and *Sample solution*  
Calculate the percentage of clarithromycin ( $C_{38}H_{69}NO_{13}$ )  
in the portion of Clarithromycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area response from the *Sample solution*

$r_S$  = peak area response from *Standard solution 1*

$C_S$  = concentration of USP Clarithromycin RS in  
*Standard solution 1* (mg/mL)

$C_U$  = concentration of Clarithromycin in the *Sample solution* (mg/mL)

**Acceptance criteria:** 96.0%–102.0% on the anhydrous basis

### IMPURITIES

#### Change to read:

#### RESIDUE ON IGNITION <281>

**Sample:** 0.5 g

▲*USP36*

**Acceptance criteria:** NMT 0.2%

#### Change to read:

#### HEAVY METALS

**Diluent:** 85% v/v dioxane in water

**Lead nitrate stock solution:** ▲Dissolve 159.8 mg of lead nitrate in 100 mL of water to which has been added 1 mL of nitric acid. Dilute with water to 1000 mL. Prepare and store this solution in glass containers free from soluble lead salts.▲*USP36*

**Sample solution:** 50 mg/mL in *Diluent*. Transfer 12 mL of this solution to a color-comparison tube.

**Standard solution:** 1 ppm of Pb, prepared by diluting *Lead nitrate stock solution* with *Diluent*. Add 10 mL of this solution and 2 mL of the *Sample solution* to a color-comparison tube.

**Blank:** Add 10 mL of *Diluent* and 2 mL of the *Sample solution* to a color-comparison tube.

#### Analysis

**Samples:** *Sample solution*, *Standard solution*, and *Blank*  
To each of the three tubes add 2 mL of pH 3.5 acetate buffer, mix, then add 1.2 mL of thioacetamide–glycerin base TS, and mix.

**Acceptance criteria:** Compared to the *Blank*, the *Standard solution* shows a slight brown color. After 2 min, any brown color in the *Sample solution* is not more intense than that in the *Standard solution* (NMT 20 µg/g).

#### Change to read:

#### ORGANIC IMPURITIES

**Solution A:** 4.76 g/L of monobasic potassium phosphate. Adjust with dilute phosphoric acid (1 in 10) or potassium hydroxide (45% w/v) to a pH of 4.4. Pass this solution through a C18 filtration kit.

**Solution B:** Acetonitrile

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	75	25
32	40	60
34	40	60
36	75	25
42	75	25

**Diluent:** Acetonitrile and water (1:1)

**Standard solution 1:** 1.5 mg/mL of USP Clarithromycin RS in acetonitrile and water (1:1). Dissolve first in acetonitrile, using 50% of the final volume, and dilute with water to volume.

**Standard solution 2:** 75 µg/mL of USP Clarithromycin RS from *Standard solution 1* in *Diluent*

**Standard solution 3:** 7.5 µg/mL of USP Clarithromycin RS from *Standard solution 2* in *Diluent*

**Standard solution 4:** 1.5 mg/mL of USP Clarithromycin Identity RS in acetonitrile and water (1:1). Dissolve first in acetonitrile, using 50% of the final volume, and dilute with water to volume.

**Sample solution:** 1.5 mg/mL of Clarithromycin in acetonitrile and water (1:1). Dissolve first in acetonitrile, us-

ing 50% of the final volume, and dilute with water to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 205 nm

**Column:** 4.6-mm × 10-cm; packing L1

**Column temperature:** 40°

**Flow rate:** 1.1 mL/min

**Injection volume:** 10 µL

#### System suitability

**Samples:** *Standard solution 2* and *Standard solution 4*

[NOTE—See the relative retention times in *Table 2*. The typical retention time for clarithromycin is about 11 min.]

#### Suitability requirements

**Tailing factor:** NMT 1.7, *Standard solution 2*

**Peak-to-valley ratio:** NLT 3.0, *Standard solution 4*

The *Peak-to-valley ratio* is calculated as follows:

$$\text{Result} = H_p/H_v$$

$H_p$  = height, above the baseline, of the  
▲clarithromycin▲<sup>USP36</sup> impurity D peak,  
*Standard solution 4*

$H_v$  = height, above the baseline, of the lowest point  
of the curve separating the clarithromycin  
impurity D peak from the  
▲clarithromycin▲<sup>USP36</sup> peak, *Standard solution 4*

#### Analysis

**Samples:** *Diluent*, *Standard solution 2*, *Standard solution 3*, *Standard solution 4*, and *Sample solution*

Calculate the percentage of each impurity in the portion of Clarithromycin taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times \frac{1}{F} \times 100$$

$r_U$  = peak response of any individual impurity from  
the *Sample solution*

$r_S$  = peak response of clarithromycin from *Standard solution 3*

$C_S$  = concentration of USP Clarithromycin RS in  
*Standard solution 3* (mg/mL)

$C_U$  = concentration of Clarithromycin in the *Sample solution* (mg/mL)

$F$  = relative response factor (see *Table 2*)

▲**Acceptance criteria:** See *Table 2*.

**Any individual impurity:** NMT 1.0%. NMT four impurities exceed 0.4%.

**Total impurities:** NMT 3.5%

**Table 2**

## Clarithromycin for Oral Suspension

### DEFINITION

Clarithromycin for Oral Suspension is a dry mixture of Clarithromycin, dispersing agents, diluents, preservatives, and flavorings. It contains NLT 90.0% and NMT 115.0% of the labeled amount of clarithromycin ( $C_{38}H_{69}NO_{13}$ ), the labeled amount being 25 mg or 50 mg/mL when constituted as directed in the labeling.

### IDENTIFICATION

- A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### Change to read:

#### PROCEDURE

**Buffer:** 0.067 M monobasic potassium phosphate  
**Mobile phase:** Methanol and *Buffer* (60:40), adjusted with phosphoric acid to a pH of 3.5. Pass through a suitable filter.

**Standard stock solution:** Equivalent to 2.1 mg/mL of clarithromycin from USP Clarithromycin RS in methanol  
**Standard solution:** 0.415 mg/mL of clarithromycin from *Standard stock solution* in *Mobile phase*

**Sample stock solution:** Constitute the Clarithromycin for Oral Suspension as directed in the labeling. Transfer an aliquot of the suspension, equivalent to 1–2 g of clarithromycin, with the aid of 330 mL of *Buffer*, to a 1000-mL volumetric flask containing 50 mL of *Buffer*. Shake by mechanical means for 30 min, and dilute with methanol to volume. Sonicate for about 30 min, and allow to cool. Dilute with methanol to volume, add a magnetic stirring bar, and stir for 60 min. Allow to settle, and use the clear supernatant.

**Sample solution:** Transfer an aliquot of the *Sample stock solution*, nominally equivalent to 20 mg of clarithromycin, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and pass through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

#### Columns

**Guard (optional):** Packing L1

**Analytical:** 4.6-mm × 15-cm; packing L1

**Column temperature:** 50°

**Flow rate:** 1 mL/min

**Injection volume:** 50 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements** ▲<sup>USP36</sup>

**Tailing factor:** 1.0–1.7

▲<sup>USP36</sup>

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of the labeled amount of clarithromycin ( $C_{38}H_{69}NO_{13}$ ) in the portion of the constituted Clarithromycin for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak area response from the *Sample solution*  
 $r_S$  = peak area response from the *Standard solution*  
 $C_S$  = concentration of the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of clarithromycin in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–115.0%

### PERFORMANCE TESTS

- UNIFORMITY OF DOSAGE UNITS** (905) (for powder packaged in single-unit containers): Meets the requirements
- DELIVERABLE VOLUME** (698) (for powder packaged in multi-unit containers): Meets the requirements

### SPECIFIC TESTS

#### pH (791)

**Sample:** Use the suspension constituted as directed in the labeling.

**Acceptance criteria:** 4.0–5.4

#### LOSS ON DRYING (731)

**Sample:** 1 g

**Analysis:** Dry under vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h.

**Acceptance criteria:** NMT 2.0%

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in tight containers.
- USP REFERENCE STANDARDS** (11)  
 USP Clarithromycin RS

## Clarithromycin Tablets

### DEFINITION

Clarithromycin Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of  $C_{38}H_{69}NO_{13}$ .

### IDENTIFICATION

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Methanol and 0.067 M monobasic potassium phosphate (13:7). Adjust with phosphoric acid to a pH of 4.0, and pass through a suitable filter.

**Standard stock solution:** 625 µg/mL of clarithromycin from USP Clarithromycin RS dissolved in methanol.

[NOTE—Shake and sonicate to facilitate dissolution.]

**Standard solution:** 125 µg/mL of clarithromycin from *Standard stock solution* in *Mobile phase*. Pass through a suitable filter.

**System suitability stock solution:** 625 µg/mL of USP Clarithromycin Related Compound A RS in methanol.

**System suitability solution:** 125 µg/mL of USP Clarithromycin RS from *Standard stock solution* and 125 µg/mL of USP Clarithromycin Related Compound A RS from *System suitability stock solution* in *Mobile phase*

**Sample stock solution:** Equivalent to 4 mg/mL of clarithromycin from finely powdered Tablets in methanol. [NOTE—Shake by mechanical means for 30 min to disperse and allow any insoluble matter to settle.]

**Sample solution:** 120 µg/mL of clarithromycin from *Sample stock solution* in *Mobile phase*. Pass through a filter of 0.5-µm or finer pore size.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 15-cm; packing L1

[NOTE—A guard column containing packing L1 may be added.]

**Column temperature:** 50°

**Flow rate:** 1 mL/min

**Injection size:** 20–50 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for clarithromycin and clarithromycin related compound A are 0.75 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between clarithromycin and clarithromycin related compound A, *System suitability solution*

**Column efficiency:** NLT 750 theoretical plates from the clarithromycin peak, *Standard solution*

**Tailing factor:** 0.9–1.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate percentage of label claim of  $C_{38}H_{69}NO_{13}$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of clarithromycin in the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of the *Sample solution* ( $\mu\text{g/mL}$ )

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Buffer solution:** Prepare a solution containing 13.61 mg/mL of sodium acetate trihydrate in water. Prepare another solution by diluting 5.7 mL of glacial acetic acid to 1 L with water. Combine portions of the two solutions to obtain a pH of 5.0.

**Medium:** *Buffer solution*, 900 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** Proceed as directed in the *Assay*.

**Sample solution:** Dilute with *Mobile phase* to yield a nominal concentration of 125  $\mu\text{g/mL}$  of clarithromycin.

**Mobile phase, System suitability solution, Chromatographic system, and System suitability:** Proceed as directed for *Assay*.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the amount of  $C_{38}H_{69}NO_{13}$  dissolved in the *Medium*, as directed in the *Assay*.

Calculate the percentage of clarithromycin dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of the *Sample solution*

$r_S$  = peak area of the *Standard solution*

$C_S$  = concentration of the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = nominal concentration of the *Sample solution* ( $\mu\text{g/mL}$ )

**Tolerances:** NLT 80% (Q) of the labeled amount of  $C_{38}H_{69}NO_{13}$  is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS (905): Meet the requirements

#### SPECIFIC TESTS

##### • LOSS ON DRYING <731>: Dry a portion of powdered Tablets in vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 h: it loses NMT 6.0% of its weight.

#### ADDITIONAL REQUIREMENTS

##### • PACKAGING AND STORAGE: Preserve in tight containers.

##### • USP REFERENCE STANDARDS <11>

USP Clarithromycin RS

USP Clarithromycin Related Compound A RS

6,11-Di-O-methylerythromycin A.

$C_{39}H_{71}NO_{13}$  762.00

## Clarithromycin Extended-Release Tablets

#### DEFINITION

Clarithromycin Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clarithromycin ( $C_{38}H_{69}NO_{13}$ ).

#### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### Change to read:

##### • PROCEDURE

**Buffer A:** 0.067 M monobasic potassium phosphate  
**Mobile phase:** Methanol and *Buffer A* (13:7). Adjust with phosphoric acid to a pH of 4.0. Pass through a suitable filter.

**Standard stock solution:** 625  $\mu\text{g/mL}$  of clarithromycin from USP Clarithromycin RS in methanol. Shake and sonicate, if necessary, to facilitate dissolution.

**Standard solution:** 125  $\mu\text{g/mL}$  of clarithromycin in *Mobile phase* from *Standard stock solution*. Pass through a suitable filter.

**System suitability stock solution:** 625  $\mu\text{g/mL}$  of USP Clarithromycin Related Compound A RS in methanol

**System suitability solution:** 125  $\mu\text{g/mL}$  of USP Clarithromycin Related Compound A RS from *System suitability stock solution* and 125  $\mu\text{g/mL}$  of clarithromycin from *Standard stock solution* in *Mobile phase*

**Sample stock solution:** Transfer nominally 2000 mg of clarithromycin from finely powdered Tablets to a 500-mL volumetric flask with the aid of methanol. Add about 350 mL of methanol, and shake by mechanical means for 30 min. Dilute with methanol to volume, and sonicate for 30 min. Cool to room temperature, and allow to stand for at least 16 h. Mix, allow any insoluble matter to settle, and use the supernatant.

**Sample solution:** Transfer 3.0 mL of the *Sample stock solution* to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume. Pass through a suitable filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

## SPECIFIC TESTS

### Delete the following:

- ▲ **LOSS ON DRYING** <731>: Dry a portion of powdered Tablets in a vacuum at a pressure not exceeding 5 mm of mercury at 110° for 3 h: it loses NMT 5.0% of its weight.

▲ USP36

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at 25°, excursions permitted between 15° and 30°.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS** <11>
  - USP Clarithromycin RS
  - USP Clarithromycin Related Compound A RS
  - 6,11-Di-O-methylethylerythromycin A.
  - C<sub>39</sub>H<sub>71</sub>NO<sub>13</sub> 762.00

## Clavulanate Potassium

C<sub>8</sub>H<sub>8</sub>KNO<sub>5</sub> 237.25  
 4-Oxa-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 3-(2-hydroxyethylidene)-7-oxo-, monopotassium salt, 2R-(2 $\alpha$ ,3Z,5 $\alpha$ )-;  
 Potassium (Z)-(2R,5R)-3-(2-hydroxyethylidene)-7-oxo-4-oxa-1-azabicyclo[3.2.0]heptane-2-carboxylate [61177-45-5].

## DEFINITION

Clavulanate Potassium contains the equivalent of NLT 75.5% and NMT 92.0% of clavulanic acid (C<sub>8</sub>H<sub>9</sub>NO<sub>5</sub>), calculated on the anhydrous basis.

## IDENTIFICATION

- **A.** The retention time of the major peak for clavulanic acid in the *Sample solution* corresponds to that in the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Potassium** <191>: Meets the requirements

## ASSAY

### PROCEDURE

**Solution A:** 7.8 mg/mL of monobasic sodium phosphate in water. Adjust with phosphoric acid or 10 N sodium hydroxide to a pH of 4.4  $\pm$  0.1 before final dilution.

**Mobile phase:** Methanol and *Solution A* (1:19)

**Standard solution:** 0.25 mg/mL of USP Clavulanate Lithium RS in water

**System suitability solution:** 0.5 mg/mL of amoxicillin dissolved in *Standard solution*

**Sample solution:** 0.25 mg/mL of Clavulanate Potassium in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4-mm  $\times$  30-cm; 3- to 10- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for clavulanic acid and amoxicillin are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.5 between the amoxicillin and clavulanic acid peaks, *System suitability solution*

**Column efficiency:** NLT 550 theoretical plates, *Standard solution*

**Tailing factor:** NMT 1.5, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_8H_9NO_5$  in each mg of Clavulanate Potassium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Clavulanate Lithium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Clavulanate Potassium in the *Sample solution* (mg/mL)

$P$  = designated potency of USP Clavulanate Lithium RS, in  $\mu\text{g}/\text{mg}$  of clavulanic acid

$F$  = unit conversion factor, 0.001 mg/ $\mu\text{g}$

**Acceptance criteria:** 75.5%–92.0% on the anhydrous basis

### IMPURITIES

#### Organic Impurities

##### • PROCEDURE 1

**Solution A:** 0.05 M monobasic sodium phosphate. Adjust with phosphoric acid to a pH of  $4.0 \pm 0.1$ .

**Solution B:** Methanol and *Solution A* (1:1)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
4	100	0
15	50	50
18	50	50
24	100	0

**Standard solution:** 0.1 mg/mL of USP Clavulanate Lithium RS in *Solution A*

**Sample solution:** 10.0 mg/mL of Clavulanate Potassium in *Solution A*

**System suitability solution:** 0.1 mg/mL each of USP Clavulanate Lithium RS and amoxicillin in *Solution A*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 230 nm

**Column:** 4.6-mm  $\times$  10-cm; 5- $\mu\text{m}$  packing L1

**Temperature:** 40°

**Flow rate:** 1 mL/min

[NOTE—The system is equilibrated for 15 min with 100% *Solution A*.]

**Injection size:** 20  $\mu\text{L}$

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for clavulanic acid and amoxicillin are about 1.0 and 2.5, respectively.]

#### Suitability requirements

**Resolution:** NLT 13 between the clavulanic acid peak and the amoxicillin peak, *System suitability solution*

**Column efficiency:** NLT 2000 theoretical plates from the clavulanic acid peak, *System suitability solution*

**Tailing factor:** NMT 2.0 for the clavulanic acid peak, *System suitability solution*

**Relative standard deviation:** NMT 2%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage, in terms of clavulanate potassium equivalent, of each impurity in the Clavulanate Potassium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

$r_U$  = peak response of an individual impurity peak from the *Sample solution*

$r_S$  = peak response of clavulanic acid from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Clavulanate Potassium from the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of clavulanate potassium, 237.3

$M_{r2}$  = molecular weight of clavulanate lithium, 205.1

#### Acceptance criteria

**Total impurities:** NMT 2%

##### • PROCEDURE 2: LIMIT OF CLAVAM-2-CARBOXYLATE POTASSIUM

**Mobile phase:** 0.1 M monobasic sodium phosphate.

Adjust with phosphoric acid to a pH of  $4.0 \pm 0.1$ .

**Standard solution:** 5  $\mu\text{g}/\text{mL}$  of USP Clavam-2-Carboxylate Potassium RS in water

**Sample solution:** 10 mg/mL of Clavulanate Potassium in water

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4-mm  $\times$  30-cm; 3- to 10- $\mu\text{m}$  packing L1

**Flow rate:** 0.5 mL/min

**Injection size:** 20  $\mu\text{L}$

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for clavam-2-carboxylic acid and clavulanic acid are about 0.7 and 1.0, respectively.]

#### Suitability requirements

**Column efficiency:** NLT 4000 theoretical plates

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 5%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of clavam-2-carboxylate potassium in the sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* ( $\mu\text{g}/\text{mL}$ )

$C_U$  = nominal concentration of Clavulanate Potassium in the *Sample solution* (mg/mL)

$F$  = unit conversion factor, 0.001 mg/ $\mu\text{g}$

**Acceptance criteria:** NMT 0.01%

##### • PROCEDURE 3: LIMIT OF ALIPHATIC AMINES

**Internal standard solution:** 50  $\mu\text{L}$  of 3-methyl-2-pentanone in water to 100 mL

**Standard solution:** Dissolve 80.0 mg of each of the following amines in 2 N hydrochloric acid: 1,1-dimethylethylamine, diethylamine, tetramethylethylenediamine, 1,1,3,3-tetramethylbutylamine, and *N,N'*-diisopropylethylenediamine. Dilute with 2 N hydrochloric acid to 200.0 mL. Transfer 5.0 mL of this solution to a centrifuge tube. Add 5.0 mL of *Internal standard solution*, 10.0 mL of 2 N sodium hydroxide, 5.0 mL of isopropyl alcohol, and 5 g of sodium chloride. Shake for 1

min, and centrifuge to separate the layers. Use the upper layer.

**Sample solution:** Transfer 1.0 g of Clavulanate Potassium to a centrifuge tube, add 5.0 mL of *Internal standard solution*, 5.0 mL of 2 N sodium hydroxide, 10.0 mL of water, 5.0 mL of isopropyl alcohol, and 5 g of sodium chloride. Shake for 1 min, and centrifuge to separate the layers. Use the upper layer.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 50-m capillary fused silica column that contains a 5-μm film coating of stationary phase G41

**Temperature**

**Injector:** 200°

**Detector:** 250°

**Column:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
35	—	35	7
35	30	150	15

**Carrier gas:** Helium

**Flow rate:** 8 mL/min

**Split ratio:** 1:10

**Injection size:** 1 μL

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE— See the table below for relative retention times.]

Name	Relative Retention Time
1,1-Dimethylethylamine	0.55
Diethylamine	0.76
3-Methyl-2-pentanone (internal standard)	1.0
Tetramethylethylenediamine	1.07
1,1,3,3-Tetramethylbutylamine	1.13
N,N'-Diisopropylethylenediamine	1.33
Bis(2-methylamino)ethyl ether <sup>a</sup>	1.57

<sup>a</sup> The relative retention time for this compound is provided for information only; bis(2-methylamino)ethyl ether is not a component of the *Standard solution*.

Calculate the percentage of each impurity in the Clavulanate Potassium taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for an individual impurity from the *Sample solution*

$r_S$  = peak response for the relevant analyte from the *Standard solution*

$C_S$  = concentration of the relevant analyte in the *Standard solution*

$C_U$  = nominal concentration of Clavulanate Potassium in the *Standard solution*

Calculate the percentage of any individual impurity for which no relevant reference compound is provided in the *Standard solution* by the same formula, except for  $r_S$  use the peak response corresponding to the 1,1-dimethylethylamine peak.

#### Acceptance criteria

**Total of all aliphatic amines:** NMT 0.2%

#### PROCEDURE 4: LIMIT OF 2-ETHYLHEXANOIC ACID

**Internal standard solution:** 1 mg/mL of 3-cyclohexylpropionic acid in cyclohexane

**Standard solution:** 1.5 mg/mL of 2-ethylhexanoic acid in *Internal standard solution*. Transfer 1.0 mL of this solution to a centrifuge tube, and add 4.0 mL of 4 N hydrochloric acid. Shake for 1 min, and allow the phases to separate, centrifuging if necessary. Withdraw the lower phase, and reserve the upper phase. To the lower phase add 1.0 mL of *Internal standard solution*, and shake for 1 min. Allow the phases to separate, centrifuging if necessary. Withdraw the upper phase, and combine with the reserved upper layer.

**Sample solution:** Transfer 300 mg of Clavulanate Potassium to a centrifuge tube. Add 4.0 mL of 4 N hydrochloric acid, and shake with two successive 1.0-mL portions of the *Internal standard solution*. Allow the phases to separate, centrifuging if necessary. Use the combined upper phases.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.53-mm × 25-m capillary fused silica; 1-μm film coating of stationary phase G35

**Temperature**

**Injector temperature:** 200°

**Detector temperature:** 300°

**Column temperature:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
40	—	40	2
40	30	200	3

**Carrier gas:** Hydrogen

**Flow rate:** 100 cm/s

**Injection size:** 1 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Resolution:** NLT 2.0 between the 2-ethylhexanoic acid peak and the 3-cyclohexylpropionic acid peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of 2-ethylhexanoic acid in the Clavulanate Potassium taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak area response ratio of 2-ethylhexanoic acid to 3-cyclohexylpropionic acid from the *Sample solution*

$R_S$  = peak area response ratio of 2-ethylhexanoic acid to 3-cyclohexylpropionic acid from the *Standard solution*

$C_S$  = concentration of 2-ethylhexanoic acid in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of Clavulanate Potassium in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.8%

#### SPECIFIC TESTS

• **BACTERIAL ENDOTOXINS TEST (85):** Where the label states that Clavulanate Potassium is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.03 USP Endotoxin Unit/mg.

• **STERILITY TESTS (71):** Where the label states that Clavulanate Potassium is sterile, it meets the requirements when tested as directed under *Test for Sterility of the Product to Be Examined, Membrane Filtration*.

- **pH** <791>: 5.5–8.0, in a 10 mg/mL solution
- **WATER DETERMINATION**, *Method I* <921>: NMT 1.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** <11>
  - USP Clavam-2-Carboxylate Potassium RS
  - USP Clavulanate Lithium RS
  - USP Endotoxin RS

---

**Clemastine Fumarate**

---

$C_{21}H_{26}ClNO \cdot C_4H_4O_4$  459.96  
 Pyrrolidine, 2-[2-[1-(4-chlorophenyl)-1-phenylethoxy]ethyl]-1-methyl-, [R-(R\*,R\*)]-, (E)-2-butenedioate (1:1).  
 (+)-(2R)-2-[2-[[[(R)-p-Chloro- $\alpha$ -methyl- $\alpha$ -phenylbenzyl]oxy]ethyl]-1-methylpyrrolidine fumarate (1:1) [14976-57-9].

» Clemastine Fumarate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, at a temperature not exceeding 25°.

**USP Reference standards** <11>—

USP Clemastine Fumarate RS

**Clarity and color of solution**—Dissolve 100 mg of Clemastine Fumarate in 10.0 mL of methanol, and mix to obtain the *Test solution*. Prepare a *Comparison solution* by mixing 2.5 mL of 0.0002 M sodium chloride, 2.5 mL of water, 5.0 mL of 2.5 N nitric acid, and 1.0 mL of 0.1 N silver nitrate, and use this solution within 5 minutes. Prepare a *Color matching fluid* by mixing 1 volume of *Matching Fluid C* (see *Color and Achromicity* <631>) with 3 volumes of water. Transfer the *Test solution*, the *Comparison solution*, and 10 mL of *Color matching fluid* to separate test tubes having the same nominal diameter (about 12 mm). View the *Test solution* and the *Comparison solution* horizontally against a dull black background: the *Test solution* is clear or not more opalescent than the *Comparison solution*. View the *Test solution* and *Color matching fluid* horizontally against a dull white background: the *Test solution* is colorless or not more intensely colored than *Color matching fluid*.

**Identification**—

**A:** *Infrared Absorption* <197M>.

**B:** Prepare a *Test preparation* by dissolving 40 mg of Clemastine Fumarate in 2.0 mL of dilute alcohol (8 in 10) with slight warming. Similarly prepare a *Standard preparation* by dissolving 50 mg of fumaric acid in 10.0 mL of dilute alcohol (8 in 10). Separately apply 5- $\mu$ L portions of the *Test preparation* and the *Standard preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture, and dry the spots with the aid of a current of air.

Develop the chromatogram in a solvent system consisting of a mixture of diisopropyl ether, formic acid, and water (70:25:5) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, dry at 100° for 30 minutes, cool, and spray the plate with 0.1 M potassium permanganate. Dry briefly with the aid of a current of warm air, and examine the chromatogram: the principal spot obtained from the *Test preparation* corresponds in  $R_f$  value, color, and intensity to that obtained from the *Standard preparation*.

**Specific rotation** <781S>: between +15.0° and +18.0° ( $t = 20^\circ$ ).

*Test solution:* 10 mg per mL, in methanol.

**pH** <791>: between 3.2 and 4.2, in a suspension (1 in 10).

**Loss on drying** <731>—Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

**Heavy metals**, *Method II* <231>: 0.002%.

**Chromatographic purity**—

**Spray reagent**—Dissolve 850 mg of bismuth subnitrate in a mixture of 10 mL of glacial acetic acid and 40 mL of water, and mix (*Solution A*). Dissolve 8 g of potassium iodide in 20 mL of water (*Solution B*). Mix 5.0 of *Solution A*, 5.0 mL of *Solution B*, and 20 mL of glacial acetic acid in a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparation**—Dissolve a suitable quantity of USP Clemastine Fumarate RS in a mixture of chloroform and methanol (1:1) to obtain a solution having a known concentration of 20 mg per mL. Dilute portions of this solution quantitatively with the mixture of chloroform and methanol (1:1) to prepare 5 *Comparison solutions* having known concentrations of 0.10, 0.08, 0.06, 0.04, and 0.02 mg per mL, respectively (0.5%, 0.4%, 0.3%, 0.2%, and 0.1% of the *Standard preparation*, respectively).

**Test preparation**—Dissolve 100 mg of Clemastine Fumarate in 5.0 mL of a mixture of chloroform and methanol (1:1), and mix.

**Procedure**—Separately apply 5- $\mu$ L portions of the *Standard preparation*, each of the 5 *Comparison solutions*, and the *Test preparation* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (90:10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at room temperature with the aid of a current of air. Locate the spots on the plate by spraying first with *Spray reagent*, then with 3% hydrogen peroxide: the principal spot obtained from the *Test preparation* corresponds in  $R_f$  value, color, and intensity to that obtained from the *Standard preparation*; the sum of the intensities of any secondary spots, if present in the chromatogram from the *Test preparation*, corresponds to not more than 1.0%; and the intensities of any secondary spots do not exceed 0.5% of that of the principal spot in the chromatogram from the *Standard preparation* on the basis of comparison with spots obtained from the *Comparison solutions*.

**Assay**—Transfer about 350 mg of Clemastine Fumarate, accurately weighed, to a small conical flask, and dissolve in 60 mL of glacial acetic acid. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 46.00 mg of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$ .

## Clemastine Fumarate Tablets

» Clemastine Fumarate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Clemastine Fumarate RS

**Identification**—

*Spray reagent*—Prepare as directed in the test for *Chromatographic purity* under *Clemastine Fumarate*.

*Standard preparation*—Prepare a solution in a mixture of chloroform and methanol (1:1) having a concentration of about 2.5 mg of USP Clemastine Fumarate RS per mL.

*Test preparation*—Place a portion of powdered Tablets, equivalent to about 2.5 mg of clemastine fumarate, in a glass-stoppered flask. Add 10 mL of a mixture of chloroform and methanol (1:1), and shake for 20 minutes. Filter, wash the residue with two 5-mL portions of the mixture of chloroform and methanol (1:1), and evaporate the combined filtrate and washings to dryness under vacuum. Dissolve the residue so obtained in 1 mL of the mixture of chloroform and methanol (1:1), and mix.

*Procedure*—Proceed as directed for *Procedure* in the test for *Chromatographic purity* under *Clemastine Fumarate*, applying 5- $\mu$ L portions of the *Standard preparation* and the *Test preparation* on the thin-layer chromatographic plate: the  $R_f$  value of the principal spot obtained from the *Test preparation* corresponds to that obtained from the *Standard preparation*.

**Dissolution** (711)—

*pH 4.0 citrate buffer*—Dissolve 20.0 g of monohydrate citric acid in about 1000 mL of water, add 22.0 mL of sodium hydroxide solution (3 in 10) and 8.8 mL of hydrochloric acid, and dilute with water to 2000 mL. Adjust, if necessary, with sodium hydroxide solution (1 in 2) to a pH of 4.0.

*Medium*: pH 4.0 citrate buffer; 500 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

*Procedure*—Centrifuge 60 mL of the solution under test for 20 minutes at 4000 rpm, and transfer 50.0 mL of the supernatant to a 125-mL separator. To a second 125-mL separator transfer 50.0 mL of a *Standard preparation* that is prepared by dissolving an accurately weighed quantity of USP Clemastine Fumarate RS in *Dissolution Medium* and diluting quantitatively and stepwise with *Dissolution Medium* to yield a solution having a known concentration comparable with that of the solution under test. To a third 125-mL separator transfer 50.0 mL of *Dissolution Medium* to provide a blank. Treat each of the solutions in the three separators as follows. Add 10 mL of methyl orange solution (2 in 10,000), mix, add 20.0 mL of chloroform, shake simultaneously by mechanical means for 10 minutes, remove the chloroform layer, and centrifuge the chloroform layer for 10 minutes at 4000 rpm. Determine the amount of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$  dissolved from absorbances at the wavelength of maximum absorbance at about 420 nm of the chloroform solutions obtained from the solution under test and the *Standard preparation*, using the chloroform solution obtained from the blank to set the instrument.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

*Dye solution*—Dissolve 100 mg of bromocresol purple in 1000 mL of 0.33 N acetic acid, and mix.

*Acetous methanol*—Dilute 100 mL of methanol with sufficient 0.33 N acetic acid to prepare 1000 mL of solution, and mix.

*Standard preparation*—Transfer about 27 mg of USP Clemastine Fumarate RS, accurately weighed, to a 100-mL volumetric flask, dissolve in 10 mL of methanol, dilute with 0.33 N acetic acid to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Acetous methanol* to volume, and mix.

*Test preparation*—Mix 1 finely powdered Tablet with an accurately measured volume of *Acetous methanol*, sufficient to obtain a solution having a concentration of about 27  $\mu$ g of clemastine fumarate per mL. Shake for 30 minutes, and filter, discarding the first few mL of the filtrate.

*Procedure*—Transfer 15.0 mL each of the *Standard preparation*, the *Test preparation*, and *Acetous methanol* to provide the blank to individual 125-mL separators. Add 25 mL of *Dye solution* and 50.0 mL of chloroform to each, and shake by mechanical means for 15 minutes. Allow the layers to separate, and filter the chloroform layers. Concomitantly determine the absorbances of the filtered solutions obtained from the *Test preparation* and the *Standard preparation* at the wavelength of maximum absorbance at about 406 nm, using the blank to set the instrument. Calculate the quantity, in mg, of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$  in the Tablet taken by the formula:

$$(TC / D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of clemastine fumarate in the Tablet;  $C$  is the concentration, in  $\mu$ g per mL, of USP Clemastine Fumarate RS in the *Standard preparation*;  $D$  is the concentration, in  $\mu$ g per mL, of clemastine fumarate in the *Test preparation*, based on the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Assay**—

*pH 7 phosphate buffer*—Transfer 9.47 g of anhydrous dibasic sodium phosphate to a 1000-mL volumetric flask, dilute with water to volume, and mix (*flask A*). Transfer 9.08 g of monobasic potassium phosphate to a 1000-mL volumetric flask, dilute with water to volume, and mix (*flask B*). Mix 612 mL of *A* with 388 mL of *B*.

*Dilute phosphate buffer*—Prepare a mixture of 1 volume of pH 7 phosphate buffer and 3 volumes of water.

*Mobile phase*—Prepare a suitable and degassed solution of methanol and *Dilute phosphate buffer* (83:17).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Clemastine Fumarate RS in a mixture of methanol and water (1:1) to obtain a solution having a known concentration of about 0.14 mg per mL.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed quantity of the powder, equivalent to about 14 mg of clemastine fumarate, to a 200-mL conical flask. Pipet 100 mL of a mixture of methanol and water (1:1) into the flask, shake for 30 minutes, centrifuge, and filter the supernatant.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 4 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 1.5%.

*Procedure*—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate

the quantity, in mg, of  $C_{21}H_{26}ClNO \cdot C_4H_4O_4$  in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Clemastine Fumarate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses of clemastine fumarate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clenbuterol Hydrochloride

$C_{12}H_{18}Cl_2N_2O \cdot HCl$  313.65  
Ethanol, 1-(4-amino-3,5-dichlorophenyl)-2-(*tert*-butylamino), hydrochloride;  
4-Amino- $\alpha$ -[(*tert*-butylamino)methyl]-3,5-dichlorobenzyl alcohol, hydrochloride [21898-19-1].

### DEFINITION

Clenbuterol Hydrochloride contains NLT 98.0% and NMT 102.0% of  $C_{12}H_{18}Cl_2N_2O \cdot HCl$ , calculated on the anhydrous basis.

### IDENTIFICATION

#### A. INFRARED ABSORPTION (197K)

[NOTE—Alternatively, *Infrared Absorption* (197A) may be used.]

#### B. IDENTIFICATION TESTS—GENERAL, Chloride (191):

Meets the requirements

### ASSAY

#### PROCEDURE

**Sample solution:** Dissolve 0.25 g in 50 mL of alcohol, and add 5.0 mL of 0.01 N hydrochloric acid.

**Analysis:** Titrate with 0.1 N sodium hydroxide VS, determining the endpoint potentiometrically. Read the volume added between the two points of inflection. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N sodium hydroxide is equivalent to 31.37 mg of  $C_{12}H_{18}Cl_2N_2O \cdot HCl$ .

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### IMPURITIES

#### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%, from 1–2 g
- **HEAVY METALS, Method II** (231): NMT 10 ppm

#### Organic Impurities

##### PROCEDURE

**Buffer:** Dissolve 3.0 g of sodium 1-decanesulfonate and 5.0 g of monobasic potassium phosphate in 900 mL of water, adjust with dilute phosphoric acid (1 in 10) to a pH of 3.0, and dilute with water to 1000 mL.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (2:2:6)

**System suitability solution:** 0.2 mg/mL each of USP Clenbuterol Related Compound B RS and Clenbuterol Hydrochloride in *Mobile phase*

**Sample solution 1:** 2.0 mg/mL of Clenbuterol Hydrochloride in *Mobile phase*

**Sample solution 2:** 2.0  $\mu$ g/mL of Clenbuterol Hydrochloride in *Mobile phase*, from *Sample solution 1*

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 215 nm

**Column:** 4.0-mm  $\times$  12.5-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 0.5 mL/min

**Injection size:** 5  $\mu$ L

### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 4.0 between clenbuterol related compound B and clenbuterol

**Relative standard deviation:** NMT 2.0% for the clenbuterol peak

### Analysis

**Samples:** *Sample solution 1* and *Sample solution 2*

Calculate the percentage of impurities in the portion of  $C_{12}H_{18}Cl_2N_2O \cdot HCl$  taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from *Sample solution 1*

$r_S$  = peak response of clenbuterol from *Sample solution 2*

$C_S$  = concentration of Clenbuterol Hydrochloride in *Sample solution 2* (mg/mL)

$C_U$  = concentration of Clenbuterol Hydrochloride in *Sample solution 1* (mg/mL)

### Acceptance criteria

**Individual impurities:** 0.1%

**Total impurities:** NMT 0.2%

[NOTE— The reporting level for impurities is 0.05%.]

### SPECIFIC TESTS

#### OPTICAL ROTATION, Specific Rotation (781S)

**Sample:** 30 mg/mL in water, filter as necessary

**Acceptance criteria:**  $-10^\circ$  to  $+10^\circ$  at 20°

#### PH (791):

5.0–7.0

**Sample:** 50 mg/mL in carbon dioxide-free water

#### WATER DETERMINATION, Method I (921):

NMT 1.0%

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, protected from light. Store at room temperature.

• **LABELING:** Label it to indicate that it is for veterinary use only.

#### USP REFERENCE STANDARDS (11)

USP Clenbuterol Hydrochloride RS

USP Clenbuterol Related Compound B RS

1-(4-Amino-3,5-dichlorophenyl)-2-*tert*-butyl-aminoethanone hydrochloride.

$C_{12}H_{16}Cl_2N_2O \cdot HCl$  311.64

## Clidinium Bromide

$C_{22}H_{26}BrNO_3$

432.35

1-Azoniabicyclo[2.2.2]octane, 3-[(hydroxydiphenylacetyl)oxy]-1-methyl-, bromide, ( $\pm$ );

( $\pm$ )-3-Hydroxy-1-methylquinuclidinium bromide benzilate [3485-62-9].

### DEFINITION

Clidinium Bromide contains NLT 99.0% and NMT 100.5% of  $C_{22}H_{26}BrNO_3$ , calculated on the dried basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)
- **B.** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the test for *Organic Impurities*.
- **C. BROMIDE**  
*Sample solution:* 50 mg/mL  
*Analysis:* To 2 mL of the *Sample solution* add a few drops of 2 N nitric acid and 1 mL of silver nitrate TS.  
*Acceptance criteria:* A yellowish white precipitate is formed.

**ASSAY**

- **PROCEDURE**  
*Sample:* 1.2 g  
*Analysis:* Dissolve the *Sample* in 80 mL of glacial acetic acid, warming if necessary to effect solution. Cool, and add 15 mL of mercuric acetate TS. Titrate with 0.1 N perchloric acid in dioxane VS, determining the endpoint potentiometrically. Perform a blank determination (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 43.24 mg of  $C_{22}H_{26}BrNO_3$ .  
*Acceptance criteria:* 99.0%–100.5% on the dried basis

**IMPURITIES**

- **RESIDUE ON IGNITION** (281): NMT 0.1%
- **HEAVY METALS** (231)  
*Sample solution:* 1 g in 25 mL of water  
*Acceptance criteria:* NMT 20 ppm
- **ORGANIC IMPURITIES**  
*Standard solution:* 100 mg/mL of USP Clidinium Bromide RS in 0.1 N methanolic hydrochloric acid  
*Sample solution:* 100 mg/mL of Clidinium Bromide in 0.1 N methanolic hydrochloric acid  
*Reference solution:* Dissolve 100 mg of USP Clidinium Bromide RS in 1.0 mL of 0.1 N methanolic hydrochloric acid, and add 20  $\mu$ L of a solution of 25.0 mg of USP Clidinium Bromide Related Compound A RS in 1.0 mL of 0.1 N methanolic hydrochloric acid.  
**Chromatographic system**  
(See *Chromatography* (621), *Thin-Layer Chromatography*).  
*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture  
*Application volume:* 20  $\mu$ L  
*Developing solvent system:* Acetone, methanol, hydrochloric acid, and water (70:20:5:5)  
*Spray reagent:* Dissolve 850 mg of bismuth subnitrate in a mixture of 10 mL of glacial acetic acid and 40 mL of water. In a separate container, dissolve 20 g of potassium iodide in 50 mL of water. Mix the two solutions, and dilute with dilute sulfuric acid (1 in 10) to 500 mL. Add 7.5 g  $\pm$  2.5 g of iodine, and mix until the solution is complete.  
**Chromatographic plates:** Predevelop suitable thin-layer chromatographic plates by placing in a chromatographic chamber saturated with the *Developing solvent system*, and allow the *Developing solvent system* to move about 15 cm. Remove the plates from the chamber, dry at 105° for 15 min, and cool.

**Analysis 1 (3-quinuclidinyl benzilate):** Apply the *Standard solution* and the *Sample solution* to a *Chromatographic plate*. Place the plate in an unsaturated chromatographic chamber containing freshly prepared *Developing solvent system*, and allow the solvent front to move 10 cm. Remove the plate, dry at 105° for 10 min, cool, and spray with potassium iodoplatinate TS.

**Acceptance criteria 1:** The *Sample solution* shows no spot at an  $R_f$  value (about 0.8) corresponding to that of 3-quinuclidinyl benzilate.

**Analysis 2 (limit of clidinium bromide related compound A):** Apply the *Sample solution* and *Reference solution* to a second *Chromatographic plate*. Place the plate in an unsaturated chromatographic chamber containing freshly prepared *Developing solvent system*, and

allow the solvent front to move 15 cm. Remove the plate, dry at 105° for 10 min, cool, and spray with the *Spray reagent*.

**Acceptance criteria 2:** Any spot from the *Sample solution* at an  $R_f$  value of about 0.4 is not greater in size or intensity than the minor spot of the *Reference solution*: NMT 0.5% of clidinium bromide related compound A is found.

**SPECIFIC TESTS**

- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Clidinium Bromide RS  
USP Clidinium Bromide Related Compound A RS  
3-Hydroxy-1-methylquinuclidinium bromide.  
 $C_8H_{16}BrNO$  222.13

**Clindamycin Hydrochloride**

---

- $C_{18}H_{33}ClN_2O_5S \cdot HCl$  461.44  
 $C_{18}H_{33}ClN_2O_5S \cdot HCl \cdot H_2O$  479.47  
L-threo- $\alpha$ -D-galacto-Octopyranoside, methyl 7-chloro-6,7,8-trideoxy-6-[[[(1-methyl-4-propyl-2-pyrrolidinyl)-carbonyl]amino]-1-thio-, (2S-trans)-, monohydrochloride; Methyl 7-chloro-6,7,8-trideoxy-6-(1-methyl-trans-4-propyl-L-2-pyrrolidinecarboxamido)-1-thio-L-threo- $\alpha$ -D-galacto-octopyranoside monohydrochloride [21462-39-5]. Monohydrate [58207-19-5].

**DEFINITION**

Clindamycin Hydrochloride is the hydrated hydrochloride salt of clindamycin, a substance produced by the chlorination of lincomycin. It has a potency equivalent to NLT 800  $\mu$ g/mg of  $C_{18}H_{33}ClN_2O_5S$ .

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197M)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**  
*Buffer:* 6.8 g/L of monobasic potassium phosphate in water. Adjust with 8 N potassium hydroxide to a pH of 7.5.  
*Mobile phase:* Acetonitrile and *Buffer* (9:11)  
*Standard solution:* 1 mg/mL of USP Clindamycin Hydrochloride RS in *Mobile phase*  
*Sample solution:* 1 mg/mL of Clindamycin Hydrochloride in *Mobile phase*  
**Chromatographic system**  
(See *Chromatography* (621), *System Suitability*).  
*Mode:* LC  
*Detector:* UV 210 nm  
*Column:* 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

[NOTE—USP Clindamycin Hydrochloride RS contains clindamycin B and 7-epiclidamycin as minor components.]

**Resolution:** NLT 2.4 between clindamycin B and 7-epiclidamycin and NLT 3.0 between 7-epiclidamycin and clindamycin

**Tailing factor:** NMT 1.2 for the clindamycin peak

**Relative standard deviation:** NMT 1.0% for the clindamycin peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms for a period of time that is twice the retention time of the clindamycin peak.

Calculate the potency of  $C_{18}H_{33}ClN_2O_5S$ , in µg/mg, in the portion of Clindamycin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Clindamycin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Clindamycin Hydrochloride in the *Sample solution* (mg/mL)

$P$  = potency of clindamycin in USP Clindamycin Hydrochloride RS (µg/mg)

**Acceptance criteria:** NLT 800 µg/mg

**IMPURITIES**

**Organic Impurities**

• **PROCEDURE**

**Buffer and Mobile phase:** Prepare as directed in the Assay.

**Standard stock solution:** 0.5 mg/mL of USP Lincomycin Hydrochloride RS and 1 mg/mL of USP Clindamycin Hydrochloride RS in *Mobile phase*

**Standard solution:** 50 µg/mL of USP Lincomycin Hydrochloride RS and 100 µg/mL of USP Clindamycin Hydrochloride RS from *Standard stock solution* in *Mobile phase*

**Sample solution:** 5 mg/mL of Clindamycin Hydrochloride in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Record the chromatograms for a period of time that is six times the retention time of clindamycin.

Calculate the percentage of lincomycin in the portion of Clindamycin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of lincomycin from the *Sample solution*

$r_S$  = peak response of lincomycin from the *Standard solution*

$C_S$  = concentration of USP Lincomycin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Clindamycin Hydrochloride in the *Sample solution* (mg/mL)

$P$  = potency of USP Lincomycin Hydrochloride RS (µg/mg)

$F$  = conversion factor, 0.001 mg/µg

Calculate the percentage of all other related compounds in the portion of Clindamycin Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response of each individual related compound, other than lincomycin, from the *Sample solution*

$r_S$  = peak response of clindamycin from the *Standard solution*

$C_S$  = concentration of USP Clindamycin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

$P$  = potency of USP Clindamycin Hydrochloride RS (µg/mg)

$F$  = conversion factor, 0.001 mg/µg

**Acceptance criteria:** See *Table 1*.

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Lincomycin <sup>a</sup>	0.4	—
Clindamycin B	0.65	2.0
7-Epiclidamycin	0.8	4.0
Clindamycin	1.0	—
Any other individual related compound	—	1.0
Total related compounds <sup>b</sup>	—	6.0

<sup>a</sup> Lincomycin is controlled in the total of all related compounds. There is no individual acceptance criterion for this compound.

<sup>b</sup> Total of all related compounds including lincomycin.

**SPECIFIC TESTS**

• **CRYSTALLINITY** <695>: Meets the requirements

• **pH** <791>: 3.0–5.5, in a 100-mg/mL solution

• **WATER DETERMINATION, Method 1** <921>: 3.0%–6.0%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** <11>

USP Clindamycin Hydrochloride RS

L-threo-α-D-galacto-Octopyranoside, methyl 7-chloro-6,7,8-trideoxy-6-[[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-, (2S-trans)-, monohydrochloride.

$C_{18}H_{33}ClN_2O_5S \cdot HCl$  461.45

USP Lincomycin Hydrochloride RS

D-erythro-α-D-galacto-Octopyranoside, methyl 6,8-dideoxy-6-[[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-, monohydrochloride, monohydrate, (2S-trans)-.

$C_{18}H_{34}N_2O_6S \cdot HCl \cdot H_2O$  461.02

**Clindamycin Hydrochloride Capsules**

**DEFINITION**

Clindamycin Hydrochloride Capsules contain the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ).

**IDENTIFICATION**

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, relative to the internal standard, as obtained in the Assay.

**ASSAY****• PROCEDURE**

**Mobile phase:** Add 2 g of *dl*-10-camphorsulfonic acid, 1 g of ammonium acetate, and 1 mL of glacial acetic acid to 200 mL of water in a 500-mL volumetric flask, and mix to dissolve. Dilute with methanol to volume, and mix. Adjust, if necessary, with hydrochloric acid or a sodium hydroxide solution (1 in 2) to a pH of  $6.0 \pm 0.1$ .

**Internal standard solution:** Add 0.5 mL of phenylethyl alcohol to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Standard solution:** 18 mg/mL of USP Clindamycin Hydrochloride RS in *Internal standard solution*

**Sample solution:** Equivalent to 15 mg/mL of clindamycin, from the contents of NLT 20 Capsules, in *Internal standard solution*; shake for 30 min; centrifuge or filter, if necessary, to obtain a clear solution.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 4-mm  $\times$  30-cm stainless steel; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 25  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for the internal standard and clindamycin are 0.6 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 5.0 between the analyte and internal standard

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ) in the portion of Capsules taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times P \times F \times 100$$

$R_U$  = peak response ratio of clindamycin to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of clindamycin to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Clindamycin Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)

$P$  = potency of clindamycin in USP Clindamycin Hydrochloride RS ( $\mu$ g/mg)

$F$  = conversion factor, 0.001 mg/ $\mu$ g

**Acceptance criteria:** 90.0%–120.0%

**PERFORMANCE TESTS****• DISSOLUTION <711>**

**Medium:** pH 6.8 phosphate buffer (see *Reagents, Indicators, and Solutions—Buffer Solutions*); 900 mL

**Apparatus 1:** 100 rpm

**Time:** 30 min

**Mobile phase:** Dissolve 16 g of *dl*-10-camphorsulfonic acid, 8 g of ammonium acetate, and 8 mL of glacial acetic acid in 1600 mL of water. Add 2400 mL of methanol, and adjust with hydrochloric acid or 5 N sodium hydroxide to a pH of  $6.0 \pm 0.05$ .

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

**Standard solution:** Prepare a solution of USP Clindamycin Hydrochloride RS in *Medium* having a known concentration similar to that expected in the *Sample solution*.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 3- $\mu$ m packing L1

**Flow rate:** 2 mL/min

**Injection size:** 50  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.0%

**Analysis**

**Samples:** *Sample solution* and *Standard solution*

Calculate the amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ) dissolved.

**Tolerances:** NLT 80% (Q) of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

**SPECIFIC TESTS**

- **WATER DETERMINATION, Method I <921>:** NMT 7.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS <11>**

USP Clindamycin Hydrochloride RS

## Clindamycin Hydrochloride Oral Solution

---

**DEFINITION**

Clindamycin Hydrochloride Oral Solution contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ).

**IDENTIFICATION**

- **A.** The retention time of the clindamycin peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY****• PROCEDURE**

**Buffer:** 6.8 g/L of monobasic potassium phosphate in water. Adjust with 8 N potassium hydroxide to a pH of 7.5.

**Mobile phase:** Acetonitrile and *Buffer* (450:550). Increasing the proportion of acetonitrile in the *Mobile phase* decreases the retention time, and decreasing it increases the resolution between 7-epiclindamycin and clindamycin.

**Standard solution:** 1 mg/mL of USP Clindamycin Hydrochloride RS in *Mobile phase*

**Sample solution:** Equivalent to 0.85 mg/mL of clindamycin from Oral Solution in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.4 between the clindamycin B and 7-epiclindamycin peaks, and NLT 3.0 between the 7-epiclindamycin and clindamycin peaks

**Column efficiency:** NLT 4000 theoretical plates from the clindamycin peak

**Tailing factor:** NMT 1.2 for the clindamycin peak  
**Relative standard deviation:** NMT 1.0% for the clindamycin peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ) in each mL of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak area response from the *Sample solution*  
 $r_S$  = peak area response from the *Standard solution*  
 $C_S$  = concentration of USP Clindamycin Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)  
 $P$  = potency of clindamycin in USP Clindamycin Hydrochloride RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS** (905): Meets the requirements for solution packaged in single-unit containers
- **DELIVERABLE VOLUME** (698): Meets the requirements

**SPECIFIC TESTS**

- **pH** (791): 2.5–6.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **LABELING:** Label Oral Solution to indicate that it is intended for veterinary use only.
- **USP REFERENCE STANDARDS** (11)  
 USP Clindamycin Hydrochloride RS

## Clindamycin Palmitate Hydrochloride

$C_{34}H_{63}ClN_2O_6S \cdot HCl$  699.85  
 L-threo- $\alpha$ -D-galacto-Octopyranoside, methyl 7-chloro-6,7,8-trideoxy-6-[[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-2-hexadecanoate, monohydrochloride, (2S-trans)-;  
 Methyl 7-chloro-6,7,8-trideoxy-6-(1-methyl-trans-4-propyl-L-2-pyrrolidinecarboxamido)-1-thio-L-threo- $\alpha$ -D-galacto-octopyranoside 2-palmitate monohydrochloride [25507-04-4].

**DEFINITION**

Clindamycin Palmitate Hydrochloride has a potency equivalent to NLT 540  $\mu\text{g}$  of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ )/mg.

**IDENTIFICATION**

- **INFRARED ABSORPTION** (197M)

**ASSAY**• **PROCEDURE**

**Mobile phase:** Dissolve 2 g of docusate sodium and 1.54 g of ammonium acetate in a mixture of 2 mL of glacial acetic acid and 75 mL of water. Dilute with methanol to 1 L. Pass through a suitable filter, and degas.

**Standard solution:** 14 mg/mL of USP Clindamycin Palmitate Hydrochloride RS in *Mobile phase*

**Sample solution:** 14 mg/mL of Clindamycin Palmitate Hydrochloride in *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** Refractive index

**Column:** 3.9-mm  $\times$  30-cm; 10- $\mu\text{m}$  packing L1

**Flow rate:** 1.2 mL/min

**Injection size:** 20  $\mu\text{L}$

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the potency in  $\mu\text{g}/\text{mg}$  of  $C_{18}H_{33}ClN_2O_5S$  in the portion of Clindamycin Palmitate Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak response of clindamycin palmitate from the *Sample solution*  
 $r_S$  = peak response of clindamycin palmitate from the *Standard solution*  
 $C_S$  = concentration of USP Clindamycin Palmitate Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of Clindamycin Palmitate Hydrochloride in the *Sample solution* (mg/mL)  
 $P$  = potency of clindamycin in USP Clindamycin Palmitate Hydrochloride RS ( $\mu\text{g}/\text{mg}$ )

**Acceptance criteria:** NLT 540  $\mu\text{g}$

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.5%

**SPECIFIC TESTS**

- **pH** (791): 2.8–3.8, in a 10 mg/mL solution
- **WATER DETERMINATION, Method I** (921): NMT 3.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Clindamycin Palmitate Hydrochloride RS

## Clindamycin Palmitate Hydrochloride for Oral Solution

**DEFINITION**

Clindamycin Palmitate Hydrochloride for Oral Solution is a dry mixture of Clindamycin Palmitate Hydrochloride and one or more suitable buffers, colors, diluents, flavors, and preservatives. It contains the equivalent of NLT 90.0% and NMT 120.0% of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ), the labeled amount being 15 mg/mL when constituted as directed in the labeling.

**ASSAY**• **PROCEDURE**

**Solution A:** 300 mg/mL of sodium carbonate

**Internal standard solution:** 5 mg/mL of cholesteryl benzoate in chloroform

**Standard solution:** Transfer 150 mg of USP Clindamycin Palmitate Hydrochloride RS to a glass-stoppered, 15-mL conical centrifuge tube. Add 5 mL of water, 5.0 mL of *Internal standard solution*, and 1 mL of *Solution A*. Insert the stopper, shake vigorously for NLT 10 min, and cen-

trifuge. Remove the upper aqueous layer, and transfer 1.0 mL of the lower chloroform layer to a 15-mL centrifuge tube. Add 1.0 mL of pyridine and 1.0 mL of acetic anhydride. Agitate the tube to ensure complete mixing, cover the top of the centrifuge tube with a plastic cap through which a small hole has been punched, heat at 100° for 2.5 h, and allow to cool. Mix, and centrifuge if necessary. Use the clear solution.

**Sample solution:** Constitute the Clindamycin Palmitate Hydrochloride for Oral Solution as directed in the labeling, and transfer 5.0 mL of the constituted solution to a glass-stoppered, 15-mL conical centrifuge tube. Add 5.0 mL of *Internal standard solution* and 1 mL of *Solution A*. Insert the stopper, shake vigorously for NLT 10 min, and centrifuge. Remove the upper aqueous layer, and transfer 1.0 mL of the lower chloroform layer to a 15-mL centrifuge tube. Add 1.0 mL of pyridine and 1.0 mL of acetic anhydride. Agitate the tube to ensure complete mixing, cover the top of the centrifuge tube with a plastic cap through which a small hole has been punched, heat at 100° for 2.5 h, and allow to cool. Mix, and centrifuge if necessary. Use the clear solution.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.6-m × 3-mm glass; packing 1% phase G36 on support S1AB

**Temperature**

**Column:** 290°

**Detector:** 320°

**Carrier gas:** Dry helium

**Flow rate:** 60 mL/min

**Injection size:** 1.0 µL

#### System suitability

**Sample:** *Standard solution*

The elution order is: cholesteryl benzoate, clindamycin palmitate.

**Suitability requirements:** In a suitable chromatogram, the peaks are completely resolved.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of clindamycin (C<sub>18</sub>H<sub>33</sub>ClN<sub>2</sub>O<sub>5</sub>S) in each mL of the solution constituted from Clindamycin Palmitate Hydrochloride for Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times P \times 100$$

$R_U$  = internal standard ratio (peak response of clindamycin palmitate/peak response of cholesteryl benzoate) from the *Sample solution*

$R_S$  = internal standard ratio (peak response of clindamycin palmitate/peak response of cholesteryl benzoate) from the *Standard solution*

$C_S$  = concentration of USP Clindamycin Palmitate Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clindamycin palmitate hydrochloride in the *Sample solution* (mg/mL)

$P$  = potency of clindamycin in USP Clindamycin Palmitate Hydrochloride RS (µg/mg)

**Acceptance criteria:** 90.0%–120.0%

#### PERFORMANCE TESTS

##### • UNIFORMITY OF DOSAGE UNITS (905)

For solids packaged in single-unit containers: Meets the requirements

- **DELIVERABLE VOLUME** <698>: Meets the requirements

#### SPECIFIC TESTS

- **pH** <791>: 2.5–5.0, in the solution constituted as directed in the labeling
- **WATER DETERMINATION**, *Method I* <921>: NMT 3.0%

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>  
USP Clindamycin Palmitate Hydrochloride RS

### Clindamycin Phosphate

C<sub>18</sub>H<sub>34</sub>ClN<sub>2</sub>O<sub>8</sub>PS 504.96

*L-threo-α-D-galacto-Octopyranoside*, methyl 7-chloro-6,7,8-trideoxy-6-[[[(1-methyl-4-propyl-2-pyrrolidinyl)carbonyl]amino]-1-thio-, 2-(dihydrogen phosphate), (2*S-trans*)-.

Methyl 7-chloro-6,7,8-trideoxy-6-(1-methyl-*trans*-4-propyl-L-2-pyrrolidinecarboxamido)-1-thio-L-*threo-α-D-galacto*-octopyranoside 2-(dihydrogen phosphate) [24729-96-2].

» Clindamycin Phosphate has a potency equivalent to not less than 758 µg of clindamycin (C<sub>18</sub>H<sub>33</sub>ClN<sub>2</sub>O<sub>5</sub>S) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

#### USP Reference standards <11>—

USP Clindamycin Phosphate RS

USP Endotoxin RS

#### Identification, Infrared Absorption <197M>—

*Test specimen:* undried.

**Crystallinity** <695>: meets the requirements.

**pH** <791>: between 3.5 and 4.5, in a solution containing 10 mg per mL.

**Water**, *Method I* <921>: not more than 6.0%.

**Other requirements**—Where the label states that Clindamycin Phosphate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Clindamycin for Injection*. Where the label states that *Clindamycin Phosphate* must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Clindamycin for Injection*.

#### Assay—

**Buffer solution**—Add 14 mL of phosphoric acid to 4000 mL of HPLC grade water. Add 10 mL of ammonium hydroxide, and adjust with ammonium hydroxide to a pH of 3.90 ± 0.05.

**Organic solution**—Prepare a mixture of acetonitrile and methanol (900:100).

**Diluent**—Prepare a degassed mixture of *Buffer solution* and *Organic solution* (80:20).

**Solution A**—Prepare a degassed mixture of *Buffer solution* and *Organic solution* (920:80).

**Solution B**—Prepare a degassed mixture of *Buffer solution* and *Organic solution* (520:480).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Accurately weigh about 22 mg of USP Clindamycin Phosphate RS. Add 10.0 mL of *Diluent*, shake briefly, and sonicate for about 5 minutes to dissolve. Allow to cool to ambient temperature.

**Assay preparation**—Accurately weigh about 22 mg of Clindamycin Phosphate. Add 10.0 mL of *Diluent*, shake briefly, and sonicate for about 5 minutes to dissolve. Allow to cool to ambient temperature.

**Chromatographic system**—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.2 mL per minute. Maintain the column at a constant temperature of about 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	95.0	5.0	equilibrium
0–40	95.0→5.0	5.0→95.0	linear gradient
40–41	5.0→95.0	95.0→5.0	linear gradient
41–46	95.0	5.0	isocratic

Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the resolution between clindamycin phosphate and its nearest related compound is not less than 1.0, determined as follows. Between the peaks, draw a line perpendicular to the base line at the valley that separates the two peaks. The height of the valley from the base line is not more than 40 percent of the height of the related compound peak. Calculate the resolution, *R*, using peak widths at half height. The relative standard deviation determined from the clindamycin phosphate peak is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the clindamycin phosphate peaks. Calculate the quantity, in µg, of clindamycin (C<sub>18</sub>H<sub>33</sub>ClN<sub>2</sub>O<sub>5</sub>S) in the portion of Clindamycin Phosphate taken by the formula:

$$(PW_S / W_U)(r_U / r_S)$$

in which *P* is the potency, in µg of clindamycin per mg, of USP Clindamycin Phosphate RS; *W<sub>S</sub>* is the weight, in mg, of USP Clindamycin Phosphate RS taken to prepare the *Standard preparation*; *W<sub>U</sub>* is the weight, in mg, of Clindamycin Phosphate taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas for clindamycin phosphate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clindamycin Phosphate Vaginal Cream

### DEFINITION

Clindamycin Phosphate Vaginal Cream contains an amount of clindamycin phosphate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin (C<sub>18</sub>H<sub>33</sub>ClN<sub>2</sub>O<sub>5</sub>S).

### IDENTIFICATION

- A.** The relative retention time of the major peak for clindamycin phosphate of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Mobile phase:** Dissolve 10.54 g of monobasic potassium phosphate in 775 mL of water, and adjust with phos-

phoric acid to a pH of 2.5. Add 225 mL of acetonitrile, and mix.

**System suitability solution:** 0.6 mg/mL each of USP Clindamycin Phosphate RS and USP Clindamycin Hydrochloride RS in *Mobile phase*

**Standard solution:** 0.25 mg/mL of USP Clindamycin Phosphate RS in *Mobile phase*

**Sample solution:** Nominally 0.2 mg/mL of clindamycin in *Mobile phase* from Cream, prepared as follows. Transfer a suitable portion of Cream to a stoppered conical flask, and add *Mobile phase*. Add about 10 glass beads (about 10 mm in diameter). Insert the stopper securely in the flask, and shake by mechanical means at 50° for 1 h. Cool in an ice bath for 20 min, and centrifuge. Pass a portion of the cloudy lower layer through a filter of 2-µm or finer pore size, and use the filtrate.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for clindamycin phosphate and clindamycin are about 1.0 and 1.5, respectively.]

### Suitability requirements

**Resolution:** NLT 6.0 between clindamycin phosphate and clindamycin, *System suitability solution*

**Column efficiency:** NLT 1700 theoretical plates, *System suitability solution*

**Tailing factor:** NMT 1.3, *System suitability solution*

**Relative standard deviation:** NMT 2.5%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of clindamycin (C<sub>18</sub>H<sub>33</sub>ClN<sub>2</sub>O<sub>5</sub>S) in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

*r<sub>U</sub>* = peak response from the *Sample solution*

*r<sub>S</sub>* = peak response from the *Standard solution*

*C<sub>S</sub>* = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)

*C<sub>U</sub>* = nominal concentration of clindamycin in the *Sample solution* (mg/mL)

*P* = potency of clindamycin in USP Clindamycin Phosphate RS (µg/mg)

*F* = conversion factor, 0.001 mg/µg

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

- pH** <791>: 3.0–6.0, determined on the undiluted Cream

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers.
- USP REFERENCE STANDARDS** <11>  
USP Clindamycin Hydrochloride RS  
USP Clindamycin Phosphate RS

## Clindamycin Phosphate Gel

### DEFINITION

Clindamycin Phosphate Gel contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin (C<sub>18</sub>H<sub>33</sub>ClN<sub>2</sub>O<sub>5</sub>S).

**IDENTIFICATION**

- **A.** The retention time of the clindamycin phosphate peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Dissolve 10.54 g of monobasic potassium phosphate in 775 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 225 mL of acetonitrile, and mix.

**System suitability solution:** 0.6 mg/mL each of USP Clindamycin Phosphate RS and USP Clindamycin Hydrochloride RS in *Mobile phase*

**Standard solution:** 0.25 mg/mL of USP Clindamycin Phosphate RS in *Mobile phase*

**Sample solution:** Nominally 0.2 mg/mL of clindamycin in *Mobile phase* from Gel. Shake by mechanical means for 30 min. Centrifuge a portion of the solution, and if necessary, filter a portion of the supernatant. Use the clear filtrate.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for clindamycin phosphate and clindamycin are 1.0 and 1.5, respectively.]

**Suitability requirements**

**Resolution:** NLT 6.0 between the clindamycin phosphate and clindamycin peaks, *System suitability solution*

**Column efficiency:** NLT 1700 theoretical plates, *System suitability solution*  
Calculate as follows:

$$\text{Result} = (t_r/W_{h/2})^2 \times 5.545$$

$t_r$  = retention time

$W_{h/2}$  = peak width at half height

**Tailing factor:** NMT 1.3, *System suitability solution*

**Relative standard deviation:** NMT 2.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ) in the portion of Gel taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)

$P$  = potency of clindamycin in USP Clindamycin Phosphate RS (µg/mg)

$F$  = conversion factor, 0.001 mg/µg

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL** <755>: Meets the requirements

**SPECIFIC TESTS**

- **pH** <791>: 4.5–6.5

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.

- **USP REFERENCE STANDARDS** <11>  
USP Clindamycin Hydrochloride RS  
USP Clindamycin Phosphate RS

---

**Clindamycin Injection**

---

**DEFINITION**

Clindamycin Injection contains an amount of Clindamycin Phosphate in Water for Injection equivalent to NLT 90.0% and NMT 120.0% of the labeled amount of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ). It may be frozen.

**IDENTIFICATION**

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Mobile phase:** Dissolve 10.54 g of monobasic potassium phosphate in 775 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 225 mL of acetonitrile, mix, and filter. Ensure that the concentration of acetonitrile in the *Mobile phase* is NLT 22% and NMT 25% to retain the correct elution order.

**System suitability stock solution:** 0.1 mg/mL of USP Benzyl Alcohol RS in *Mobile phase*

**System suitability solution:** 25 µg/mL of USP Benzyl Alcohol RS from *System suitability stock solution* and 0.25 mg/mL of USP Clindamycin Phosphate RS, in *Mobile phase*

**Standard solution:** 0.24 mg/mL of USP Clindamycin Phosphate RS in *Mobile phase*

**Sample stock solution:** Nominally 3 mg/mL of clindamycin from Injection in *Mobile phase*

**Sample solution:** 0.21 mg/mL of clindamycin from *Sample stock solution* in *Mobile phase*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for clindamycin phosphate and benzyl alcohol are 1.0 and 1.2, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.0 between clindamycin phosphate and benzyl alcohol, *System suitability solution*

**Relative standard deviation:** NMT 2.5, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ) in the portion of the Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response of clindamycin phosphate from the *Sample solution*  
 $r_S$  = peak response of clindamycin phosphate from the *Standard solution*  
 $C_S$  = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)  
 $P$  = potency of clindamycin in USP Clindamycin Phosphate RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
**Acceptance criteria:** 90.0%–120.0%

**SPECIFIC TESTS**

- **PH** (791): 5.5–7.0
- **BACTERIAL ENDOTOXINS TEST** (85): NMT 0.58 USP Endotoxin Unit/mg of clindamycin
- **PARTICULATE MATTER IN INJECTIONS** (788): Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections* (1)

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I glass, or in suitable plastic containers.
- **LABELING:** Meets the requirements in *Injections* (1), *Labeling*. Where it is maintained in the frozen state, the label states that it is to be thawed just before use, describes the conditions for proper storage of the resultant solution, and directs that the solution is not to be refrozen.

## Clindamycin for Injection

**DEFINITION**

Clindamycin for Injection contains an amount of Clindamycin Phosphate equivalent to NLT 758  $\mu\text{g}/\text{mg}$  of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ), calculated on the anhydrous basis.

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197M)  
 Sample: Undried specimen  
 Acceptance criteria: Meets the requirements

**ASSAY****PROCEDURE**

**Buffer:** Add 14 mL of phosphoric acid to 4000 mL of HPLC grade water. Add 10 mL of ammonium hydroxide, and adjust with ammonium hydroxide to a pH of  $3.90 \pm 0.05$ .

**Solution A:** Acetonitrile and methanol (9:1)

**Diluent:** *Solution A* and *Buffer* (1:4)

**Solution B:** *Solution A* and *Buffer* (2:23)

**Solution C:** *Solution A* and *Buffer* (12:13)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution B (%)	Solution C (%)
0	95	5
40	5	95
41	95	5
46	95	5

**Standard solution:** 2.2 mg/mL of USP Clindamycin Phosphate RS in *Diluent*, prepared as follows. Shake

briefly, and sonicate for 5 min to dissolve. Allow to cool to ambient temperature.

**Sample solution:** Nominally 2.2 mg/mL of clindamycin phosphate in *Diluent* from Clindamycin for Injection, prepared as follows. Shake briefly, and sonicate for 5 min to dissolve. Allow to cool to ambient temperature.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 214 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L7

**Column temperature:** 40°

**Flow rate:** 1.2 mL/min

**Injection volume:** 25  $\mu\text{L}$

**System suitability**

**Sample:** *Standard solution*

**Suitability requirements**

**Resolution:** NLT 1.0 between clindamycin phosphate and its nearest related compound. Calculate the resolution using peak widths at half height.

**Peak-to-valley ratio:** NLT 2.5

Calculate the peak-to-valley ratio:

$$\text{Result} = H_p/H_v$$

$H_p$  = height above the baseline of the nearest related compound peak

$H_v$  = height above the baseline of the valley between clindamycin phosphate and its nearest related compound

**Relative standard deviation:** NMT 2.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the quantity of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ), in  $\mu\text{g}/\text{mg}$ , in the portion of Clindamycin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P$$

$r_U$  = peak area from the *Sample solution*

$r_S$  = peak area from the *Standard solution*

$C_S$  = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clindamycin phosphate in the *Sample solution* (mg/mL)

$P$  = potency of clindamycin in the USP Clindamycin Phosphate RS ( $\mu\text{g}/\text{mg}$ )

**Acceptance criteria:** NLT 758  $\mu\text{g}/\text{mg}$  on the anhydrous basis

**SPECIFIC TESTS**

- **BACTERIAL ENDOTOXINS TEST** (85): Contains NMT 0.58 USP Endotoxin Unit/mg of clindamycin
- **STERILITY TESTS** (71)  
 Sample solution: 6 g of Clindamycin for Injection aseptically dissolved in 200 mL of *Fluid A*  
 Acceptance criteria: Meets the requirements when tested as directed in *Test for Sterility of the Product to Be Examined, Membrane Filtration*
- **PH** (791)  
 Sample solution: Nominally 10 mg/mL of clindamycin in water from Clindamycin for Injection  
 Acceptance criteria: 3.5–4.5
- **WATER DETERMINATION, Method I** (921): NMT 6.0%
- **CRYSTALLINITY** (695): Meets the requirements
- **OTHER REQUIREMENTS:** It responds to the *Identification* test in *Clindamycin Phosphate*.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve as described in *Injections* (1), *Containers for Sterile Solids*.

- **USP REFERENCE STANDARDS** <11>  
USP Clindamycin Phosphate RS  
USP Endotoxin RS

## Clindamycin Phosphate Topical Solution

### DEFINITION

Clindamycin Phosphate Topical Solution contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Dissolve 10.54 g of monobasic potassium phosphate in 775 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 225 mL of acetonitrile, mix, and filter. Ensure that the concentration of acetonitrile in the *Mobile phase* is NLT 22% and NMT 25% to retain the correct elution order.

**System suitability stock solution 1:** 4 mg/mL of 4'-hydroxyacetophenone in acetonitrile

**System suitability stock solution 2:** 0.04 mg/mL of 4'-hydroxyacetophenone from *System suitability stock solution 1* in *Mobile phase*

**Standard solution:** 0.24 mg/mL of USP Clindamycin Phosphate RS in *Mobile phase*

**System suitability solution:** Mix 1 part of *System suitability stock solution 2* with 3 parts of *Standard solution*.

**Sample solution:** Equivalent to 0.2 mg/mL of clindamycin from Topical Solution in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for clindamycin phosphate and 4'-hydroxyacetophenone are about 1.0 and 1.2, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between clindamycin phosphate and 4'-hydroxyacetophenone, *System suitability solution*

**Relative standard deviation:** NMT 2.5%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ) in the portion of the Topical Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)  
 $P$  = potency of clindamycin in USP Clindamycin Phosphate RS (µg/mg)  
 $F$  = conversion factor, 0.001 mg/µg

Acceptance criteria: 90.0%–110.0%

### SPECIFIC TESTS

- **pH** <791>: 4.0–7.0

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** <11>  
USP Clindamycin Phosphate RS

## Clindamycin Phosphate Topical Suspension

### DEFINITION

Clindamycin Phosphate Topical Suspension contains the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Dissolve 10.54 g of monobasic potassium phosphate in 775 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 225 mL of acetonitrile, mix, and filter.

**System suitability solution:** 0.6 mg/mL each of USP Clindamycin Phosphate RS and USP Clindamycin Hydrochloride RS, in the *Mobile phase*

**Standard solution:** 0.25 mg/mL of USP Clindamycin Phosphate RS in the *Mobile phase*

**Sample solution:** Equivalent to 0.2 mg/mL of clindamycin from Topical Suspension in *Mobile phase*. Prepare as follows. Using a suitable hypodermic needle and syringe, transfer a suitable aliquot of Topical Suspension to a suitable volumetric flask, dilute with *Mobile phase* to volume, and mix.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 20 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for clindamycin phosphate and clindamycin are about 1.0 and 1.5, respectively.]

#### Suitability requirements

**Resolution:** NLT 6.0 between the clindamycin phosphate and clindamycin peaks, *System suitability solution*

**Column efficiency:** NLT 1700 theoretical plates, *System suitability solution*, calculated from the peak width at half height

**Tailing factor:** NMT 1.3, *System suitability solution*

**Relative standard deviation:** NMT 2.5%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of the labeled amount of clindamycin ( $C_{18}H_{33}ClN_2O_5S$ ) in the portion of the Topical Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times P \times F \times 100$$

- $r_U$  = peak response from the *Sample solution*

- $r_s$  = peak response from the *Standard solution*  
 $C_s$  = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)  
 $C_u$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)  
 $P$  = potency of clindamycin in USP Clindamycin Phosphate RS ( $\mu\text{g}/\text{mg}$ )  
 $F$  = conversion factor, 0.001 mg/ $\mu\text{g}$   
**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL** (755): Meets the requirements

**SPECIFIC TESTS**

- **PH** (791): 4.5–6.5

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Clindamycin Hydrochloride RS  
 USP Clindamycin Phosphate RS

## Clindamycin Phosphate Vaginal Inserts

**DEFINITION**

Clindamycin Phosphate Vaginal Inserts contain the equivalent of NLT 90.0% and NMT 110.0% of the labeled amount of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197M)

**Sample:** Transfer a Vaginal Insert into a suitable container, add 120 mL of methylene chloride, insert a stopper, and shake until the Vaginal Insert is completely dissolved. Using a vacuum, pass through a methylene chloride-compatible filter having a 0.45- $\mu\text{m}$  pore size. Rinse the filter with several portions of methylene chloride, and allow the filter to air-dry. Use the white residue to prepare the mineral oil dispersion for the test.

**Acceptance criteria:** The IR absorption of the *Sample* exhibits maxima at the same wavelengths as that of a similar preparation of USP Clindamycin Phosphate RS.

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

- **PROCEDURE**

**Buffer:** 10.54 g/L of monobasic potassium phosphate in water. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase:** Dissolve 10.54 g of monobasic potassium phosphate in 775 mL of water, and adjust with phosphoric acid to a pH of 2.5. Add 225 mL of acetonitrile, and mix.

**System suitability solution:** 0.24 mg/mL of USP Clindamycin Phosphate RS and 6  $\mu\text{g}/\text{mL}$  of USP Clindamycin Hydrochloride RS, in *Buffer*

**Standard solution:** 0.24 mg/mL of USP Clindamycin Phosphate RS in *Buffer*

**Sample solution:** Transfer 1 Vaginal Insert to a suitable 100-mL container. Add 40 mL of isooctane, and seal the container tightly with a teflon-lined septum and crimp cap. Shake vigorously for about 15 min until all of the Vaginal Insert is dissolved. Add 40.0 mL of *Buffer*. Recap the container tightly, and shake vigorously for NLT 30 min, taking care to avoid leakage. Allow the layers to separate, and remove a volume of the lower aqueous layer sufficient to perform the following steps. Pass the aqueous solution through a filter having a 5- $\mu\text{m}$  or finer pore size, discarding the first 2 mL of the filtrate. Collect the remaining filtrate, and prepare a solution equivalent to 0.2 mg/mL of clindamycin with *Buffer*.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm  $\times$  25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 35  $\mu\text{L}$

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 2.0 between clindamycin phosphate and clindamycin hydrochloride, *System suitability solution*

Calculate as follows.

$$\text{Result} = [(t_2 - t_1)/(w_{h1} + w_{h2})] \times 1.177$$

$t_2$  = retention time of the second peak

$t_1$  = retention time of the first peak

$w_{h1}$  = height at half width of the first peak

$w_{h2}$  = height at half width of the second peak

**Relative standard deviation:** NMT 2.5%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of clindamycin ( $\text{C}_{18}\text{H}_{33}\text{ClN}_2\text{O}_5\text{S}$ ) equivalent in the Vaginal Insert taken:

$$\text{Result} = (r_u/r_s) \times (C_s/C_u) \times P \times F \times 100$$

$r_u$  = peak response from the *Sample solution*

$r_s$  = peak response from the *Standard solution*

$C_s$  = concentration of USP Clindamycin Phosphate RS in the *Standard solution* (mg/mL)

$C_u$  = nominal concentration of clindamycin in the *Sample solution* (mg/mL)

$P$  = potency of clindamycin in the USP Clindamycin Phosphate RS ( $\mu\text{g}/\text{mg}$ )

$F$  = conversion factor, 0.001 mg/ $\mu\text{g}$

**Acceptance criteria:** 90.0%–110.0%. Use as the *Assay* value the average of the determinations obtained in the test for *Uniformity of Dosage Units* (905), *Content Uniformity*.

**PERFORMANCE TESTS**

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers, at controlled room temperature, or in a cool place.
- **USP REFERENCE STANDARDS** (11)  
 USP Clindamycin Hydrochloride RS  
 USP Clindamycin Phosphate RS

## Clioquinol

$\text{C}_9\text{H}_5\text{ClINO}$  305.50

8-Quinololinol, 5-chloro-7-iodo-

5-Chloro-7-iodo-8-quinolinol [130-26-7].

» Clioquinol, dried over phosphorus pentoxide for 5 hours, contains not less than 93.0 percent

and not more than 100.5 percent of  $C_9H_5ClINO$  (the 5-chloro-7-iodo-8-quinolinol isomer).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Clioquinol RS

**Identification**—

**A:** Prepare a Standard solution as directed for *Standard preparation* in the *Assay*, except to use 1.0 mL of pyridine instead of the *Internal standard solution*, and chromatograph as directed in the *Assay*: the chromatogram of the *Assay preparation* obtained in the *Assay* exhibits a peak for clioquinol, the retention time of which corresponds with that exhibited by the Standard solution.

**B: Ultraviolet Absorption** (197U)—

*Solution:* 5 µg per mL.

*Medium:* 3 N hydrochloric acid.

Absorptivities at 267 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** Heat 100 mg with 5 mL of sulfuric acid: copious violet vapors of iodine are evolved.

**Loss on drying** (731)—Dry it over phosphorus pentoxide for 5 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Free iodine and iodide**—Shake 1.0 g with 20 mL of water for 30 seconds, allow to stand for 5 minutes, and filter. To 10 mL of the filtrate add 1 mL of 2 N sulfuric acid, then add 2 mL of chloroform, and shake: no violet color appears in the chloroform (*free iodine*). To the mixture add 5 mL of 2 N sulfuric acid and 1 mL of potassium dichromate TS, and shake for 15 seconds: the color in the chloroform layer is no deeper than that produced in a control test made in the following manner: Dilute 2.0 mL of potassium iodide solution (1 in 6000) with water to 10 mL, add 6 mL of 2 N sulfuric acid, 1 mL of potassium dichromate TS, and 2 mL of chloroform, and shake for 15 seconds (0.05% of iodide).

**Assay**—

*Internal standard solution*—Prepare a solution of pyrene in pyridine containing 2 mg per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Clioquinol RS in a mixture of pyridine and *n*-hexane (4:1) to obtain a Standard solution having a known concentration of about 3 mg per mL. Transfer 1.0 mL of the Standard solution to a screw-capped glass vial fitted with a septum, add 1.0 mL of bis(trimethylsilyl)acetamide and 1.0 mL of *Internal standard solution*, attach the cap, and mix. Heat in a water bath at 50° for 15 minutes, and then cool to ambient temperature.

*Assay preparation*—Transfer about 75 mg of Clioquinol, previously dried and accurately weighed, to a 25-mL volumetric flask, dissolve in a mixture of pyridine and *n*-hexane (4:1), dilute with the same solvent to volume, and mix. Transfer 1.0 mL of this solution to a screw-capped glass vial fitted with a septum, add 1.0 mL of bis(trimethylsilyl)acetamide and 1.0 mL of *Internal standard solution*, attach the cap, and mix. Heat in a water bath at 50° for 15 minutes, then cool to ambient temperature.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector, and contains a 1.83-m × 2-mm glass column packed with 3% liquid phase G3 on 80- to 100-mesh support S1AB. The injection port and detector temperatures are maintained at 170° and 250°, respectively, and the initial column temperature is 200° for a conditioning period of not less than 16 hours (not connected to the detector) and is then reduced to 165°. Helium is used as the carrier gas at a flow rate of about 30 mL per minute, and hydrogen and air are introduced into the detector at rates of 25 mL and 500 mL per minute, respectively. Chromatograph the *Standard preparation*, and record the peak responses as directed under

*Procedure*: the resolution,  $R$ , between the clioquinol and the internal standard peaks is not less than 3.

*Procedure*—Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times for clioquinol and pyrene are about 0.6 and 1.0, respectively. Calculate the quantity, in mg, of  $C_9H_5ClINO$  in the Clioquinol taken by the formula:

$$25C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Clioquinol RS in the Standard solution used to prepare the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the clioquinol peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clioquinol Cream

» Clioquinol Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_9H_5ClINO$  in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes or tight, light-resistant containers.

**USP Reference standards** (11)—

USP Clioquinol RS

**Identification**—

**A:** Prepare a Standard solution as directed for *Standard preparation* in the *Assay*, except to use 1.0 mL of pyridine instead of the *Internal standard solution*, and chromatograph as directed in the *Assay*: the chromatogram of the *Assay preparation* obtained in the *Assay* exhibits a peak for clioquinol, the retention time of which corresponds with that exhibited by the Standard solution.

**B:** Place a quantity of Cream, equivalent to about 25 mg of clioquinol, in a 100-mL volumetric flask, add about 75 mL of dilute hydrochloric acid (1 in 4), and heat on a steam bath to melt the cream, shaking vigorously to extract the clioquinol. Cool under running water, and add dilute hydrochloric acid (1 in 4) to volume. Filter through paper, and dilute 3 mL of the filtrate with dilute hydrochloric acid (1 in 4) to 100 mL: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Clioquinol RS, concomitantly measured.

**Assay**—

*Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under Clioquinol.

*Assay preparation*—Transfer an accurately weighed portion of Cream, equivalent to about 150 mg of clioquinol, to a 60-mL separator. Place the separator on its side in a vacuum oven at a pressure of about 10 mm of mercury at 45° for 4 hours. Remove the separator from the oven, allow to cool, add 15 mL of a mixture of pyridine and *n*-hexane (4:1), insert a polytef stopper, and mix. Transfer the mixture to a 50-mL volumetric flask, and rinse the separator with two 15-mL portions of the same solvent, shaking each time for 30 seconds. Transfer both rinsings to the volumetric flask, dilute with the same solvent to volume, and mix. Transfer 1.0 mL to a screw-capped glass vial fitted with a septum, add 1.0 mL of bis(trimethylsilyl)acetamide and 1.0 mL of *Internal standard solution*, attach the cap, and mix. Heat in a water bath at 50° for 15 minutes, and then cool to ambient temperature.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Clioquinol*. Calculate the quantity, in mg, of  $C_9H_5ClINO$  in the portion of Cream taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Clioquinol RS in the Standard solution used to prepare the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the clioquinol peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clioquinol Ointment

» Clioquinol Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_9H_5ClINO$  in a suitable ointment base.

**Packaging and storage**—Preserve in collapsible tubes or tight, light-resistant containers.

**USP Reference standards** {11}—

USP Clioquinol RS

**Identification**—It responds to the *Identification* tests under *Clioquinol Cream*.

**Assay**—

*Internal standard solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Clioquinol*.

*Assay preparation*—Transfer an accurately weighed portion of Ointment, equivalent to about 150 mg of clioquinol, to a 125-mL separator. Add 75 mL of *n*-hexane, and mix. Add 15 mL of dimethylformamide, and mix for 1 minute. Allow the layers to separate, and transfer the lower layer to a 50-mL volumetric flask. Repeat the extraction with separate 15-mL and 10-mL portions of dimethylformamide, and transfer the lower layers to the 50-mL volumetric flask. Dilute with dimethylformamide to volume, and mix. Transfer 1.0 mL of this solution to a screw-capped glass vial fitted with a septum, and evaporate at about 60° under a stream of nitrogen to dryness. Add 1.0 mL of a mixture of pyridine and *n*-hexane (4:1) to the residue, add 1.0 mL of bis(trimethylsilyl)acetamide and 1.0 mL of *Internal standard solution*, attach the cap, and mix. Heat in a water bath at 50° for 15 minutes, then cool to ambient temperature.

*Procedure*—Proceed as directed for *Procedure* under *Clioquinol*. Calculate the quantity, in mg, of  $C_9H_5ClINO$  in the portion of Ointment taken by the formula:

$$50C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Clioquinol RS in the Standard solution used to prepare the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the clioquinol peak to the internal standard peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Compound Clioquinol Topical Powder

» Compound Clioquinol Topical Powder contains not less than 22.5 percent and not more than 27.5 percent of  $C_9H_5ClINO$ .

Clioquinol	250 g
Lactic Acid	25 g
Zinc Stearate	200 g
Lactose	525 g
To make	1000 g

Mix the Lactic Acid with the Lactose, then add the Clioquinol and the Zinc Stearate, and mix.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** {11}—

USP Clioquinol RS

**Identification**—Place a quantity of Topical Powder, equivalent to about 30 mg of clioquinol, in a glass-stoppered, 50-mL conical flask, add 20 mL of 1 N sulfuric acid, and shake for 5 minutes. Filter, transfer 5 mL of the filtrate to a glass-stoppered test tube, add 5 drops of potassium dichromate TS and 2 mL of chloroform, and shake well: a red-violet color develops in the chloroform layer.

**Assay**—Transfer an accurately weighed quantity of Topical Powder, equivalent to about 50 mg of clioquinol, to a 200-mL volumetric flask, add 100 mL of 3 N hydrochloric acid, and shake by mechanical means for 15 minutes. Dilute with 3 N hydrochloric acid to volume, and mix. Filter a portion of the solution, dilute 4.0 mL of the filtrate with 3 N hydrochloric acid to 200.0 mL, and mix. Concomitantly determine the absorbances of this solution and of a Standard solution of USP Clioquinol RS in the same medium having a known concentration of about 5 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 267 nm, with a suitable spectrophotometer, using 3 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_9H_5ClINO$  in the portion of Topical Powder taken by the formula:

$$10C(A_U / A_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Clioquinol RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Topical Powder and the Standard solution, respectively.

## Clioquinol and Hydrocortisone Cream

» Clioquinol and Hydrocortisone Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of clioquinol ( $C_9H_5ClINO$ ) and of hydrocortisone ( $C_{21}H_{30}O_5$ ) in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes or in tight, light-resistant containers.

**USP Reference standards** {11}—

USP Clioquinol RS

USP Hydrocortisone RS

**Identification**—

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay for clioquinol* exhibits a peak for clioquinol, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay for hydrocortisone* exhibits a peak for hydrocortisone, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**Minimum fill** (755): meets the requirements.

#### Assay for clioquinol—

*Internal standard solution*—Prepare a solution of pyrene in pyridine containing about 2 mg per mL.

*Standard solution*—Transfer about 75 mg of USP Clioquinol RS to a 25-mL volumetric flask, add a mixture of pyridine and hexane (4:1) to volume, and mix to obtain a *Standard solution* having a known concentration of about 3 mg of USP Clioquinol RS per mL.

*Standard preparation*—Transfer 1.0 mL of *Standard solution*, 1.0 mL of *N,O*-bis(trimethylsilyl)acetamide and 1.0 mL of *Internal standard solution* to a suitable screw-capped glass vial, fitted with a polytef-lined septum, and mix. Heat on a water bath at 50° for 15 minutes, and cool to room temperature.

*Assay preparation*—Transfer an accurately weighed quantity of Cream, equivalent to about 150 mg of clioquinol, to a 60-mL separator. Place the separator on its side in a vacuum oven at about 45° for 4 hours. Remove the separator, cool to room temperature, and add 15.0 mL of a mixture of pyridine and hexane (4:1). Insert the stopper in the separator, and mix until the specimen is completely dispersed. Quantitatively transfer the contents of the separator to a 50-mL volumetric flask, rinse the separator with two 15-mL portions of a mixture of pyridine and hexane (4:1), collecting the rinsings in the volumetric flask, dilute with the same solvent mixture to volume, and mix. Immediately transfer 1 mL of this solution to a dry, screw-capped glass vial, and evaporate with the aid of gentle heat and a stream of nitrogen to dryness. Dissolve the residue in 1.0 mL of a mixture of pyridine and hexane (4:1), add 1 mL each of *N,O*-bis(trimethylsilyl)acetamide and *Internal standard solution* to the screw-capped glass vial, fitted with a polytef-lined septum, and mix. Heat on a water bath at 50° for 15 minutes, and cool to room temperature.

*Chromatographic system* (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm × 1.8-m column packed with 3% liquid phase G3 on 80- to 100-mesh support SIAB. The column, injection port, and detector block temperatures are maintained at 165°, 170°, and 250°, respectively. Dry helium is used as the carrier gas at a flow rate of about 30 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for clioquinol and 1.0 for pyrene; the resolution, *R*, between the analyte and internal standard peaks is not less than 3.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Inject equal volumes (about 1 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms so as to obtain not less than 40% of maximum recorder response, and measure the peak response of each component. Calculate the quantity, in mg, of C<sub>9</sub>H<sub>5</sub>ClINO in the portion of Cream taken by the formula:

$$150C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Clioquinol RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for hydrocortisone—

*Mobile phase*—Prepare a filtered and degassed solution of water, acetonitrile, and methanol (2.75:1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Hydrocortisone RS in alcohol to obtain a solution having a known concentration of about 1 mg per mL (*Solution A*). Pipet 1 mL of this solution into a 10-mL

volumetric flask, dilute with alcohol to volume, and mix to obtain a solution having a known concentration of about 100 µg of USP Hydrocortisone RS per mL.

*Resolution solution*—Dissolve an accurately weighed quantity of methylparaben in alcohol to obtain a solution having a known concentration of about 0.5 mg of methylparaben per mL. Pipet 2 mL of this solution and 20 mL of *Solution A* into a 200-mL volumetric flask, dilute with alcohol to volume, and mix.

*Assay preparation*—Transfer an accurately weighed quantity of Cream, equivalent to about 10 mg of hydrocortisone, to a 50-mL centrifuge tube. Add 30 mL of alcohol and heat on a steam bath just to boiling. Shake for 15 minutes and centrifuge. Quantitatively transfer the supernatant extract to a 100-mL volumetric flask. Repeat the extraction with two 20-mL portions of alcohol, combining the extracts in the 100-mL volumetric flask. Add alcohol to volume, mix, and filter.

*Chromatographic system*—(see *Chromatography* <621>). The liquid chromatograph is equipped with a 254-nm detector, a 3.9-mm × 30-cm column that contains packing L1, and a guard column that contains packing L2. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for methylparaben and 1.0 for hydrocortisone; the resolution, *R*, between the hydrocortisone and methylparaben peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>21</sub>H<sub>30</sub>O<sub>5</sub> in the portion of Cream taken by the formula:

$$0.1C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Hydrocortisone RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clioquinol and Hydrocortisone Ointment

» Clioquinol and Hydrocortisone Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of clioquinol (C<sub>9</sub>H<sub>5</sub>ClINO) and of hydrocortisone (C<sub>21</sub>H<sub>30</sub>O<sub>5</sub>) in a suitable ointment base.

**Packaging and storage**—Preserve in collapsible tubes or in tight, light-resistant containers.

#### USP Reference standards <11>—

USP Clioquinol RS

USP Hydrocortisone RS

#### Identification—

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay for clioquinol* exhibits a peak for clioquinol, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay for hydrocortisone* exhibits a peak for hydrocortisone, the retention time of which corresponds to that exhibited by the *Standard preparation*.

**Minimum fill** (755): meets the requirements.

#### Assay for clioquinol—

*Internal standard solution, Standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the Assay for clioquinol under Clioquinol and Hydrocortisone Cream.

*Assay preparation*—Transfer an accurately weighed quantity of Ointment, equivalent to about 150 mg of clioquinol, to a 125-mL separator. Add 75 mL of *n*-hexane, insert the stopper in the separator, and mix until the specimen is completely dispersed. Extract with 25 mL of dimethylformamide, collecting the extract in a 50-mL volumetric flask. Repeat the extraction with two 10-mL portions of dimethylformamide, collecting the extracts in the 50-mL volumetric flask, dilute with dimethylformamide to volume, and mix. Transfer 1.0 mL of this solution to a suitable size screw-capped vial, and evaporate the solution with the aid of nitrogen at about 60° to dryness. Dissolve the residue in 1.0 mL of a mixture of pyridine and hexane (4:1), and pipet 1.0 mL of *N,O*-bis(trimethylsilyl)acetamide and 1.0 mL of *Internal standard solution* into the glass vial, fitted with a polytetrafluoroethylene-lined septum, securely close, and mix. Heat the vial on a water bath at 50° for 15 minutes, and cool to room temperature.

*Procedure*—Proceed as directed for *Procedure* in the Assay for clioquinol under Clioquinol and Hydrocortisone Cream. Calculate the quantity, in mg, of  $C_9H_5ClINO$  in the portion of Ointment taken by the formula:

$$150C(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of USP Clioquinol RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

#### Assay for hydrocortisone—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the Assay for hydrocortisone under Clioquinol and Hydrocortisone Cream.

*Assay preparation*—Transfer an accurately weighed quantity of Ointment, equivalent to about 10 mg of hydrocortisone, to a 50-mL centrifuge tube. Add 30 mL of alcohol and heat on a steam bath just to boiling. Shake for 15 minutes, and centrifuge. Quantitatively transfer the supernatant extract to a 100-mL volumetric flask. Repeat the extraction with two 20-mL portions of alcohol, combining the extracts in the 100-mL volumetric flask. Add alcohol to volume, mix, and filter.

*Procedure*—Proceed as directed for *Procedure* in the Assay for hydrocortisone under Clioquinol and Hydrocortisone Cream. Calculate the quantity, in mg, of  $C_{21}H_{30}O_5$  in the portion of Ointment taken by the formula:

$$0.1C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Hydrocortisone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clobetasol Propionate

$C_{25}H_{32}ClFO_5$  466.97  
Pregna-1,4-diene-3,20-dione, 21-chloro-9-fluoro-11-hydroxy-16-methyl-17-(1-oxopropoxy)-, (11β,16β)-; 21-Chloro-9-fluoro-11β,17-dihydroxy-16β-methylpregna-1,4-diene-3,20-dione 17-propionate [25122-46-7; 25122-41-2].

#### DEFINITION

Clobetasol Propionate contains NLT 97.0% and NMT 102.0% of  $C_{25}H_{32}ClFO_5$ , calculated on the dried basis.

#### IDENTIFICATION

- **INFRARED ABSORPTION** (197M)

#### ASSAY

##### • PROCEDURE

**Solution A:** 0.05 M monobasic sodium phosphate. Adjust with 85% phosphoric acid to a pH of 2.5.

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (19:4:17)

**Internal standard solution:** 0.2 mg/mL of beclomethasone dipropionate in methanol

**Standard solution:** Dissolve a quantity of USP Clobetasol Propionate RS in methanol and *Internal standard solution* to obtain a final solution of 0.04 mg/mL of USP Clobetasol Propionate RS and 0.08 mg/mL of beclomethasone dipropionate.

**System suitability solution:** 0.001 mg/mL of USP Clobetasol Propionate Related Compound A RS and 0.1 mg/mL of USP Clobetasol Propionate RS in *Mobile phase*

**Sample solution:** Transfer 4 mg of Clobetasol Propionate to a 100-mL volumetric flask, add 40.0 mL of *Internal standard solution*, and dilute with methanol to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for clobetasol propionate and clobetasol propionate related compound A are 1.0 and 1.1, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between clobetasol propionate and clobetasol propionate related compound A

**Column efficiency:** NLT 5000 theoretical plates for the clobetasol peak

**Tailing factor:** NMT 2.0 for the clobetasol peak

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for clobetasol propionate and beclomethasone dipropionate are 1.0 and 1.6, respectively.]

Calculate the percentage of  $C_{25}H_{32}ClFO_5$  in the portion of Clobetasol Propionate taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Sample solution*
- $R_S$  = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Standard solution*
- $C_S$  = concentration of USP Clobetasol Propionate RS in the *Standard solution* (mg/mL)
- $C_U$  = nominal concentration of clobetasol propionate in the *Sample solution* (mg/mL)
- Acceptance criteria:** 97.0%–102.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

- **RESIDUE ON IGNITION** (281): NMT 0.1%, using a platinum crucible
- **HEAVY METALS, Method II** (231): NMT 20 ppm

**Organic Impurities****• PROCEDURE**

**Solution A, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the Assay.

**Sample solution:** 0.1 mg/mL of Clobetasol Propionate in *Mobile phase*

**Analysis**

**Sample:** *Sample solution*

Calculate the percentage of each impurity in the portion of Clobetasol Propionate taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak area for each impurity

$r_T$  = sum of the areas of all of the peaks

**Acceptance criteria**

**Any individual impurity:** NMT 1.0%

**Total impurities:** NMT 2.5%

**SPECIFIC TESTS**

- **MELTING RANGE OR TEMPERATURE** (741): Approximately 196°
- **OPTICAL ROTATION, Specific Rotation** (781S): +98° to +104° at 20°  
**Sample solution:** 10 mg/mL in dioxane
- **LOSS ON DRYING** (731): Dry a sample at 105° for 3 h: it loses NMT 2.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
USP Clobetasol Propionate RS  
USP Clobetasol Propionate Related Compound A RS  
9 $\alpha$ -Fluoro-11 $\beta$ -hydroxy-16 $\beta$ -methyl 3-oxo-androsta-1,4-diene-17(R)-spiro-2'-[4'-chloro-5'-ethylfuran-3'(2'H)-one].  
 $C_{25}H_{30}ClFO_4$  448.96

**Clobetasol Propionate Cream****DEFINITION**

Clobetasol Propionate Cream is Clobetasol Propionate in a suitable cream base. It contains NLT 90.0% and NMT 115.0% of the labeled amount of clobetasol propionate ( $C_{25}H_{32}ClFO_5$ ).

**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

**Standard solution:** 0.6 mg/mL of USP Clobetasol Propionate RS in chloroform

**Test solution:** Transfer a portion of Cream equivalent to 0.75 mg of clobetasol propionate to a 25-mL, plastic-

stoppered centrifuge tube. Add 10 mL of methanol, and cap. Heat in a 60° water bath for 4 min, remove the tube from the bath, and shake vigorously. Repeat the heating and shaking. Cool to room temperature, add 3.5 mL of water, and mix. Centrifuge at 3500 rpm for 10 min. Transfer 5 mL of the supernatant to a 100-mL separator, add 1 g of sodium chloride and 10 mL of water, and mix. Extract with 5 mL of chloroform by shaking for 1 min, collect the lower layer, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 0.5 mL of chloroform.

**Developing solvent system:** Chloroform, acetone, and alcohol (100:10:5)

**Acceptance criteria:** The  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that from the *Standard solution*.

**ASSAY****• PROCEDURE**

**Buffer:** 0.05 M monobasic sodium phosphate. Adjust with 50% sodium hydroxide solution to a pH of 5.5.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (95:20:85)

**Internal standard solution:** 0.2 mg/mL of beclomethasone dipropionate in methanol

**System suitability solution:** 0.001 mg/mL of USP Clobetasol Propionate Related Compound A RS and 0.1 mg/mL of USP Clobetasol Propionate RS in *Mobile phase*

**Standard solution:** 0.04 mg/mL of USP Clobetasol Propionate RS and 0.08 mg/mL of beclomethasone dipropionate prepared as follows. Transfer 1.0 mg of USP Clobetasol Propionate RS to a 25-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, and dilute with methanol to volume.

**Sample solution:** Nominally 0.04 mg/mL of clobetasol propionate. In a suitable flask, dissolve a portion of Cream equivalent to 1.0 mg of clobetasol propionate in 10.0 mL of the *Internal standard solution* and 15.0 mL of methanol, and shake vigorously to disperse the Cream. Centrifuge at about 3500 rpm for 10 min, and pass a portion of the supernatant through a filter of 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for clobetasol propionate and clobetasol propionate related compound A are 1.0 and 1.1, respectively.]

**Suitability requirements**

**Resolution:** NLT 1.5 between clobetasol propionate and clobetasol propionate related compound A

**Column efficiency:** NLT 5000 theoretical plates for the clobetasol propionate peak

**Tailing factor:** NMT 2.0 for the clobetasol propionate peak

**Relative standard deviation:** NMT 2.0% for the clobetasol propionate peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for clobetasol propionate and beclomethasone dipropionate are 1.0 and 1.6, respectively.]

Calculate the percentage of clobetasol propionate ( $C_{25}H_{32}ClFO_5$ ) in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Sample solution*
- $R_S$  = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Standard solution*
- $C_S$  = concentration of USP Clobetasol Propionate RS in the *Standard solution* (mg/mL)
- $C_U$  = nominal concentration of clobetasol propionate in the *Sample solution* (mg/mL)
- Acceptance criteria:** 90.0%–115.0%

**PERFORMANCE TESTS**

- **MINIMUM FILL** <755>: Meets the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed  $10^2$  cfu/g. It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.
- **PH** <791>: 4.5–7.0

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers. Store at controlled room temperature. Do not refrigerate.
- **USP REFERENCE STANDARDS** <11>
  - USP Clobetasol Propionate RS
  - USP Clobetasol Propionate Related Compound A RS
  - 9 $\alpha$ -Fluoro-11 $\beta$ -hydroxy-16 $\beta$ -methyl 3-oxo-androsta-1,4-diene-17(R)-spiro-2'-[4'-chloro-5'-ethylfuran-3'(2'H)-one].
  - $C_{25}H_{30}ClFO_4$  448.96

## Clobetasol Propionate Ointment

**DEFINITION**

Clobetasol Propionate Ointment is Clobetasol Propionate in a suitable ointment base. It contains NLT 90.0% and NMT 115.0% of the labeled amount of clobetasol propionate ( $C_{25}H_{32}ClFO_5$ ).

**IDENTIFICATION**

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>
  - Standard solution:** 0.5 mg/mL of USP Clobetasol Propionate RS in chloroform
  - Test solution:** Nominally 0.5 mg/mL of clobetasol propionate. Transfer a portion of Ointment equivalent to 1.0 mg of clobetasol propionate to a 25-mL, plastic-stoppered centrifuge tube. Add 10 mL of methanol, and cap. Heat in a 70° water bath for 4 min, remove the tube from the bath, and shake vigorously. Repeat the heating and shaking. Freeze the mixture in an ice bath for 5 min, and centrifuge at about 3500 rpm for 10 min. Transfer 5 mL of the supernatant to a suitable vial. Evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 1.0 mL of chloroform.
  - Developing solvent system:** Chloroform, acetone, and alcohol (100:10:5)
  - Acceptance criteria:** The  $R_F$  value of the principal spot obtained from the *Test solution* corresponds to that from the *Standard solution*.

**ASSAY**

- **PROCEDURE**
  - Buffer:** 0.05 M monobasic sodium phosphate. Adjust with 85% phosphoric acid to a pH of 2.5.
  - Mobile phase:** Acetonitrile, methanol, and *Buffer* (95:20:85)

**Internal standard solution:** 0.2 mg/mL of beclomethasone dipropionate in methanol

**System suitability solution:** 0.001 mg/mL of USP Clobetasol Propionate Related Compound A RS and 0.1 mg/mL of USP Clobetasol Propionate RS in *Mobile phase*

**Standard solution:** Dissolve a quantity of USP Clobetasol Propionate RS in methanol and *Internal standard solution* to obtain a final solution of 0.04 mg/mL of USP Clobetasol Propionate RS and 0.08 mg/mL of beclomethasone dipropionate

**Sample solution:** Nominally 0.04 mg/mL of clobetasol propionate. Transfer a portion of Ointment equivalent to 1.0 mg of clobetasol propionate into a 125-mL separatory funnel. Add 30 mL of hexane, 10.0 mL of the *Internal standard solution*, and shake. Collect the lower layer in a 25-mL volumetric flask. Extract the hexane remaining in the separatory funnel with two 5-mL portions of *Mobile phase*, and combine all of the extracts in the 25-mL volumetric flask. Dilute with *Mobile phase* to volume, and pass a portion through a filter of 0.45- $\mu$ m pore size.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection size:** 10  $\mu$ L

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for clobetasol propionate and clobetasol propionate related compound A are 1.0 and 1.1, respectively.]

**Suitability requirements**

**Relative standard deviation:** NMT 2.0% for the clobetasol propionate peak

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

[NOTE—The relative retention times for clobetasol propionate and beclomethasone dipropionate are 1.0 and 1.6, respectively.]

Calculate the percentage of clobetasol propionate ( $C_{25}H_{32}ClFO_5$ ) in the portion of Ointment taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Sample solution*

$R_S$  = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Standard solution*

$C_S$  = concentration of USP Clobetasol Propionate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clobetasol propionate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–115.0%

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed  $10^2$  cfu/g. It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.

- **MINIMUM FILL** <755>: Meets the requirements

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or in tight containers. Store at controlled room temperature. Do not refrigerate.
- **USP REFERENCE STANDARDS** <11>
  - USP Clobetasol Propionate RS
  - USP Clobetasol Propionate Related Compound A RS
  - 9 $\alpha$ -Fluoro-11 $\beta$ -hydroxy-16 $\beta$ -methyl 3-oxo-androsta-1,4-diene-17(R)-spiro-2'-[4'-chloro-5'-ethylfuran-3'(2'H)-one].
  - C<sub>25</sub>H<sub>30</sub>ClFO<sub>4</sub> 448.96

### Clobetasol Propionate Topical Solution

#### DEFINITION

Clobetasol Propionate Topical Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of clobetasol propionate (C<sub>25</sub>H<sub>32</sub>ClFO<sub>5</sub>).

#### IDENTIFICATION

- **A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** <201>
  - Standard solution:** 0.75 mg/mL of USP Clobetasol Propionate RS in chloroform
  - Test solution:** Nominally 0.75 mg/mL of clobetasol propionate. Transfer a portion of Topical Solution equivalent to 1.5 mg of clobetasol to a 50-mL separatory funnel. Add 5 mL of water, and extract with 5 mL of chloroform. Collect the lower layer through a cotton wool plug, and evaporate with the aid of a stream of nitrogen to dryness. Dissolve the residue in 2 mL of chloroform.
  - Developing solvent system:** Chloroform, acetone, and alcohol (100:10:5)
  - Acceptance criteria:** The *R<sub>f</sub>* value of the principal spot obtained from the *Test solution* corresponds to that from the *Standard solution*.

#### ASSAY

- **PROCEDURE**
  - Buffer:** 0.05 M monobasic sodium phosphate. Adjust with 85% phosphoric acid to a pH of 2.5.
  - Mobile phase:** Acetonitrile, methanol, and Buffer (95:20:85)
  - Internal standard solution:** 0.2 mg/mL of beclomethasone dipropionate in methanol
  - System suitability solution:** 0.001 mg/mL of USP Clobetasol Propionate Related Compound A RS and 0.1 mg/mL of USP Clobetasol Propionate RS in *Mobile phase*
  - Standard solution:** 0.04 mg/mL of USP Clobetasol Propionate RS and 0.08 mg/mL of beclomethasone dipropionate prepared as follows. Transfer 1.0 mg of USP Clobetasol Propionate RS to a 25-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, and dilute with methanol to volume.
  - Sample solution:** Nominally 0.04 mg/mL of clobetasol propionate. Transfer a portion of Topical Solution equivalent to 1.0 mg of clobetasol propionate to a 25-mL volumetric flask, add 10.0 mL of the *Internal standard solution*, and dilute with *Mobile phase* to volume.
- Chromatographic system**
  - (See *Chromatography* <621>, *System Suitability*.)
  - Mode:** LC
  - Detector:** UV 240 nm
  - Column:** 4.6-mm  $\times$  15-cm; packing L1
  - Flow rate:** 1 mL/min
  - Injection size:** 10  $\mu$ L

#### System suitability

**Sample:** *System suitability solution*  
 [NOTE—The relative retention times for clobetasol propionate and clobetasol propionate related compound A are 1.0 and 1.1, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.5 between clobetasol propionate and clobetasol propionate related compound A  
**Column efficiency:** NLT 5000 theoretical plates for the clobetasol propionate peak  
**Tailing factor:** NMT 2.0 for the clobetasol propionate peak  
**Relative standard deviation:** NMT 2.0% for the clobetasol propionate peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
 [NOTE—The relative retention times for clobetasol propionate and beclomethasone dipropionate are 1.0 and 1.6, respectively.]  
 Calculate the percentage of clobetasol propionate (C<sub>25</sub>H<sub>32</sub>ClFO<sub>5</sub>) in the portion of Topical Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- R<sub>U</sub>* = ratio of the clobetasol propionate peak area to the internal standard peak area from the *Sample solution*  
*R<sub>S</sub>* = ratio of the clobetasol propionate peak area to the Internal standard peak area from the *Standard solution*  
*C<sub>S</sub>* = concentration of USP Clobetasol Propionate RS in the *Standard solution* (mg/mL)  
*C<sub>U</sub>* = nominal concentration of clobetasol propionate in the *Sample solution* (mg/mL)  
**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

- **MINIMUM FILL** <755>: Meets the requirements

#### SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: The total aerobic microbial count does not exceed 10<sup>2</sup> cfu/g. It meets the requirements of the tests for absence of *Staphylococcus aureus*, *Pseudomonas aeruginosa*, *Escherichia coli*, and *Salmonella* species.
- **pH** <791>: 4.5–6.0

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature. Do not refrigerate.
- **USP REFERENCE STANDARDS** <11>
  - USP Clobetasol Propionate RS
  - USP Clobetasol Propionate Related Compound A RS
  - 9 $\alpha$ -Fluoro-11 $\beta$ -hydroxy-16 $\beta$ -methyl 3-oxo-androsta-1,4-diene-17(R)-spiro-2'-[4'-chloro-5'-ethylfuran-3'(2'H)-one].
  - C<sub>25</sub>H<sub>30</sub>ClFO<sub>4</sub> 448.96

### Clocortolone Pivalate

C<sub>27</sub>H<sub>36</sub>ClFO<sub>5</sub> 495.02  
 Pregna-1,4-diene-3,20-dione, 9-chloro-21-(2,2-dimethyl-1-oxopropoxy)-6-fluoro-11-hydroxy-16-methyl-, (6 $\alpha$ ,11 $\beta$ ,16 $\alpha$ )-.

9-Chloro-6 $\alpha$ -fluoro-11 $\beta$ ,21-dihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione 21-pivalate [34097-16-0].

» Clotocortolone Pivalate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{27}H_{36}ClFO_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Clotocortolone Pivalate RS

**Color and clarity of solution**—A 1 in 100 solution in chloroform is clear and practically colorless.

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 15  $\mu$ g per mL.

*Medium:* methanol.

Absorptivities at 238 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** (781S): between +125° and +135°.

*Test solution:* 40 mg per mL, in chloroform.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%, a 100-mg test specimen being used.

**Chromatographic purity**—

*Test solution*—Accurately weigh about 100 mg of Clotocortolone Pivalate, and transfer to a 25-mL volumetric flask. Dissolve in a mixture of chloroform and methanol (1:1), and dilute with the same solvent to volume.

*Standard solution*—Using an accurately weighed quantity of USP Clotocortolone Pivalate RS, prepare a solution in a mixture of chloroform and methanol (1:1) having a known concentration of about 4 mg per mL.

*Procedure*—Score a 20- × 20-cm thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture into three equal sections to be used for the *Test solution*, the blank, and the *Standard solution*, respectively. Activate the plate at 105° for 30 minutes before use. Apply 100  $\mu$ L each of the *Test solution* and the *Standard solution* as streaks 2.5 cm from the bottom of the appropriate section of the plate, and dry the streaks with a gentle current of air. Using a solvent system consisting of a mixture of cyclohexane and ethyl acetate (2:1), develop the chromatogram in a suitable chromatographic chamber lined with absorbent paper and previously equilibrated, until the solvent front has moved 15 cm above the line of application. Air-dry the plate, and develop the chromatogram a second time using the same chromatographic system. Air-dry the plate, and locate the principal band occupied by the *Standard solution* by viewing under UV light. Mark this band as well as corresponding bands in the blank and *Test solution* sections of the plate. Quantitatively remove the silica gel from each band, and transfer to separate glass-stoppered, 50-mL centrifuge tubes. Add 25.0 mL of methanol to each tube, shake for not less than 20 minutes, and centrifuge. Concomitantly determine the absorbances of the supernatants from the *Test solution* and the *Standard solution* against the blank at the wavelength of maximum absorbance at about 238 nm, with a suitable spectrophotometer. Calculate the percentage of chromatographic impurities in the *Test solution* taken by the formula:

$$100 - [100(C_s / C_u)(A_u / A_s)]$$

in which  $C_s$  is the concentration, in mg per mL, of USP Clotocortolone Pivalate RS in the *Standard solution*;  $C_u$  is the concentration, in mg per mL, of the *Test solution*; and  $A_u$  and  $A_s$  are the absorbances of the solutions from the *Test*

*solution* and the *Standard solution*, respectively: not more than 3.0% of total impurities is found.

**Assay**—

*Standard preparation*—Dissolve an accurately weighed quantity of USP Clotocortolone Pivalate RS in chloroform to obtain a solution having a known concentration of about 0.75 mg per mL. Dilute an accurately measured volume of this solution with methanol, and mix to obtain a *Standard preparation* having a known concentration of about 30  $\mu$ g per mL.

*Assay preparation*—Accurately weigh about 75 mg of Clotocortolone Pivalate, and transfer to a 100-mL volumetric flask. Dissolve in chloroform, dilute with chloroform to volume, and mix. Transfer 4.0 mL of this solution to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

*Procedure*—Transfer 10.0-mL portions of the *Standard preparation* and the *Assay preparation* to separate glass-stoppered, 50-mL conical flasks, and evaporate on a steam bath to dryness. To each flask, and to a third flask to provide the blank, add 15.0 mL of a solution containing 250 mg of isoniazid and 0.3 mL of hydrochloric acid in 500 mL of methanol. Swirl the contents of the flasks to dissolve the residues. Insert the stoppers securely in the flasks, and place in a water bath at 60° for 2.5 hours. Cool to room temperature. Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells against the blank at the wavelength of maximum absorbance at about 405 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of  $C_{27}H_{36}ClFO_5$  in the portion of Clotocortolone Pivalate taken by the formula:

$$2.5C(A_u / A_s)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Clotocortolone Pivalate RS in the *Standard preparation*, and  $A_u$  and  $A_s$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Clotocortolone Pivalate Cream

» Clotocortolone Pivalate Cream contains not less than 90.0 percent and not more than 110.0 percent of  $C_{27}H_{36}ClFO_5$  in a suitable cream base. It may contain suitable preservatives.

**Packaging and storage**—Preserve in collapsible tubes or in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Clotocortolone Pivalate RS

**Identification**—Place a portion of Cream, equivalent to about 1 mg of clotocortolone pivalate, in a suitable separator. Add 5 mL of water, and extract with 10 mL of chloroform. Evaporate the chloroform layer to dryness, and dissolve the residue in 2 mL of methanol. Apply 20  $\mu$ L of this test solution and 20  $\mu$ L of a *Standard solution* of USP Clotocortolone Pivalate RS in chloroform containing about 0.5 mg per mL about 1.5 cm from the bottom of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of cyclohexane and ethyl acetate (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

**Minimum fill** (755): meets the requirements.

**pH** (791): between 5.0 and 7.0, in a 1 in 10 aqueous dispersion.

**Particle size determination**—Place a small portion of Cream on a microscope slide, apply a cover slide, press slightly, and examine under 40× objective magnification using a suitable microscope equipped with polarized light. Scan the complete slide preparation, and record the size of the largest crystal found in reference to a calibrated grid: no particle in the Cream is greater than 50 microns when measured in the longitudinal axis.

**Assay**—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Clocortolone Pivalate RS in methanol to obtain a solution having a known concentration of about 0.06 mg per mL.

**Assay preparation**—Using a plastic syringe equipped with a suitable cannula, transfer an accurately weighed quantity of Cream, equivalent to about 3 mg of clocortolone pivalate, to a 50-mL volumetric flask. Add about 25 mL of methanol, and warm the flask in a 60° water bath for about 10 minutes, with occasional swirling, to disperse the Cream. Cool to room temperature, dilute with methanol to volume, and mix. Allow any insoluble material to settle.

**Procedure**—Transfer 10.0 mL of the *Standard preparation* to a 25-mL volumetric flask. Transfer 10.0-mL portions of the *Assay preparation* into two separate 25-mL volumetric flasks labeled *Assay preparation* and *Assay blank*, respectively. Evaporate the contents of the three flasks with the aid of a stream of air or nitrogen to dryness. Transfer 20.0 mL of a solution containing 250 mg of isoniazid and 0.3 mL of hydrochloric acid in 500 mL of methanol to the flasks containing the *Standard preparation*, the *Assay preparation*, and a fourth 25-mL volumetric flask labeled *Reagent blank*. Pipet 20 mL of acidified methanol solution (0.3 mL of hydrochloric acid diluted with methanol to 500 mL) into the flask labeled *Assay blank*. Insert the stoppers securely in the flasks, and place in a water bath at 60° for 2.5 hours, occasionally swirling the contents of each flask. Cool the flasks to room temperature, dilute with the acidified methanol solution to volume, and mix. Centrifuge the *Assay preparation* at high speed for 10 minutes. Concomitantly determine the absorbances of the *Standard preparation*, the *Assay preparation*, the *Assay blank*, and the *Reagent blank* against acidified methanol solution as the solvent blank in 1-cm cells at the wavelength of maximum absorbance at about 390 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of  $C_{27}H_{36}ClFO_5$  in the portion of Cream taken by formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Clocortolone Pivalate RS in the *Standard preparation*;  $A_U$  is the absorbance of the *Assay preparation*, corrected for the *Assay blank* and the *Reagent blank*; and  $A_S$  is the absorbance of the *Standard preparation* corrected for the *Reagent blank*.

## Clofazimine

$C_{27}H_{22}Cl_2N_4$  473.40  
2-Phenazinamine, *N*,5-bis(4-chlorophenyl)-3,5-dihydro-3-[(1-methylethyl)imino]-

3-(*p*-Chloroanilino)-10-(*p*-chlorophenyl)-2,10-dihydro-2-(isopropylimino)phenazine [2030-63-9].

» Clofazimine contains not less than 98.5 percent and not more than 101.5 percent of  $C_{27}H_{22}Cl_2N_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, at room temperature.

**USP Reference standards** (11)—

USP Clofazimine RS

**Identification**—

**A: Infrared Absorption** (197S): 5% solution in methylene chloride.

**B:** The  $R_f$  value of the principal spot observed in the chromatogram of the *Test preparation* corresponds to that of *Standard preparation A* as obtained in the test for *Chromatographic purity*.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281)—not more than 0.1%.

**Chromatographic purity**—

**Standard preparations**—Dissolve an accurately weighed quantity of USP Clofazimine RS in methylene chloride, and mix to obtain *Standard preparation A* having a known concentration of about 0.5 mg per mL. Dilute portions of *Standard preparation A* quantitatively with methylene chloride to obtain *Standard preparations B* and *C* having known concentrations of 0.25 and 0.1 mg per mL, respectively.

**Test preparation**—Dissolve an accurately weighed quantity of Clofazimine in methylene chloride to obtain a solution having a known concentration of about 50 mg per mL.

**Ammonia solution**—Pipet 1 mL of ammonium hydroxide into a 100-mL volumetric flask, dilute with water to volume, and mix. [NOTE—Prepare this solution fresh daily.]

**Chromatographic plate**—Use a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Immediately before use, expose the plate to ammonia vapors for 30 minutes by suspending the plate in a tank containing a shallow layer of approximately 25 mL of *Ammonia solution*. [NOTE—Prevent the plate from coming into contact with the liquid.]

**Procedure**—Separately apply 5  $\mu$ L of the *Test preparation* and 5  $\mu$ L of each *Standard preparation* to the *Chromatographic plate*. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methylene chloride and *n*-propyl alcohol (10:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and air-dry. Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots observed in the chromatogram of the *Test preparation* with those of the principal spots in the chromatograms of the *Standard preparations*: no secondary spot from the chromatogram of the *Test preparation* is larger or more intense than the principal spot obtained from *Standard preparation A* (1.0%), and the sum of the intensities of the secondary spots obtained from the *Test preparation* corresponds to not more than 2.0%.

**Assay**—Dissolve about 300 mg of Clofazimine, accurately weighed, in 5 mL of chloroform, with the aid of heat if necessary. Add 20 mL of acetone and 5 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS in glacial acetic acid, determining the endpoint potentiometrically, using a glass electrode and a calomel electrode with a saturated solution of potassium chloride as the bridge fluid and agar gel as the bridge. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 47.34 mg of  $C_{27}H_{22}Cl_2N_4$ .

## Clofazimine Capsules

» Clofazimine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{27}H_{22}Cl_2N_4$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Clofazimine RS

**Identification**—

**A:** The  $R_f$  value of the principal spot observed in the chromatogram of the *Test preparation* corresponds to that of the *Standard preparation* in the test for *Chromatographic purity*.

**B:** The UV absorption spectrum of the *Assay preparation*, prepared as directed in the *Assay*, exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Clofazimine RS, concomitantly measured.

**Dissolution** (711)—

*Medium:* water; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 15 minutes.

**Procedure**—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each capsule shell to rupture.

**Tolerances**—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than 30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Chromatographic purity**—

*Ammonia solution, Chromatographic plate, and Procedure*—Proceed as directed in the test for *Chromatographic purity* under *Clofazimine*.

**Standard preparations**—Dissolve an accurately weighed quantity of USP Clofazimine RS in methylene chloride, and mix to obtain *Standard preparation A* having a known concentration of about 0.5 mg per mL. Dilute portions of *Standard preparation A* quantitatively with methylene chloride to obtain *Standard preparations B* and *C* having known concentrations of 0.1 and 0.04 mg per mL, respectively.

**Test preparation**—To a portion of Capsule contents, equivalent to about 500 mg of clofazimine, add 25 mL of methylene chloride and 25 mL of 0.1 N sodium hydroxide, and sonicate for 30 minutes. Withdraw the methylene chloride layer, and filter through anhydrous sodium sulfate.

**Assay**—

**0.1 N Methanolic hydrochloric acid**—Pipet 10 mL of hydrochloric acid into a 1000-mL volumetric flask containing about 500 mL of methanol, mix, and dilute with methanol to volume.

**Reference solution**—Pipet 5 mL of methylene chloride into a 50-mL volumetric flask, dilute with 0.1 N *Methanolic hydrochloric acid* to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Clofazimine RS in methylene chloride, and dilute quantitatively, and stepwise if necessary, with methylene chloride to obtain a solution having a known concentration of about 0.075 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.1 N *Methanolic hydrochloric acid* to volume, and mix.

**Assay preparation**—Remove, as completely as possible, the contents of not less than 20 Capsules with the aid of

methylene chloride. Dissolve in methylene chloride, filter the solution through a pledget of cotton, and dilute quantitatively, and stepwise if necessary, with methylene chloride to obtain a solution having a concentration of about 0.075 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with 0.1 N *Methanolic hydrochloric acid* to volume, and mix.

**Procedure**—Concomitantly determine the UV absorbances of the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 491 nm, using the *Reference solution* as the blank. Calculate the quantity, in mg, of  $C_{27}H_{22}Cl_2N_4$  in the Capsules taken by the formula:

$$(L / D)C(A_U / A_S)$$

in which *L* is the labeled quantity, in mg, of clofazimine in each Capsule; *D* is the concentration, in mg per mL, of clofazimine in the *Assay preparation*, based on the labeled quantity and extent of dilution; *C* is the concentration, in mg per mL, of USP Clofazimine RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Clofibrate

$C_{12}H_{15}ClO_3$  242.70

Propanoic acid, 2-(4-chlorophenoxy)-2-methyl-, ethyl ester.  
Ethyl 2-(*p*-chlorophenoxy)-2-methylpropanoate [637-07-0].

» Clofibrate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{12}H_{15}ClO_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Clofibrate RS

**Identification**—

**A:** *Infrared Absorption* (197F).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 20 µg per mL.

*Medium:* methanol.

**Refractive index** (831): between 1.500 and 1.505, at 20°.

**Acidity**—Mix 10.0 g with 100 mL of neutralized alcohol, add 3 drops of phenolphthalein TS, and titrate with 0.10 N sodium hydroxide: not more than 0.90 mL is required for neutralization.

**Water, Method I** (921): not more than 0.2%.

**Chromatographic purity**—

**Standard preparation**—Prepare a solution in chloroform having known concentrations of about 0.1 mg of USP Clofibrate RS and 0.03 mg of *p*-chlorophenol per mL. To 10.0 mL of this solution add 5.0 µL of tributyrin, and mix.

**Test preparation**—To 10.0 mL of Clofibrate add 5.0 µL of tributyrin, and mix.

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a split injector with a 20:1 split ratio, a flame-ionization detector, and a 0.53-mm × 15-m column to the internal walls of which is bonded a 1.5-µm film of phase G1. The chromatograph is programmed to maintain the column temperature at 120° for

1 minute, then to increase the temperature at a rate of 5° per minute for 12 minutes, and finally to maintain a temperature of 180° for 9 minutes. Maintain the injection port at 210° and the detector block at 220°. Helium is used as the carrier gas flowing at a rate of about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.2 for *p*-chlorophenol, 0.55 for clofibrate, and 1.0 for tributyrin.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 1 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity, other than *p*-chlorophenol, in the Clofibrate taken by the formula:

$$0.1C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Clofibrate RS in the *Standard preparation*,  $R_U$  is the ratio of the response of each individual impurity peak (other than the *p*-chlorophenol peak) to that of the tributyrin peak obtained from the *Test preparation*, and  $R_S$  is the ratio of the response of the clofibrate peak to that of the tributyrin peak obtained from the *Standard preparation*: the percentage of any impurity, other than *p*-chlorophenol, does not exceed 0.01%, and the total percentage of all such impurities does not exceed 0.12%.

**Limit of *p*-chlorophenol**—Use the chromatograms obtained in the test for *Chromatographic purity*. Calculate the percentage of *p*-chlorophenol in the portion of Clofibrate taken by the formula:

$$0.1C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of *p*-chlorophenol in the *Standard preparation*, and  $R_U$  and  $R_S$  are the ratios of the responses of the *p*-chlorophenol and tributyrin peaks obtained from the *Test preparation* and the *Standard preparation*, respectively: not more than 0.003% of *p*-chlorophenol is found.

#### Assay—

**Ion-exchange resin**—To a beaker containing 75 mL of 1 N sodium hydroxide add about 3 g of a 50- to 100-mesh strongly basic styrene-divinylbenzene anion-exchange resin, and allow the mixture to stand for about 15 minutes, with occasional stirring. Wash the resin with water until the last washing is neutral to litmus paper, then wash with three 50-mL portions of methanol.

**Ion-exchange column**—Place a plug of glass wool in the base of a 1- × 15-cm ion-exchange tube, and transfer to the tube a sufficient amount of *ion-exchange resin*, slurried in methanol, to produce a column bed height of from 6 cm to 8 cm.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Clofibrate RS in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution having a known concentration of about 20 µg per mL.

**Assay preparation**—Transfer about 200 mg of Clofibrate, accurately weighed, to a 100-mL volumetric flask, add methanol to volume, and mix. Transfer 10.0 mL of this solution to the *ion-exchange column*, and collect the eluate in a 100-mL volumetric flask. Rinse the column with 25 mL of methanol, collect the rinsing in the volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 226 nm, with a suitable spectrophotometer, using methanol

as the blank. Calculate the quantity, in mg, of  $C_{12}H_{15}ClO_3$  in the portion of Clofibrate taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Clofibrate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Clofibrate Capsules

» Clofibrate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{12}H_{15}ClO_3$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

#### USP Reference standards (11)—

USP Clofibrate RS

**Identification**—Capsules respond to *Identification test A* under *Clofibrate*.

#### Dissolution (711)—

**Medium:** sodium lauryl sulfate solution (5 in 100); 1000 mL.

**Apparatus 2:** 100 rpm.

**Time:** 180 minutes.

Determine the amount of  $C_{12}H_{15}ClO_3$  dissolved by employing the following method.

**Mobile phase**—Prepare a degassed and filtered mixture of methanol and water (80:20).

**Standard solution**—Transfer about 20 mg of USP Clofibrate RS, accurately weighed, to a 50-mL volumetric flask. Add 20 mL of methanol, mix to dissolve the clofibrate, dilute with water to volume, and mix. Dilute an aliquot quantitatively with methanol to obtain a final solution having a known concentration of about 80 µg per mL.

**Test solution**—Dilute a 5.0-mL portion of the solution under test to 25.0 mL, using methanol. Allow to stand for 5 minutes, and filter.

**Chromatographic system**—The liquid chromatograph is equipped with a 226-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal portions (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of  $C_{12}H_{15}ClO_3$  dissolved.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{12}H_{15}ClO_3$  is dissolved in 180 minutes.

**Uniformity of dosage units (905):** meet the requirements.

**Assay**—Proceed with Capsules as directed in the *Assay under Clofibrate*, using the following as the *Assay preparation*: Weigh accurately not less than 20 Capsules in a tared weighing bottle. With a sharp blade, carefully open the Capsules, without loss of shell material, and transfer the contents to a 100-mL beaker. Remove any liquid from the emptied capsules by washing with several small portions of ether. Discard the washings, and allow the capsules to dry in a jet of dry air until the odor of ether no longer is perceptible. Weigh the empty capsules in the tared weighing bottle, and calculate the average net weight per capsule. Transfer an accurately weighed amount of capsule contents,

equivalent to about 200 mg of clofibrate, to a 100-mL volumetric flask, add methanol to volume, and mix. Transfer 10.0 mL of this solution to the *Ion-exchange column*, and collect the eluate in a 100-mL volumetric flask. Rinse the column with 25 mL of methanol, collect the rinsings in the volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Calculate the quantity, in mg, of  $C_{12}H_{15}ClO_3$  in the portion of Capsules taken by the formula:

$$10C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Clomiphene RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Clomiphene Citrate

$C_{26}H_{28}ClNO \cdot C_6H_8O_7$  598.08

Ethanamine, 2-[4-(2-chloro-1,2-diphenylethenyl)phenoxy]-N,N-diethyl-, 2-hydroxy-1,2,3-propanetricarboxylate (1:1). 2-[p-(2-Chloro-1,2-diphenylvinyl)phenoxy]triethylamine citrate (1:1) [50-41-9].

» Clomiphene Citrate contains not less than 98.0 percent and not more than 102.0 percent of a mixture of the (E)- and (Z)-geometric isomers of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ , calculated on the anhydrous basis. It contains not less than 30.0 percent and not more than 50.0 percent of the Z-isomer, [(Z)-2-[4-(2-chloro-1,2-diphenylethenyl)phenoxy]-N,N-diethylethanamine 2-hydroxy-1,2,3-propanetricarboxylate (1:1).

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Clomiphene Citrate RS

USP Clomiphene Related Compound A RS

(E,Z)-2-[4-(1,2-Diphenylethenyl)phenoxy]-N,N-diethylethanamine hydrochloride.

$C_{26}H_{29}NO \cdot HCl$  407.98

### Identification—

**A:** It meets the requirements under *Identification—Organic Nitrogenous Bases* (181).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 20  $\mu\text{g}$  per mL.

*Medium:* 0.1 N hydrochloric acid.

**C:** It responds to the tests for *Citrate* (191).

**Water, Method I** (921): not more than 1.0%.

**Heavy metals, Method II** (231): 0.002%.

### Content of (Z)-isomer—

*Mobile phase, Standard preparation, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.

*Test solution*—Use the Assay preparation prepared as directed in the Assay.

*Procedure*—Inject a volume (about 50  $\mu\text{L}$ ) of the *Test solution* into the chromatograph, record the chromatograms,

and measure the responses for the major peaks. Calculate the percentage of (Z)-isomer in the portion of Clomiphene Citrate taken by the formula:

$$100(r_Z / r_i)$$

in which  $r_Z$  is the peak response of the (Z)-isomer in the *Test solution*, and  $r_i$  is the sum of all of the peak responses obtained from the *Test solution*.

### Related compounds—

*Mobile phase and System suitability solution*—Proceed as directed in the Assay.

*Standard solution*—Dissolve an accurately weighed quantity of USP Clomiphene Citrate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 1.0  $\mu\text{g}$  per mL.

*Test solution*—Use the Assay preparation.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 290-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L26. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for clomiphene related compound A, 1.0 for the (Z)-isomer, and 1.2 for the (E)-isomer; the resolution,  $R$ , between clomiphene related compound A and the (Z)-isomer is not less than 1.0; and the resolution,  $R$ , between the (Z)-isomer and the (E)-isomer is not less than 1.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates for the (E)-isomer; the tailing factor is not more than 3.0 for the (E)-isomer; and the relative standard deviation for replicate injections is not more than 2.0% determined from both the (E)- and (Z)-isomers.

*Procedure*—Inject a volume (about 50  $\mu\text{L}$ ) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Clomiphene Citrate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all of the peaks: not more than 2.0% of clomiphene related compound A is found; not more than 0.5% of any other individual impurity is found; and not more than 2.0% of total impurities is found.

### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol, water, and triethylamine (55:45:0.3). Adjust with phosphoric acid to a pH of 2.5. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*System suitability solution*—Dissolve suitable quantities of USP Clomiphene Related Compound A RS and USP Clomiphene Citrate RS in *Mobile phase* to obtain a solution containing about 0.002 and 0.05 mg per mL, respectively.

*Standard preparation*—[NOTE—Use actinic glassware for all solutions.] Dissolve an accurately weighed quantity of USP Clomiphene Citrate RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.05 mg per mL.

*Assay preparation*—Transfer about 50 mg of the Clomiphene Citrate, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 233-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L26. The flow rate is about 1 mL per minute. Chromatograph the

*System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for clomiphene related compound A, 1.0 for (Z)-isomer, and 1.2 for (E)-isomer; and the resolution, *R*, between clomiphene related compound A and (Z)-isomer is not less than 1.0 and between (Z)-isomer and (E)-isomer is not less than 1.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates for the (E)-isomer; the tailing factor is not more than 3.0 for the (E)-isomer; and the relative standard deviation for replicate injections is not more than 2.0% for both (E)- and (Z)-isomers.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$  in the portion of Clomiphene Citrate taken by the formula:

$$1000C(r_{UE} + r_{UZ} / r_{SE} + r_{SZ})$$

in which *C* is the concentration, in mg per mL, of USP Clomiphene Citrate RS in the *Standard preparation*; *r<sub>UE</sub>* and *r<sub>UZ</sub>* are the peak responses obtained from the *Assay preparation* for the (E)- and (Z)-isomers, respectively; and *r<sub>SE</sub>* and *r<sub>SZ</sub>* are the peak responses obtained from the *Standard preparation* for the (E)- and (Z)-isomers, respectively.

## Clomiphene Citrate Tablets

» Clomiphene Citrate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$ .

**Packaging and storage**—Preserve in well-closed containers, protected from light.

### USP Reference standards (11)—

USP Clomiphene Citrate RS

USP Clomiphene Related Compound A RS

(E,Z)-2-[4-(1,2-Diphenylethenyl)phenoxy]-N,N-diethylethanamine hydrochloride.

$C_{26}H_{29}NO \cdot HCl$  407.98

**Identification**—Place a portion of finely powdered Tablets, equivalent to about 30 mg of clomiphene citrate, in a centrifuge tube containing about 30 mL of a 1 in 2 solution of methanol in 0.1 N hydrochloric acid. Insert the stopper, and place the tube in a water bath at about 37° for 15 minutes. Shake occasionally. Centrifuge, and place the clear supernatant in a separator. Extract with one 40-mL and two 25-mL portions of hexanes, and discard the extract. Render the aqueous solution alkaline with 1 N sodium hydroxide, and extract the precipitated base with one 50-mL and two 25-mL portions of hexanes. Wash the combined extracts with two portions of water. Dry the extract with anhydrous sodium sulfate, and remove the hexanes by evaporation under reduced pressure. Add about 1.0 mL of carbon disulfide to the residue, and dissolve. Determine the absorption spectra of the test solution and of a Standard solution of USP Clomiphene Citrate RS, similarly prepared, as directed under *Identification*—*Organic Nitrogenous Bases* (181).

### Dissolution (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

*Procedure*—Determine the amount of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$  dissolved from UV absorbances at the wavelength

of maximum absorbance at about 232 nm of filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, in comparison with a Standard solution having a known concentration of USP Clomiphene Citrate RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*Mobile phase*, *Standard preparation*, *System suitability solution*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Clomiphene Citrate*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of clomiphene citrate, to a 100-mL volumetric flask. Add about 50 mL of *Mobile phase*, and stir using a magnetic bar for about 30 minutes. Remove the magnetic bar from the flask, dilute with *Mobile phase* to volume, mix, and filter. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, mix, and filter, discarding the first 10 mL. [NOTE—This solution is stable for at least 24 hours.]

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{26}H_{28}ClNO \cdot C_6H_8O_7$  in the portion of Tablets taken by the formula:

$$1000C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Clomiphene Citrate RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clomipramine Hydrochloride

$C_{19}H_{23}ClN_2 \cdot HCl$  351.31

5*H*-Dibenz[*b,f*]azepine-5-propanamine, 3-chloro-10,11-dihydro-*N,N*-dimethyl-, monohydrochloride.

3-Chloro-5-[3-(dimethylamino)propyl]-10,11-dihydro-5*H*-dibenz[*b,f*]azepine monohydrochloride [17321-77-6].

» Clomipramine Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{19}H_{23}ClN_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Clomipramine Hydrochloride RS

USP Desipramine Hydrochloride RS

USP Imipramine Hydrochloride RS

**Identification—****A: Infrared Absorption** (197K).**B: Ultraviolet Absorption** (197U)—*Solution:* 100 µg per mL.*Medium:* 0.1 N hydrochloric acid.

Absorptivities at the wavelength of maximum absorbance, calculated on the dried basis, do not differ by more than 1.0%.

**pH** (791): between 3.5 and 5.0, in a solution having a concentration of about 100 mg per mL.**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.**Residue on ignition** (281): not more than 0.1%.**Heavy metals, Method II** (231): 0.01%.**Chromatographic purity—****TEST 1—***Sodium 1-heptanesulfonate solution, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.*Mobile phase*—Transfer 20.0 mL of *Sodium 1-heptanesulfonate solution*, 2.0 mL of triethylamine, and 500 mL of water to a suitable container, mix, adjust with phosphoric acid to a pH of  $3.2 \pm 0.1$ , and dilute with water to 625 mL. Transfer to a 1-liter volumetric flask, dilute with acetonitrile to volume, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).*Test solution*—Transfer about 100 mg of Clomipramine Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.*Procedure*—Inject a volume (about 5 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Clomipramine Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks.**TEST 2—***Sodium 1-heptanesulfonate solution, Mobile phase, System suitability solution, and Chromatographic system*—Proceed as directed in the Assay.*Test solution*—Prepare as directed for *Test 1*.*Procedure*—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Clomipramine Hydrochloride taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all the peaks. Not more than 0.5% of any individual impurity is found; and not more than 2.0% of total impurities is found, the results for *Test 1* and *Test 2* being considered.**Assay—***Sodium 1-heptanesulfonate solution*—Transfer about 5.5 g of sodium 1-heptanesulfonate, accurately weighed, to a 100-mL volumetric flask, dissolve in 50.0 mL of water, and dilute with glacial acetic acid to volume.*Mobile phase*—Transfer 20.0 mL of *Sodium 1-heptanesulfonate solution* and 2.0 mL of triethylamine to a 500-mL volumetric flask, and dilute with water to volume. Transfer this solution to a 1-L volumetric flask, adjust with phosphoric acid to a pH of  $3.2 \pm 0.1$ , dilute with acetonitrile to volume, mix, filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).*System suitability solution*—Transfer about 7.0 mg of USP Desipramine Hydrochloride RS and 10.0 mg of USP Imipramine Hydrochloride RS, both accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.*Standard preparation*—Dissolve an accurately weighed quantity of USP Clomipramine Hydrochloride RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.8 mg per mL. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with methanol to volume, and mix.*Assay preparation*—Transfer about 80 mg of Clomipramine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 25-mL volumetric flask, dilute with methanol to volume, and mix.*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*; the relative retention times are about 0.85 for desipramine and 1.0 for imipramine; the resolution,  $R$ , between desipramine and imipramine is not less than 0.5; and the relative standard deviation for replicate injections is not more than 2.0%.*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{19}H_{23}ClN_2 \cdot HCl$  in the portion of Clomipramine Hydrochloride taken by the formula:

$$250C(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Clomipramine Hydrochloride RS in the *Standard preparation*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.**Clomipramine Hydrochloride Capsules**» Clomipramine Hydrochloride Capsules contain not less than 90.0 percent and not more than 110.0 percent of clomipramine hydrochloride ( $C_{19}H_{23}ClN_2 \cdot HCl$ ).**Packaging and storage**—Preserve in well-closed containers.**USP Reference standards** (11)—  
USP Clomipramine Hydrochloride RS**Identification, Infrared Absorption** (197K)—*Test specimen*—Transfer the contents of a number of Capsules, equivalent to about 125 mg of clomipramine hydrochloride, to a suitable container, add 25 mL of chloroform, stir for 5 minutes, and filter. Evaporate on a steam bath to a volume of about 5 mL, chill in an ice bath, add ethyl ether, and stir until crystals form. Filter, and dry at 100° for 1 hour.**Dissolution** (711)—*Medium:* 0.1 N hydrochloric acid; 500 mL.*Apparatus 2:* 50 rpm.*Time:* 30 minutes.*Procedure*—Determine the amount of  $C_{19}H_{23}ClN_2 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 252 nm on filtered portions of the solution under test, suitably diluted with *Dissolution*

*Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Clomipramine Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{19}H_{23}ClN_2 \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

PROCEDURE FOR CONTENT UNIFORMITY—

**Standard solution**—Prepare a solution of USP Clomipramine Hydrochloride RS in methanol having a known concentration of about 30 µg per mL.

**Test solution**—Quantitatively transfer the contents of 1 Capsule to a 100-mL volumetric flask with the aid of methanol, add about 75 mL of methanol, shake by mechanical means for 1 hour, and dilute with methanol to volume. Further dilute an aliquot of this solution quantitatively, and stepwise if necessary, with methanol to obtain a solution having a concentration of about 30 µg per mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* in 1-cm cells, at the wavelength of maximum absorbance at about 252 nm, with a suitable spectrophotometer, using methanol as the blank. Calculate the quantity, in mg, of clomipramine hydrochloride ( $C_{19}H_{23}ClN_2 \cdot HCl$ ) in the Capsule taken by the formula:

$$(TC/D)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of clomipramine hydrochloride in the Capsule; *C* is the concentration, in µg per mL, of USP Clomipramine Hydrochloride RS in the *Standard solution*; *D* is the concentration, in µg per mL, of clomipramine hydrochloride in the *Test solution*, based on the labeled quantity per Capsule and the extent of dilution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Test solution* and the *Standard solution*, respectively.

#### Assay—

*Sodium 1-heptanesulfonate solution, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Clomipramine Hydrochloride.

**Assay preparation**—Remove as completely as possible the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the contents, equivalent to about 160 mg of clomipramine hydrochloride, to a 200-mL volumetric flask, add 130 mL of methanol, shake by mechanical means for 1 hour, and dilute with methanol to volume. Transfer 10 mL of this solution to a 25-mL volumetric flask, dilute with methanol to volume, mix, and filter.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clomipramine hydrochloride ( $C_{19}H_{23}ClN_2 \cdot HCl$ ) in the portion of Capsules taken by the formula:

$$500C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Clomipramine Hydrochloride RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clonazepam

$C_{15}H_{10}ClN_3O_3$  315.71  
2H-1,4-Benzodiazepin-2-one, 5-(2-chlorophenyl)-1,3-dihydro-7-nitro-  
5-(o-Chlorophenyl)-1,3-dihydro-7-nitro-2H-1,4-benzodiazepin-2-one [1622-61-3].

» Clonazepam contains not less than 98.0 percent and not more than 102.0 percent of  $C_{15}H_{10}ClN_3O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, at room temperature.

**USP Reference standards** (11)—

USP Clonazepam RS

USP Clonazepam Related Compound A RS

3-Amino-4-(2-chlorophenyl)-6-nitrocarbostyryl.

$C_{15}H_{10}ClN_3O_3$  315.72

USP Clonazepam Related Compound B RS

2-Amino-2'-chloro-5-nitrobenzophenone.

$C_{13}H_9ClN_2O_3$  276.68

USP Clonazepam Related Compound C RS

2-Bromo-2'-(2-chlorobenzoyl)-4'-nitroacetanilide.

**Identification, Infrared Absorption** (197K).

**Melting range** (741): between 237° and 240°.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Limit of clonazepam related compound C—**

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Test solution**—Dissolve an accurately weighed quantity of Clonazepam in acetone to obtain a solution having a concentration of 25 mg per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Clonazepam Related Compound C RS in acetone to obtain a solution having a known concentration of 50 µg per mL.

**Application volume:** 20 µL.

**Developing solvent system:** a mixture of acetone and *n*-heptane (3:2).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). After air-drying the plate, heavily spray the plate with 2 M sulfuric acid, and dry at 105° for 15 minutes. Successively spray the plate with 0.01 M sodium nitrite, 9 mM ammonium sulfamate, and *N*-(1-naphthyl)ethylenediamine dihydrochloride TS, and dry the plate with a current of air. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with that of the principal spot in the chromatogram of the *Standard solution*: no secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from the *Standard solution* (0.2%).

**Related compounds—**

*Buffer solution, Mobile phase, Diluent, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay.

*Test preparation*—Use the *Assay preparation*.

*Procedure*—Inject a volume (about 50 µL) of the *Test preparation* into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Clonazepam taken by the formula:

$$100P_i / (r_c + \Sigma P_i)$$

in which *P* is the relative response factor, which is 1.84 for clonazepam related compound A, 0.94 for clonazepam related compound B, and 1 for all other impurities; *r<sub>i</sub>* is the peak response for each impurity obtained from the *Test preparation*; and *r<sub>c</sub>* is the peak response for clonazepam in the *Test preparation*: not more than 0.1% of clonazepam related compound A or of clonazepam related compound B is found, not more than 0.2% of any other impurity is found, and the sum of all other impurities is not more than 0.3%.

#### Assay—

*Buffer solution*—Transfer about 6.6 g of anhydrous dibasic ammonium phosphate to a 1-L volumetric flask, dissolve in 950 mL of water, adjust with 1 N phosphoric acid or 1 N sodium hydroxide to a pH of 8.0, dilute with water to volume, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of *Buffer solution*, methanol, and tetrahydrofuran (60:52:13). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of water, methanol, and tetrahydrofuran (60:52:13).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Clonazepam RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL.

*System suitability solution*—Dissolve suitable quantities of USP Clonazepam Related Compound A RS, USP Clonazepam Related Compound B RS, and USP Clonazepam RS in *Diluent* to obtain a solution containing about 0.04 mg per mL of each Reference Standard.

*Assay preparation*—Transfer about 10 mg of Clonazepam, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 2.2 for clonazepam related compound A, 2.5 for clonazepam related compound B, and 1.0 for clonazepam; and the resolution, *R<sub>s</sub>*, between clonazepam related compound A and clonazepam related compound B is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>15</sub>H<sub>10</sub>ClN<sub>3</sub>O<sub>3</sub> in the portion of Clonazepam taken by the formula:

$$100C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Clonazepam RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clonazepam Oral Suspension

### DEFINITION

Clonazepam Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of clonazepam (C<sub>15</sub>H<sub>10</sub>ClN<sub>3</sub>O<sub>3</sub>).

Prepare Clonazepam Oral Suspension 0.1 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Clonazepam	10 mg
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), NF, and Vehicle for Oral Suspension, NF, a sufficient quantity to make	100 mL

If using tablets, comminute the tablets into a fine powder in a suitable mortar, or add *Clonazepam* powder to the mortar. Add approximately 10 mL of the *Vehicle*, and mix to a uniform paste. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix well.

### ASSAY

#### PROCEDURE

*Mobile phase*: Methanol, acetonitrile, and water (30:30:40). Filter and degas.

*Standard solution*: 25 µg/mL of USP Clonazepam RS in acetonitrile

*Sample solution*: Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at −70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 2.5 mL of the *Sample solution* into a 10-mL volumetric flask, and dilute with acetonitrile to volume to obtain a solution having a nominal concentration of 25 µg/mL of clonazepam.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

*Mode*: LC

*Detector*: UV 254 nm

*Column*: 4.6-mm × 10-cm; 5-µm packing L1

*Flow rate*: 1 mL/min

*Injection volume*: 20 µL

#### System suitability

*Sample*: *Standard solution*

[NOTE—The retention time for clonazepam is about 7 min.]

#### Suitability requirements

*Relative standard deviation*: NMT 1.8% for replicate injections

#### Analysis

*Samples*: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of clonazepam (C<sub>15</sub>H<sub>10</sub>ClN<sub>3</sub>O<sub>3</sub>) in the portion of Oral Suspension taken:

$$\text{Result} = (r_u / r_s) \times (C_s / C_u) \times 100$$

*r<sub>u</sub>* = peak response from the *Sample solution*

*r<sub>s</sub>* = peak response from the *Standard solution*

*C<sub>s</sub>* = concentration of clonazepam in the *Standard solution* (µg/mL)

*C<sub>u</sub>* = nominal concentration of clonazepam in the *Sample solution* (µg/mL)

Acceptance criteria: 90.0%–110.0%

#### SPECIFIC TESTS

- **PH** (791): 3.6–4.6

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature or in a cold place.
- **LABELING:** Label it to state that it is to be well shaken before use, and to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded
- **USP REFERENCE STANDARDS** (11)  
USP Clonazepam RS

### Clonazepam Tablets

» Clonazepam Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clonazepam ( $C_{15}H_{10}ClN_3O_3$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, at room temperature.

#### USP Reference standards (11)—

- USP Clonazepam RS
- USP Clonazepam Related Compound A RS  
3-Amino-4-(2-chlorophenyl)-6-nitrocarbostyryl.  
 $C_{15}H_{10}ClN_3O_3$  315.72
- USP Clonazepam Related Compound B RS  
2-Amino-2'-chloro-5-nitrobenzophenone.  
 $C_{13}H_9ClN_2O_3$  276.68

#### Identification—

**A:** Place an amount of finely powdered Tablets, equivalent to about 10 mg of clonazepam, in a 125-mL separator. Add 25 mL of water, shake for 2 minutes, and extract with two 40-mL portions of chloroform. Pass the extracts through anhydrous sodium sulfate, combine them, and evaporate at room temperature with the aid of a stream of nitrogen to dryness. Wash the residue with three 10-mL portions of solvent hexane: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Clonazepam RS.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

*Medium:* degassed water; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 45 minutes.

Determine the amount of Clonazepam dissolved, using the following method.

**Mobile phase**—Prepare a filtered and degassed mixture of water, methanol, and acetonitrile (40:30:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Prepare a solution of USP Clonazepam RS in methanol having a known concentration of about 0.05 mg per mL. Quantitatively dilute a portion of this solution with *Dissolution Medium* to obtain a *Standard solution* having a known concentration similar to the expected concentration in the solution under test.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector

and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%; and the tailing factor is not more than 2.0.

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the solution under test into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity of  $C_{15}H_{10}ClN_3O_3$  dissolved by comparison of the peak responses obtained from the *Standard solution* and the test solution.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{15}H_{10}ClN_3O_3$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Related compounds—

*Buffer solution, Mobile phase, Diluent, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Clonazepam*.

**Test preparation**—Use the *Assay preparation*.

**Procedure**—Inject a volume (about 50 µL) of the *Test preparation* into the chromatograph, record the chromatogram, and measure the responses for all of the peaks. Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$100Pr_i / (r_c + \Sigma Pr_i)$$

in which *P* is the relative response factor, which is 2.45 for the peak with a relative retention time of 0.7 (if present), 1.84 for clonazepam related compound A, 0.94 for clonazepam related compound B, and 1 for all other impurities; *r<sub>i</sub>* is the peak response for each impurity obtained from the *Test preparation*; and *r<sub>c</sub>* is the peak response for clonazepam in the *Test preparation*: not more than 0.8% for the peak at relative retention time 0.7, not more than 0.4% of clonazepam related compound A, and not more than 1.0% of clonazepam related compound B are found; not more than 0.2% of any other impurity is found; and the sum of all other impurities is not more than 0.5%.

#### Assay—

*Buffer solution, Mobile phase, Diluent, Standard preparation, System suitability solution, and Chromatographic system*—Proceed as directed in the *Assay* under *Clonazepam*.

**Assay preparation**—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed amount of powder, equivalent to about 10 mg of clonazepam, to a 100-mL volumetric flask; dissolve, with sonication, in 75 mL of *Diluent*; cool to room temperature, dilute with *Diluent* to volume, mix, and filter, discarding the first few mL of the filtrate.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clonazepam ( $C_{15}H_{10}ClN_3O_3$ ) in the portion of Tablets taken by the formula:

$$100C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Clonazepam RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clonazepam Orally Disintegrating Tablets

» Clonazepam Orally Disintegrating Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clonazepam  $C_{15}H_{10}ClN_3O_3$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Clonazepam RS

USP Clonazepam Related Compound A RS

3-Amino-4-(2-chlorophenyl)-6-nitrocarbostyryl.

$C_{15}H_{10}ClN_3O_3$  315.72

USP Clonazepam Related Compound B RS

2-Amino-2'-chloro-5-nitrobenzophenone.

$C_{13}H_9ClN_2O_3$  276.68

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Disintegration** (701): not more than 60 seconds.

### Dissolution (711)—

*Medium:* water; 900 mL, degassed.

*Apparatus 2:* 50 rpm.

*Time:* 60 minutes.

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay*.

*Standard solution*—Quantitatively dilute with *Medium* the *Standard preparation* as directed in the *Assay* according to the Tablet strength. The final concentration of the *Standard solution* corresponding to each Tablet strength is given in Table 1.

Table 1

Tablet Strength mg per Tablet	Final Standard solution µg/mL of Clonazepam
0.125	0.125
0.25	0.25
0.5	0.50
1.0	1.0
2.0	2.0

*Test solution*—Pass a portion of the solution under test through a 0.45-µm nylon membrane filter, discarding the first few mL.

*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the clonazepam peak. Calculate the percentage of clonazepam dissolved by the formula:

$$\frac{r_U \times C_S \times 900 \times 100}{r_S \times L}$$

in which  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration of USP Clonazepam RS, in mg per mL, in the *Standard solution*; 900 is the volume of the *Medium*; and  $L$  is the Tablet label claim, in mg.

**Tolerances**—Not less than 75% (Q) of the labeled amount of clonazepam is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Related compounds—

*Mobile phase and Standard preparation*—Prepare as directed in the *Assay*.

*System suitability solution*—Dissolve weighed quantities of USP Clonazepam Related Compound A RS and USP Clonazepam Related Compound B RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 µg per mL each of USP Clonazepam Related Compound A RS and USP Clonazepam Related Compound B RS.

*Standard solution*—Quantitatively dilute with *Mobile phase* the *Standard preparation* to obtain a solution having a known concentration of about 0.2 µg per mL of clonazepam.

*Test solution*—Weigh and finely powder not fewer than 20 Tablets. Grind the Tablets into a fine powder and transfer an accurately weighed portion of the powder, equivalent to about 2 mg of clonazepam, to a 50-mL volumetric flask, pipet 20.0 mL of *Mobile phase* into the flask, and sonicate for about 2 minutes with intermittent shaking. DO NOT dilute to volume. Shake the flask for 30 minutes on a mechanical shaker. Pass a portion of this solution through a nylon membrane filter having a 0.45-µm or finer porosity, and use the filtrate after discarding the first 4 mL of the filtrate.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the *Assay*. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*. Identify the peaks due to clonazepam related compound A and clonazepam related compound B using the relative retention times given in Table 2; the resolution,  $R$ , between clonazepam related compound A and clonazepam related compound B is not less than 2.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for six replicate injections is not more than 6.0%.

*Procedure*—Separately inject equal volumes (about 100 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for at least four times the retention time of clonazepam, and measure the responses for all the peaks. [NOTE—Disregard any peaks with a retention time less than 3.5 minutes.] Calculate the percentage of each impurity in the portion of Tablets taken by the formula:

$$(C_S / C_T)(r_T / r_S)(1 / F)100$$

in which  $C_S$  is the concentration, in µg per mL, of USP Clonazepam RS in the *Standard solution*;  $C_T$  is the nominal concentration, in µg per mL, of clonazepam in the *Test solution*;  $r_T$  is the peak response of each impurity obtained from the *Test solution*;  $r_S$  is the peak response for clonazepam obtained from the *Standard solution*; and  $F$  is the relative response factor for the impurity given in Table 2. The limits of each impurity along with relative retention times and relative response factors are given in Table 2.

Table 2

Peak ID	Relative Retention Time	Relative Response Factor	Limit % (w/w)
Clonazepam	1.0	1.0	—
Clonazepam related compound A <sup>1</sup>	1.71	0.67	0.4
Clonazepam related compound B <sup>2</sup>	2.25	0.79	1.0

<sup>1</sup>3-Amino-4-(2-chlorophenyl)-6-nitrocarbostyryl.

<sup>2</sup>2-Amino-2'-chloro-5-nitrobenzophenone.

Table 2 (Continued)

Peak ID	Relative Retention Time	Relative Response Factor	Limit % (w/w)
Any other unspecified degradation product	—	1.0	0.2
Total impurities	—	—	2.0

<sup>1</sup>3-Amino-4-(2-chlorophenyl)-6-nitrocarbostryl.<sup>2</sup>2-Amino-2'-chloro-5-nitrobenzophenone.**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and methanol (2:1:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Clonazepam RS in *Mobile phase*, and dilute, if necessary, to obtain a solution having a known concentration of about 0.01 mg per mL of USP Clonazepam RS.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2 mg of clonazepam, to a 200-mL volumetric flask, add 120 mL of *Mobile phase*, and sonicate for about 15 minutes with intermittent shaking. Shake the flask on a mechanical shaker for about 30 minutes. Dilute with *Mobile phase* to volume, and mix. Pass a portion of this solution through a nylon membrane filter having a 0.45-μm or finer porosity, and use the filtrate after discarding the first 4 mL of the filtrate. [NOTE—The solution is stable for 48 hours at room temperature.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L7. The flow rate is about 1.2 mL per minute. The column temperature is maintained at 30°. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not fewer than 2000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 60 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the clonazepam peak. Calculate the quantity, in percentage, of label claim of clonazepam (C<sub>15</sub>H<sub>10</sub>ClN<sub>3</sub>O<sub>3</sub>) in the portion of Tablets taken by the formula:

$$(C_s / C_u)(r_u / r_s)100$$

in which  $C_s$  is the concentration, in mg per mL, of USP Clonazepam RS in the *Standard solution*;  $C_u$  is the nominal concentration based on label claim, in mg per mL, of clonazepam in the *Assay preparation*;  $r_u$  is the peak response for clonazepam obtained from the *Assay preparation*; and  $r_s$  is the peak response for clonazepam obtained from the *Standard preparation*.

**Clonidine**

C<sub>9</sub>H<sub>9</sub>Cl<sub>2</sub>N<sub>3</sub> 230.09  
Benzenamine, 2,6-dichloro-N-2-imidazolidinylidene-;  
2-[(2,6-Dichlorophenyl)imino]imidazolidine [4205-90-7].

**DEFINITION**

Clonidine contains NLT 99.0% and NMT 101.0% of clonidine (C<sub>9</sub>H<sub>9</sub>Cl<sub>2</sub>N<sub>3</sub>), calculated on the dried basis.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** <197K>• **B. ULTRAVIOLET ABSORPTION** <197U>

**Medium:** 0.01 N hydrochloric acid

**Sample solution:** 0.3 mg/mL of Clonidine in *Medium*

**Acceptance criteria:** Absorptivities are about 2.1 and 1.8 for the maxima at 271 and 279, respectively, calculated on the dried basis.

**ASSAY**• **PROCEDURE**

**Sample solution:** 190 mg of Clonidine in 100 mL of glacial acetic acid

**Analysis:** Titrate with 0.1 N perchloric acid VS, using a silver-silver chloride glass combination electrode with liquid junction. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each mL of 0.1 N perchloric acid is equivalent to 23.01 mg of clonidine (C<sub>9</sub>H<sub>9</sub>Cl<sub>2</sub>N<sub>3</sub>).

**Acceptance criteria:** 99.0%–101.0% on the dried basis

**IMPURITIES**• **RESIDUE ON IGNITION** <281>

**Analysis:** Ignite at 500 ± 25° to constant weight.

**Acceptance criteria:** NMT 0.1%

• **HEAVY METALS, Method II** <231>: NMT 10 μg/g• **ORGANIC IMPURITIES**

**1 M phosphoric acid:** 115 g/L of phosphoric acid in water

**Buffer:** 4 g/L of monobasic potassium phosphate in water. Adjust with 1 M phosphoric acid to a pH of 4.0.

**Solution A:** Acetonitrile and *Buffer* (75:25)

**Mobile phase:** See Table 1.

Table 1

Time (min)	Buffer (%)	Solution A (%)
0	90	10
15	30	70
15.1	90	10
20	90	10

**Acetylclonidine solution:** 0.05 mg/mL of USP Clonidine Related Compound A RS, prepared as follows. Initially dissolve USP Clonidine Related Compound A RS in acetonitrile (1 mg/mL), and dilute with *Buffer* to volume.

**System suitability solution:** 0.86 mg/mL of USP Clonidine RS and 0.86 μg/mL of clonidine related compound A from *Acetylclonidine solution* in *Buffer*

**Standard solution:** 8.6 μg/mL of USP Clonidine RS in *Buffer*

**Sample solution:** 0.86 mg/mL of Clonidine in *Buffer*

**Blank:** *Buffer*

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 3.0-mm × 15-cm; 5-μm packing L56

**Column temperature:** 40°

**Flow rate:** 1.5 mL/min

**Injection volume:** 5 μL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

**Suitability requirements**

**Resolution:** NLT 5 between clonidine and acetylclonidine, *System suitability solution*

**Tailing factor:** NMT 2.5 for clonidine, *System suitability solution*

Relative standard deviation: NMT 5%, *Standard solution*

#### Analysis

**Samples:** *Standard solution*, *Sample solution*, and *Blank*. Calculate the percentage of each impurity in the portion of Clonidine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for each impurity from the *Sample solution*

$r_S$  = peak response of clonidine from the *Standard solution*

$C_S$  = concentration of the *Standard solution* ( $\mu\text{g/mL}$ )

$C_U$  = concentration of the *Sample solution* ( $\mu\text{g/mL}$ )

#### Acceptance criteria

**Individual impurity:** NMT 0.1%

**Total impurities:** NMT 0.2%

#### SPECIFIC TESTS

##### • LOSS ON DRYING (731)

**Analysis:** Dry a sample at 60° under vacuum to constant weight.

**Acceptance criteria:** NMT 0.5%

##### • APPEARANCE OF SOLUTION

#### Color of solution

**Standard solution:** 4.8  $\mu\text{g/mL}$  of potassium chromate in water

**Sample solution:** 100 mg/mL in methanol

**Acceptance criteria:** The color of 10 mL of *Sample solution* is not more intense than that of 10 mL of *Standard solution* when compared in matched color-comparison tubes (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

#### Turbidity

**Sample solution:** Prepare as directed in *Color of solution*.

**Acceptance criteria:** 10 mL of *Sample solution* has no more turbidity than 10 mL of methanol when compared in matched color-comparison tubes (see *Spectrophotometry and Light-Scattering* (851), *Visual Comparison*).

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at room temperature.

##### • USP REFERENCE STANDARDS (11)

USP Clonidine RS

USP Clonidine Related Compound A RS

1-Acetyl-2-(2,6-dichlorophenylamino)-2-(4,5-dihydroimidazol).

$\text{C}_{11}\text{H}_{11}\text{Cl}_2\text{N}_3\text{O}$  272.13

#### USP Reference standards (11)—

USP Clonidine Hydrochloride RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 330  $\mu\text{g}$  per mL.

*Medium:* 0.01 N hydrochloric acid.

Absorptivities at 272 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** It responds to the tests for *Chloride* (191).

**pH** (791): between 3.5 and 5.5, in a solution (1 in 20).

**Loss on drying** (731)—Dry it at 105° to constant weight; it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—Dissolve 200 mg in methanol, and dilute with methanol to 2.0 mL to obtain the test solution. Dissolve a suitable quantity of USP Clonidine Hydrochloride RS in methanol to obtain a *Standard solution* having a known concentration of 100 mg per mL. Dilute a portion of this solution quantitatively and stepwise with methanol to obtain a diluted *Standard solution* having a concentration of 100  $\mu\text{g}$  per mL. Apply separate 2- $\mu\text{L}$  portions of the test solution, the *Standard solution*, and the diluted *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a freshly prepared solvent system consisting of a mixture of toluene, dioxane, dehydrated alcohol, and ammonium hydroxide (10:8:2:1), until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the chamber, allow the solvent to evaporate, and dry it at 100° for 1 hour. Dip the plate into a dipping chamber filled to three-fourths of its height with sodium hypochlorite solution, diluted to contain 0.5% available chlorine, dry in a fume hood with a current of air for 1 hour, and spray with starch-potassium iodide TS: the  $R_F$  value of the principal spot from the test solution corresponds to that of the *Standard solution*. Any other spot obtained from the test solution does not exceed, in size or intensity, the principal spot obtained from the diluted *Standard solution* (0.1%), and the total of any spots does not exceed 0.2%.

**Assay**—Dissolve about 200 mg of Clonidine Hydrochloride, accurately weighed, in about 80 mL of glacial acetic acid, add 15 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass electrode and a sleeve-type calomel electrode containing 0.1 N lithium perchlorate in glacial acetic acid (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 26.66 mg of  $\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3 \cdot \text{HCl}$ .

## Clonidine Hydrochloride

$\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3 \cdot \text{HCl}$  266.55

Benzenamine, 2,6-dichloro-N-2-imidazolidinylidene-, monohydrochloride.

2-[(2,6-Dichlorophenyl)imino]imidazolidine monohydrochloride [4205-91-8].

» Clonidine Hydrochloride contains not less than 98.5 percent and not more than 101.0 percent of  $\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3 \cdot \text{HCl}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers. Store at 25°, excursions permitted between 15° and 30°.

## Clonidine Hydrochloride Tablets

#### DEFINITION

Clonidine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clonidine hydrochloride ( $\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3 \cdot \text{HCl}$ ).

#### IDENTIFICATION

• **A.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

##### • B. THIN-LAYER CHROMATOGRAPHY

**Standard solution:** 10 mg/mL of USP Clonidine Hydrochloride RS in methanol

**Sample solution:** Transfer an equivalent to 1 mg of clonidine hydrochloride, from a quantity of finely powdered Tablets, to a separator containing 30 mL of water

and 5 mL of 1 N sodium hydroxide. Swirl gently to dissolve the sample specimen, and extract with 20 mL of chloroform. Allow the layers to separate, and filter the chloroform extract. Evaporate the filtrate to dryness, and dissolve the residue in 0.1 mL of methanol.

#### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 2  $\mu$ L

**Developing solvent system:** Methanol and ammonium hydroxide (200:3)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed in the chapter. Position the plate in a chromatographic chamber, and develop in *Developing solvent system* until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light.

**Acceptance criteria:** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to that of the *Standard solution*.

#### ASSAY

##### • PROCEDURE

**Solution A:** 2.2 mg/mL of sodium 1-octanesulfonate in water

**Mobile phase:** Methanol, *Solution A*, and phosphoric acid (500:500:1). Adjust with 1 N sodium hydroxide to a pH of 3.0, and pass through a suitable filter of 0.45- $\mu$ m pore size.

**2,6-Dichloroaniline stock solution:** 12  $\mu$ g/mL of 2,6-dichloroaniline in *Mobile phase*

**Standard stock solution:** 100  $\mu$ g/mL of USP Clonidine Hydrochloride RS in *Mobile phase*

**Standard solution:** 1  $\mu$ g/mL of clonidine hydrochloride from the *Standard stock solution* in *Mobile phase*

**System suitability solution:** 2  $\mu$ g/mL of USP Clonidine Hydrochloride RS and 2.4  $\mu$ g/mL of 2,6-dichloroaniline in *Mobile phase*, from the *Standard stock solution* and *2,6-Dichloroaniline stock solution*, respectively

**Sample solution:** Weigh and finely powder NLT 20 Tablets. Transfer the equivalent to 0.1 mg of clonidine hydrochloride from powder to a 100-mL volumetric flask. Add about 60 mL of *Mobile phase*, shake by mechanical means for 15–30 min, dilute with *Mobile phase* to volume, and mix. Centrifuge a portion of this solution to obtain a clear solution.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm  $\times$  15-cm; packing L7, deactivated for basic compounds

**Flow rate:** 1.5 mL/min

**Injection volume:** 50  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for clonidine and 2,6-dichloroaniline are about 0.5 and 1.0, respectively.]

#### Suitability requirements

**Tailing factor:** NMT 1.5 for the clonidine peak, *System suitability solution*

**Column efficiency:** NLT 3500 theoretical plates for the clonidine peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for the clonidine peak, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of clonidine hydrochloride ( $C_9H_9Cl_2N_3 \cdot HCl$ ) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* ( $\mu$ g/mL)

$C_U$  = nominal concentration of clonidine hydrochloride in the *Sample solution* ( $\mu$ g/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** 0.01 N hydrochloric acid; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Standard solution:** Proceed as directed in the *Assay*, except use *Medium* instead of *Mobile phase*.

**Analysis:** Proceed as directed in the *Assay*.

**Tolerances:** NLT 75% (Q) of the labeled amount of clonidine hydrochloride ( $C_9H_9Cl_2N_3 \cdot HCl$ ) is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS <11>**  
USP Clonidine Hydrochloride RS

## Clonidine Hydrochloride and Chlorthalidone Tablets

#### DEFINITION

Clonidine Hydrochloride and Chlorthalidone Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) and NLT 90.0% and NMT 110.0% of the labeled amount of clonidine hydrochloride ( $C_9H_9Cl_2N_3 \cdot HCl$ ).

#### IDENTIFICATION

##### • A.

**Sample solution:** Transfer an amount of powdered Tablets, equivalent to 3 mg of clonidine hydrochloride, to a beaker. Add 30 mL of water, stir for 5 min, and pass through a filter of medium pore size into a sintered-glass funnel. Transfer the filtrate to a separator, add 5 mL of 0.1 N sodium hydroxide, and extract with 20 mL of chloroform, collecting the chloroform extract in a separator. Extract the chloroform phase with 15 mL of 0.01 N hydrochloric acid, collecting the acid extract in a beaker. Remove any residual chloroform from the acid extract by heating on a steam bath.

**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Clonidine Hydrochloride RS, concomitantly measured.

##### • B. INFRARED ABSORPTION

**Sample:** Transfer 10 powdered Tablets to a 50-mL beaker. Add 10 mL of methanol, boil on a steam bath for 5 min, and filter. Add 20 mL of water to the filtrate, and boil on a steam bath for 5 min under a current of air. Cool, with stirring, in ice until crystals form. Filter the crystals, and dry at 105° for 1 h.

**Acceptance criteria:** The IR absorption spectrum of a mineral oil dispersion of the *Sample* exhibits maxima only at the same wavelengths as that of a similar preparation of USP Chlorthalidone RS.

- **C.** The retention times of the chlorthalidone and clonidine hydrochloride peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer:** 1 g/L of monobasic ammonium phosphate in water

**Mobile phase:** Methanol, acetonitrile, and *Buffer* (100:100:800)

**Clonidine hydrochloride standard stock solution:** 1500/μg/mL of USP Clonidine Hydrochloride RS in *Buffer*; *J* is the ratio of the labeled amount, in mg, of clonidine hydrochloride to the labeled amount, in mg, of chlorthalidone per Tablet.

**Standard solution:** 150/μg/mL of USP Clonidine Hydrochloride RS and 150 μg/mL of USP Chlorthalidone RS prepared as follows. Transfer 15 mg of USP Chlorthalidone RS to a 100-mL volumetric flask, dissolve in 10 mL of methanol, and add 25 mL of *Buffer* and 10.0 mL of *Clonidine hydrochloride standard stock solution*. Dilute with *Buffer* to volume.

**Sample solution:** Transfer an amount equivalent to 15 mg of chlorthalidone from powdered Tablets (NLT 20). Add 10 mL of methanol, and sonicate for 5 min. Add 40 mL of *Buffer*, and sonicate until the solution is free from agglomerates. Allow to cool to ambient temperature, dilute with *Buffer* to volume, and centrifuge.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 10-cm; packing L7

**Flow rate:** 2 mL/min

**Injection volume:** 20 μL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The relative retention times for clonidine hydrochloride and chlorthalidone are about 0.2 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3 between the clonidine hydrochloride and chlorthalidone peaks

**Relative standard deviation:** NMT 2%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amounts of clonidine hydrochloride ( $C_9H_9Cl_2N_3 \cdot HCl$ ) and chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of clonidine hydrochloride or chlorthalidone from the *Sample solution*

$r_S$  = peak response of clonidine hydrochloride or chlorthalidone from the *Standard solution*

$C_S$  = concentration of USP Clonidine Hydrochloride RS or USP Chlorthalidone RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of clonidine hydrochloride or chlorthalidone in the *Sample solution* (μg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**• **DISSOLUTION** <711>

**Medium:** Water; 900 mL

**Apparatus 2:** 100 rpm

**Time:** 60 min

**Sample solution:** Pipet 20 mL of a centrifuged portion of the solution under test into a 25-mL volumetric flask, and dilute with 0.5% monobasic ammonium phosphate

solution to volume. Use the resulting solution as the *Sample solution*.

**Analysis:** Proceed as directed in the *Assay*, making any necessary volumetric adjustments.

**Tolerances:** NLT 50% (Q) of the labeled amount of chlorthalidone ( $C_{14}H_{11}ClN_2O_4S$ ) and NLT 80% (Q) of the labeled amount of clonidine hydrochloride ( $C_9H_9Cl_2N_3 \cdot HCl$ ) are dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements for *Content Uniformity* with respect to both clonidine hydrochloride and chlorthalidone

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS** <11>

USP Chlorthalidone RS

USP Clonidine Hydrochloride RS

**Clonidine Transdermal System****DEFINITION**

Clonidine Transdermal System contains NLT 80.0% and NMT 120.0% of the labeled amount of clonidine ( $C_9H_9Cl_2N_3$ ). [NOTE—Throughout the following procedures, avoid the use of tetrahydrofuran stabilized with butylated hydroxytoluene (BHT). In the presence of peroxides, BHT may react with clonidine, producing impurity peaks.]

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** <197K>

**Buffer solution:** 242.28 g/L of tris-(hydroxymethyl)aminomethane in water. Adjust with dilute hydrochloric acid to a pH of 9.2.

**Sample:** Carefully peel the release liner from each Transdermal System, and place a number of Transdermal Systems equivalent to 25 mg of clonidine into a 50-mL screw-capped centrifuge tube. Add 5 mL of chloroform, and mix on a vortex mixer for 5 min. Allow to stand for 30 min, and mix intermittently on a vortex mixer.

Transfer the chloroform solution to another 50-mL centrifuge tube, and wash the residue with an additional 3 mL of chloroform, combining the extracts. Add 2 mL of 0.5 N hydrochloric acid to the extract, mix on a vortex mixer for 1 min, and centrifuge at about 1000 rpm for 4 min. Remove and discard the bottom chloroform layer. Extract the aqueous layer with 4 mL of chloroform. Centrifuge at 1000 rpm for an additional 5 min, and again discard the bottom chloroform layer. Add 5 mL of *Buffer solution* and 3 mL of methylene chloride. Mix on a vortex mixer for 1 min. Centrifuge at 1000 rpm for 4 min. Transfer the bottom methylene chloride layer into a 100-mL beaker, and dry the methylene chloride with anhydrous sodium sulfate (about 1/4 liquid height). Decant, and evaporate to dryness with a stream of nitrogen. Dry at 105° for 30 min, and allow to cool in a desiccator.

**Analysis:** Determine the IR spectrum of the *Sample solution* and USP Clonidine RS in the wavelength region of 3500–600 cm<sup>-1</sup>.

**Acceptance criteria:** Meets the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**• **PROCEDURE**

**Buffer solution:** 2.5 mL of triethylamine in 1 L of water. Adjust with phosphoric acid to a pH of 3.0.

**Mobile phase:** Acetonitrile and *Buffer solution* (60:40).  
[NOTE—Stir the solution for 30 min.]

**Diluent:** Tetrahydrofuran and methanol (1:1)

**System suitability solution:** 250 µg/mL of USP Clonidine RS and 10 µg/mL of USP Clonidine Related Compound B RS in *Diluent*

**Standard stock solution:** 1 mg/mL of USP Clonidine RS in tetrahydrofuran

**Standard solutions:** Prepare a minimum of four *Standard solutions* from the *Standard stock solution* in *Diluent* that bracket the expected clonidine concentration in the sample. The standard concentrations should be within the range of 50–300 µg/mL. [NOTE—The *Standard solutions* are stable for up to 2 days if stored at 4°.]

**Sample solution:** 357 µg/mL of clonidine prepared as follows. Remove each Transdermal System from its package, discard the release liner from each system, and transfer into a 50-mL centrifuge tube with a Teflon-lined screw cap. Add the appropriate volume of tetrahydrofuran as listed in *Table 1*.

**Table 1**

For systems containing about 2.5 mg of clonidine	7.0 mL
For systems containing about 5.0 mg of clonidine	14.0 mL
For systems containing about 7.5 mg of clonidine	21.0 mL

Mix vigorously on a vortex mixer until the systems are washed down and fully submerged in the tetrahydrofuran. Let the systems soak in tetrahydrofuran for about 5 min, and mix on a vortex mixer until the systems are completely delaminated. Allow the systems to remain submerged for an additional 60 min, mixing on a vortex mixer every 30 min. Add methanol in a volume equal to the volume of tetrahydrofuran, and mix vigorously on a vortex mixer. The solution turns milky. Centrifuge for 10 min at 2000 rpm. Use the supernatant as the *Sample solution*.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 and 242 nm

[NOTE—The detector is programmed initially to 242 nm and switched to 210 nm after the elution of the clonidine peak but before the elution of the clonidine related compound B peak.]

**Column:** 4.6-mm × 15-cm; packing L10

**Flow rate:** 1 mL/min

**Injection size:** 25 µL

#### System suitability

**Sample:** *System suitability solution*

[NOTE—The relative retention times for clonidine and clonidine related compound B are 1.0 and 1.5, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between clonidine and clonidine related compound B

**Capacity factor (*k'*):** NLT 0.6 for clonidine

**Tailing factor:** NMT 3.0 for both clonidine and clonidine related compound B

**Relative standard deviation:** NMT 2.0% for the clonidine peak area

#### Analysis

**Samples:** At least three *Standard solutions* that will bracket the expected sample concentration range and the *Sample solution*

Calculate the peak response ratios of the analyte, and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient: it should be NLT 0.995.

Calculate the percentage of the labeled amount of clonidine (C<sub>9</sub>H<sub>9</sub>Cl<sub>2</sub>N<sub>3</sub>) in the Transdermal System taken:

$$\text{Result} = (C_s/C_u) \times 100$$

C<sub>s</sub> = concentration of clonidine from the linear regression analysis (µg/mL)

C<sub>u</sub> = nominal concentration of clonidine in the *Sample solution* (µg/mL)

**Acceptance criteria:** 80.0%–120.0%

## PERFORMANCE TESTS

### • DRUG RELEASE <724>

#### Test 1

**Medium:** 0.001 M phosphoric acid; 80 mL for systems containing 5 mg or less of clonidine; 200 mL for systems containing more than 5 mg of clonidine

**Times:** 8, 24, 96, and 168 h

**Apparatus 7:** Proceed as directed in the chapter, using the transdermal system holder-angled disk (see *Figure 4a*). The appropriate size of the holder, 1.42 or 1.98 inches, should be chosen based on the size of the system to prevent overhang. Use 100-mL beakers for *Medium* volumes of 80 mL and 300-mL beakers for *Medium* volumes of 200 mL. Gently press the Transdermal System to a dry, smooth, square piece of cellulose membrane, or equivalent, with the adhesive side against the membrane. Attach the membrane/system to a suitable inert sample holder with a Viton O-ring, or equivalent, so that the backing of the system is adjacent to and centered on the bottom of the sample holder. Trim the excess cellulose membrane with scissors. Suspend each sample holder from the arm of a reciprocating shaker so that each system is continuously immersed in a beaker containing the specified volume of *Medium*. The filled beakers are weighed and pre-equilibrated to 32.0 ± 0.3° before immersing the test sample. Agitate the sample in an up-down motion at a frequency of 30 cycles/min with an amplitude of 2.0 ± 0.1 cm. The *Medium* must be added daily to the beakers during each interval to maintain sample immersion. At the end of each time interval, transfer the test sample to a fresh beaker containing the appropriate volume of *Medium*, weighed and pre-equilibrated to 32.0 ± 0.3°.

**Mobile phase:** 0.1% solution of triethylamine in a mixture of methanol and water (30:70). Adjust with phosphoric acid to a pH of 6.0 ± 0.2.

**System suitability solution:** 10 µg/mL of USP Clonidine RS in 0.001 M phosphoric acid

**Standard solutions:** Prepare a minimum of four *Standard solutions* of USP Clonidine RS in 0.001 M phosphoric acid having known concentrations of clonidine similar to those of the *Sample solutions*.

**Sample solutions:** At the end of each release interval, allow the beakers to cool to room temperature, and make up for evaporative *Medium* losses by adding *Medium* to obtain the original weight, then mix.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 25 µL

#### System suitability

**Sample:** *System suitability solution*

#### Suitability requirements

**Column efficiency:** NLT 2000 theoretical plates

**Tailing factor:** NMT 2.0

**Capacity factor ( $k'$ ):** NLT 0.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solutions* and *Sample solutions*  
Construct a standard curve of concentration ( $\mu\text{g/mL}$ ) of clonidine in the *Standard solutions* versus peak area by linear regression analysis. The correlation coefficient is NLT 0.995.

Calculate the release rate of clonidine:

$$\text{Result} = CV/TA$$

$C$  = concentration of clonidine in the sample of the standard curve ( $\mu\text{g/mL}$ )

$V$  = volume of the *Medium* (mL)

$T$  = time (h)

$A$  = area of the Transdermal System ( $\text{cm}^2$ )

**Tolerances:** See *Table 2*.

**Table 2**

Time (h)	Time for Sampling (h)	Release Rate ( $\mu\text{g/h/cm}^2$ )
0–8	8	7.5–16.0
8–24	24	1.5–4.6
24–96	96	1.5–4.6
96–168	168	1.5–3.3

The release rate of clonidine ( $\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3$ ) from the Transdermal System, expressed as  $\mu\text{g/h/cm}^2$  at the times specified, conforms to *Acceptance Table 1* in <724>.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 2*.

**Medium:** 0.01 N hydrochloric acid; 500 mL for systems labeled as 0.1 mg/day, 900 mL for systems labeled as 0.2 or 0.3 mg/day

**Apparatus 6:** 100 rpm. Apply double-sided tape around the lower-most circumference of the cylinder, overlapping the ends to prevent peeling of the tape end from the cylinder. Remove the outer layer of the tape. Attach the Transdermal System to the cylinder with the backing side against the double-sided tape and the longitudinal axis parallel to the bottom of the cylinder. Carefully smooth the system to remove any air bubbles, and remove the release liner from the system. For systems requiring 500 mL of *Medium*, apply the double-sided tape to the system such that the bottom edge of each is NMT 2 mm from the bottom of the cylinder to prevent evaporation during the test from exposure to air. After setting the cylinder in the vessel, cover the vessel to minimize evaporation.

**Times:** 6, 48, 96, and 168 h

**Buffer:** 0.3% triethylamine in 0.025 M monobasic potassium phosphate. Adjust with phosphoric acid to a pH of  $6.20 \pm 0.10$ .

**Mobile phase:** *Buffer* and tetrahydrofuran (94:6)

**Standard solutions:** Solutions containing 0.7, 3.0, 5.3, 7.5, and 9.8  $\mu\text{g/mL}$  of USP Clonidine RS in *Medium*. A small amount of methanol (not exceeding 10% of the final volume) can be used to solubilize clonidine.

**Sample solution:** 1.5 mL aliquots of the solution under test. After sampling the last time point, measure the volume of *Medium* remaining in the vessel.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

#### Columns

**Guard:** 3.0-mm  $\times$  4-mm; packing L1

**Analytical:** 4.6-mm  $\times$  15-cm; packing L1

**Flow rate:** 1.0 mL/min

**Injection size:** 50  $\mu\text{L}$

#### System suitability

**Sample:** 5.3  $\mu\text{g/mL}$  of the *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 3.0%

#### Analysis

**Samples:** *Standard solutions* and *Sample solutions*  
Construct a standard curve of concentration ( $\mu\text{g/mL}$ ) of clonidine in the *Standard solutions* versus peak area by linear regression analysis. The correlation coefficient is NLT 0.997. Calculate the release rate of clonidine. Calculate the volume loss rate in mL/h ( $L$ ):

$$L = [V - F + (N \times 1.5)]/T$$

$V$  = initial volume of *Medium* (mL)

$F$  = final volume of *Medium* (mL)

$N$  = number of sampling time points

$T$  = total elapsed time between start of run and final volume measurement (h)

Calculate the volume (mL) at each sampling time adjusted for evaporation ( $V_{adj}$ ):

$$V_{adj} = V - (L \times t_c) - [(n - 1) \times 1.5]$$

$t_c$  = cumulative time for the sample withdrawal (6, 48, 96, or 168 h)

$n$  = sampling number (1, 2, 3, or 4 for the 6-, 48-, 96-, and 168-h sampling times, respectively)

Calculate the release rate of clonidine ( $\mu\text{g/h/cm}^2$ ):

$$\text{Result} = [(r_u - b) \times V_{adj}]/(m \times A \times t_i)$$

$r_u$  = peak response from the *Sample solution*

$b$  = y-intercept of the standard curve

$m$  = slope of the standard curve

$A$  = area of the system ( $\text{cm}^2$ )

$t_i$  = interval time (h)

**Tolerances:** See *Table 3*.

**Table 3**

Time (h)	Time for Sampling (h)	Interval Time (h)	Release Rate ( $\mu\text{g/h/cm}^2$ )
0–6	6	6	7.6–12.0
6–48	48	42	1.7–2.5
48–96	96	48	2.0–2.9
96–168	168	72	1.7–2.6

The release rate of clonidine ( $\text{C}_9\text{H}_9\text{Cl}_2\text{N}_3$ ) from the Transdermal System, expressed as  $\mu\text{g/h/cm}^2$  at the times specified, conforms to *Acceptance Table 1* in <724>.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Drug Release Test 3*.

**Medium:** 100 mM acetate buffer, pH 5.0, with 0.01% of cetyltrimethylammonium bromide (13.6 g/L of sodium acetate monohydrate in water, adjust with glacial acetic acid to a pH of 5.0, and add 0.1 g/L of cetyltrimethylammonium bromide); 900 mL

**Apparatus 5:** 100 rpm, with the 76-mm disk

**Times:** 8, 24, 96, and 168 h

**Solution A:** 2.4 g/L of octanesulfonic acid sodium salt and 2 mL/L of phosphoric acid in water

**Mobile phase:** Methanol and *Solution A* (45:55). Adjust with 10 N sodium hydroxide to a pH of 3.0.

**Standard stock solution:** 1 mg/mL of USP Clonidine RS in methanol

**Standard solution:** Dilute the *Standard stock solution* with *Medium* to obtain a final concentration similar to the expected concentration in the *Sample solution*, considering complete drug release.

**Sample solution:** Apply double-sided adhesive tape to the stainless steel disk to cover enough of the disk area so that the entire patch is secured by the tape. Apply a Transdermal System with the release liner intact to the adhesive layer on the stainless steel disk. Press the backing film of the patch to the adhesive tape with the clear release liner film of the system facing up. Peel the release liner from the affixed system on the disk assembly, and place the disk assembly flat on the bottom of the vessel with the exposed transdermal adhesive side up and parallel to the bottom edge of the paddle blade. Lower the paddle, and start the equipment. At each sampling time withdraw an appropriate volume of the solution under test.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 220 nm

**Column:** 4.6-mm × 15-cm; packing L7

**Column temperature:** 30°

**Flow rate:** 1.5 mL/min

**Injection size:** 30 µL

#### System suitability

**Sample:** *Standard solution*

**Suitability requirements**

**Tailing factor:** NMT 1.8

**Relative standard deviation:** NMT 2.0%

#### Analysis:

**Samples:** *Standard solution* and *Sample solution*

Calculate the concentration ( $C_i$ ) of clonidine ( $C_9H_9Cl_2N_3$ ) in the *Medium* (mg/mL) at each time point:

$$C_i = (r_U/r_S) \times C_S$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$i$  = interval, where  $i = 1$  at 8 h,  $i = 2$  at 24 h,  $i = 3$  at 96 h,  $i = 4$  at 168 h

Calculate the rate of clonidine ( $C_9H_9Cl_2N_3$ ) released in µg/h/cm<sup>2</sup> at each time point:

$$\text{Result} = [(C_i - C_{i-1}) \times V_i \times 1000] / [S \times (T_i - T_{i-1})]$$

$$V_i = V_0 - [(i - 1) \times V_A]$$

$V_i$  = volume of *Medium* at a given time point

$V_0$  = initial volume of *Medium*, 900 mL

$V_A$  = volume of *Medium* withdrawn at each time point

1000 = conversion factor from mg to µg

$S$  = system size in cm<sup>2</sup>

$T_i$  = current time point

$T_{i-1}$  = previous time point

**Tolerances:** See *Table 4*.

**Table 4**

Time (h)	Release Rate (µg/h/cm <sup>2</sup> )
8	6.5–11.0
24	2.5–5.5
96	2.5–5.0
168	2.0–3.8

The release rate of clonidine ( $C_9H_9Cl_2N_3$ ) from the Transdermal System, expressed as µg/h/cm<sup>2</sup> at the times specified, conforms to *Acceptance Table 1* in <724>.

- UNIFORMITY OF DOSAGE UNITS** <905>: Meets the requirements

## IMPURITIES

### • ORGANIC IMPURITIES

**Mobile phase, Diluent, System suitability solution, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard stock solution:** 1 mg/mL of USP Clonidine Related Compound B RS in tetrahydrofuran

**Standard solutions:** Prepare a minimum of four *Standard solutions* in *Diluent* that bracket the expected clonidine related compound B concentration in the sample. The standard concentrations should be within the range of 0.2–10.0 µg/mL.

[NOTE—The *Standard solutions* are stable for up to 2 days if stored at 4°.]

#### Analysis

**Samples:** At least three *Standard solutions* that will bracket the expected sample concentration range and the *Sample solution*

Measure the responses for clonidine related compound B. Calculate the peak response ratios of the analyte, and plot the results. Determine the linear regression equation of the standards by the mean-square method, and record the linear regression equation and the correlation coefficient: it should be NLT 0.995. Determine the concentration of clonidine related compound B.

Calculate the amount, in µg/cm<sup>2</sup>, of clonidine related compound B in the portion of the Transdermal System taken:

$$\text{Result} = CV/A$$

$C$  = concentration of clonidine related compound B from the linear regression analysis (µg/mL)

$V$  = volume of the *Sample solution* (mL)

$A$  = area of the sample system (cm<sup>2</sup>)

**Acceptance criteria:** NMT 10.0 µg/cm<sup>2</sup>

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in sealed, single-dose containers at a temperature not exceeding 30°.

- LABELING:** The label states the total amount of clonidine in the Transdermal System and the release rate, in mg/day, for the duration of the application of one system. When more than one *Drug Release* test is given, the labeling states the *Drug Release* test used only if *Test 1* is not used.

### • USP REFERENCE STANDARDS <11>

USP Clonidine RS

USP Clonidine Related Compound B RS

2-[(E)-2,6-Dichlorophenylimino]-1-(1-{2-[(E)-2,6-dichlorophenylimino]-imidazolidin-1-yl}-ethyl)imidazolidine.

$C_{20}H_{20}Cl_4N_6$  486.23

## Clopidogrel Bisulfate

$C_{16}H_{16}ClNO_2S \cdot H_2SO_4$  419.90

Thieno[3,2-c]pyridine-5(4H)-acetic acid, α-(2-chlorophenyl)-6,7-dihydro-, methyl ester, (S)-, sulfate (1:1).

Methyl (+)-(S)-α-(o-chlorophenyl)-6,7-dihydrothieno[3,2-c]pyridine-5(4H)-acetate, sulfate (1:1) [120202-66-6].

» Clopidogrel Bisulfate contains not less than 97.0 percent and not more than 101.5 percent of  $C_{16}H_{16}ClNO_2S \cdot H_2SO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Clopidogrel Bisulfate RS

USP Clopidogrel Related Compound A RS

(+)-(S)-(o-Chlorophenyl)-6,7-dihydrothieno[3,2-c]pyridine-5(4H)-acetic acid.

USP Clopidogrel Related Compound B RS

Methyl (±)-(o-chlorophenyl)-4,5-dihydrothieno[2,3-c]pyridine-6(7H)-acetate, hydrochloride.

USP Clopidogrel Related Compound C RS

Methyl (–)-(R)-(o-chlorophenyl)-6,7-dihydrothieno[3,2-c]pyridine-5(4H)-acetate, hydrogen sulfate.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** It responds to the test for *Sulfate* (191).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Related compounds**—[NOTE—For all clopidogrel related compounds, the concentrations are expressed as bisulfate salts. Use bisulfate salt equivalents stated on USP Reference Standards labels to calculate the concentrations as appropriate.]

*Phosphate buffer*, *Mobile phase*, and *System suitability solution*—Proceed as directed in the *Assay*.

*Standard solution*—Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS, USP Clopidogrel Related Compound A RS, USP Clopidogrel Related Compound B RS, and USP Clopidogrel Related Compound C RS in methanol, and dilute with methanol to obtain a solution having known concentrations of about 20 µg per mL, 40 µg per mL, 120 µg per mL, and 200 µg per mL, respectively. Transfer 5 mL of this solution to a 200-mL volumetric flask, and dilute with *Mobile phase* to volume, and mix to obtain a solution having final concentrations of about 0.5 µg per mL, 1 µg per mL, 3 µg per mL, and 5 µg per mL, respectively.

*Test solution*—Transfer about 100 mg of Clopidogrel Bisulfate, accurately weighed, to a 200-mL volumetric flask, dissolve in 5 mL of methanol and dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and 4.6-mm × 15-cm column that contains packing L57. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for clopidogrel related compound A, 0.8 and 1.2 for the two enantiomers of clopidogrel related compound B, 1.0 for clopidogrel, and 2.0 for clopidogrel related compound C; and the resolution, *R*, between clopidogrel and the first enantiomer of clopidogrel related compound B is greater than 2.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 15% for each peak.

*Procedure*—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the percentage of clopidogrel related compound A and clopidogrel related compound C in the portion of Clopidogrel Bisulfate taken by the formula:

$$100(C_A / C_T)(r_U / r_S)$$

in which  $C_A$  is the concentration, in mg per mL, of the relevant clopidogrel related compound in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Clopidogrel Bisul-

fate in the *Test solution*;  $r_U$  is the peak response for the relevant clopidogrel related compound obtained from the *Test solution*; and  $r_S$  is the peak response for the relevant clopidogrel related compound obtained from the *Standard solution*.

Calculate the percentage of the first enantiomer of clopidogrel related compound B in the portion of Clopidogrel Bisulfate taken by the formula:

$$100 \times 0.5(C_B / C_T)(r_U / r_S)$$

in which  $C_B$  is the concentration, in mg per mL, of clopidogrel related compound B in the *Standard solution*; 0.5 is the correction for the content of the first enantiomer in clopidogrel related compound B;  $r_U$  and  $r_S$  are the peak responses of the first enantiomer of clopidogrel related compound B in the *Test solution* and *Standard solution*, respectively; and the other terms are as defined above.

Calculate the percentage of any impurity other than clopidogrel related compounds A, B, and C in the portion of Clopidogrel Bisulfate taken by the formula:

$$100(C / C_T)(r_U / r_S)$$

in which  $C$  is the concentration of clopidogrel bisulfate, in mg per mL, in the *Standard solution*;  $r_U$  is the peak response of any other impurity obtained from the *Test solution*;  $r_S$  is the peak response of the clopidogrel peak obtained from the *Standard solution*; and the other terms are as defined above: not more than 0.2% of clopidogrel related compound A is found; not more than 0.3% of the first enantiomer of clopidogrel related compound B is found; not more than 1.0% of clopidogrel related compound C is found; not more than 0.1% of any other impurity is found; and not more than 1.5% of total impurities is found. Disregard any peak observed in the blank.

**Assay**—[NOTE—For all clopidogrel related compounds, the concentrations are expressed as bisulfate salts. Use bisulfate salt equivalents stated on USP Reference Standards labels to calculate the concentrations as appropriate.]

*Phosphate buffer*—Dissolve 1.36 g of monobasic potassium phosphate in about 500 mL of water, and dilute with water to 1000 mL.

*Mobile phase*—Prepare a filtered and degassed mixture of *Phosphate buffer* and acetonitrile (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Clopidogrel Bisulfate RS in methanol to obtain a solution having a known concentration of about 1.0 mg of clopidogrel bisulfate per mL. Dilute a suitable portion of this solution, accurately measured, with *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL.

*System suitability solution*—Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS and USP Clopidogrel Related Compound B RS in methanol, and quantitatively dilute with methanol to obtain a solution having concentrations of about 100 µg per mL and 200 µg per mL, respectively. Transfer 5 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Transfer about 100 mg of Clopidogrel Bisulfate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix. Pipet 5.0 mL of this solution to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L57. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are

about 0.8 and 1.2 for enantiomers of clopidogrel related compound B, respectively, and 1.0 for clopidogrel; and the resolution,  $R$ , between clopidogrel and the first enantiomer of clopidogrel related compound B is greater than 2.5. Chromatograph the *Standard preparation*: the relative standard deviation for replicate injections determined from clopidogrel bisulfate is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Calculate the quantity, in mg, of  $C_{16}H_{16}ClNO_2S \cdot H_2SO_4$  in the portion of Clopidogrel Bisulfate taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Clopidogrel Bisulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clopidogrel Tablets

» Clopidogrel Tablets contain Clopidogrel Bisulfate equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clopidogrel ( $C_{16}H_{16}ClNO_2S$ ).

**Packaging and storage**—Preserve in well-closed containers, and store at controlled room temperature.

### USP Reference standards (11)—

USP Clopidogrel Bisulfate RS

USP Clopidogrel Related Compound A RS

(+)-(S)-(o-Chlorophenyl)-6,7-dihydrothieno[3,2-c]pyridine-5(4H)-acetic acid.

USP Clopidogrel Related Compound B RS

Methyl ( $\pm$ )-(o-chlorophenyl)-4,5-dihydrothieno[2,3-c]pyridine-6(7H)-acetate, hydrochloride.

USP Clopidogrel Related Compound C RS

Methyl (–)-(R)-(o-chlorophenyl)-6,7-dihydrothieno[3,2-c]pyridine-5(4H)-acetate, hydrogen sulfate.

### Identification—

**A:** Ultraviolet Absorption (197U)—

*Spectral range:* 250 to 300 nm.

*Solution*—Use the test solution prepared as directed in the test for *Uniformity of dosage units*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* pH 2.0 hydrochloric acid buffer (see *Buffer Solutions* under *Reagents, Indicators, and Solutions*); 1000 mL.

*Apparatus 2:* 50 rpm.

*Time:* 30 minutes.

*Standard solution*—Dissolve an accurately weighed quantity of USP Clopidogrel Bisulfate RS in 20.0 mL of methanol, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a known concentration corresponding to that of the solution under test.

*Procedure*—Determine the amount of  $C_{16}H_{16}ClNO_2S$  dissolved by employing UV absorption at a wavelength of about 240 nm on filtered portions of the solution under test in comparison with the *Standard solution*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{16}H_{16}ClNO_2S$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Using a suitable volumetric flask, place 1 Tablet in 50.0 mL of 0.1 N hydrochloric acid. Sonicate for 5 minutes, and cool. Quantitatively transfer 5.0 mL of this solution to the flask, and dilute with 0.1 N hydrochloric acid to 50.0 mL. Pass a portion of the solution through a suitable filter having a 0.45- $\mu$ m or finer porosity, discarding the first 5 mL of the filtrate. Determine the amount of clopidogrel by employing UV absorption at the wavelength of maximum absorbance at about 270 nm, in comparison with a *Standard solution* having a known concentration of USP Clopidogrel Bisulfate RS in 0.1 N hydrochloric acid.

**Related compounds**—[NOTE—For all clopidogrel related compounds, the concentrations are expressed as bisulfate salts. Use bisulfate salt equivalents stated on USP Reference Standards labels to calculate the concentrations as appropriate.]

*Phosphate buffer and Mobile phase*—Prepare as directed in the *Assay under Clopidogrel Bisulfate*.

*System suitability solution*—Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS and USP Clopidogrel Related Compound B RS in methanol, and dilute with methanol to obtain a solution having concentrations of about 100  $\mu$ g per mL and 200  $\mu$ g per mL, respectively. Transfer 5 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Standard solution*—Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS, USP Clopidogrel Related Compound A RS, and USP Clopidogrel Related Compound C RS in methanol to obtain a solution having known concentrations of about 40  $\mu$ g per mL, 250  $\mu$ g per mL, and 300  $\mu$ g per mL, respectively. Transfer 5 mL of this solution to a 200-mL volumetric flask, and dilute with *Mobile phase* to volume. This solution contains about 1  $\mu$ g of clopidogrel bisulfate per mL, 6  $\mu$ g of clopidogrel related compound A per mL, and 7.5  $\mu$ g of clopidogrel related compound C per mL.

*Test solution*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of clopidogrel (free base), to a 200-mL volumetric flask, add 5 mL of methanol, dilute with *Mobile phase* to volume, and mix. Allow to stand for 10 minutes, and mix. Pass a portion of this solution through a filter having a 0.45- $\mu$ m or finer porosity, and use the filtrate after discarding the first 5 mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and 4.6-mm  $\times$  15-cm column that contains packing L57. The flow rate is about 1.0 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.8 and 1.2 for the two enantiomers of clopidogrel related compound B and 1.0 for clopidogrel; and the resolution,  $R$ , between clopidogrel and the first enantiomer of clopidogrel related compound B is greater than 2.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for clopidogrel related compound A, 1.0 for clopidogrel and 2.0 for clopidogrel related compound C; and the relative standard deviation for replicate injections is not more than 15% for each peak.

*Procedure*—Inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of clopidogrel related

compounds A and C in the portion of Tablets taken by the formula:

$$20(321.82/419.90)(C/W)(r_U / r_S)$$

in which 321.82 is the molecular weight of clopidogrel; 419.90 is the molecular weight of clopidogrel bisulfate; C is the concentration, in  $\mu\text{g}$  per mL, of the relevant clopidogrel related compound in the *Standard solution*; W is the weight, in mg, of clopidogrel in the portion of Tablets used to prepare the *Test solution* based on the labeled quantity of clopidogrel per Tablet, Tablet weight, and the weight of the portion of Tablets used; and  $r_U$  and  $r_S$  are the peak responses of the corresponding related compounds obtained from the *Test solution* and the *Standard solution*, respectively.

Calculate the percentage of any other impurity (excluding clopidogrel related compound B) in the portion of Tablets taken by the formula:

$$20(321.82/419.90)(C_C / W)(r_U / r_S)$$

in which  $C_C$  is the concentration of clopidogrel bisulfate, in  $\mu\text{g}$  per mL, in the *Standard solution*;  $r_U$  is the peak response of any other impurity obtained from the *Test solution*;  $r_S$  is the peak response of clopidogrel peak obtained from the *Standard solution*; and the other terms are as defined above: not more than 1.2% of clopidogrel related compound A is found, not more than 1.5% of clopidogrel related compound C is found, not more than 0.2% of any other single impurity (excluding clopidogrel related compound B) is found, and not more than 2.5% of total impurities (excluding clopidogrel related compound B) is found.

**Assay**—[NOTE—For all clopidogrel related compounds, the concentrations are expressed as bisulfate salts. Use bisulfate salt equivalents stated on USP Reference Standards labels to calculate the concentrations as appropriate.]

*Phosphate buffer, Mobile phase, and Chromatographic system*—Proceed as directed in the Assay under Clopidogrel Bisulfate.

*System suitability preparation*—Dissolve accurately weighed quantities of USP Clopidogrel Bisulfate RS and USP Clopidogrel Related Compound B RS in methanol, and quantitatively dilute with methanol to obtain a solution having concentrations of about 100  $\mu\text{g}$  per mL and 200  $\mu\text{g}$  per mL, respectively. Transfer 5 mL of this solution to a 200-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Clopidogrel Bisulfate RS in methanol to obtain a solution having a known concentration of about 0.1 mg of clopidogrel bisulfate per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of clopidogrel (base), to a 100-mL volumetric flask, and add 50 mL of methanol. Sonicate for 5 minutes, and stir for 30 minutes. Dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to the flask, dilute with methanol to 50.0 mL, and mix. Pass a portion of this solution through a filter having a 0.45- $\mu\text{m}$  or finer porosity, and use the filtrate after discarding the first 5 mL.

*Procedure*—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the analyte peaks. Calculate the quantity, in mg, of clopidogrel ( $\text{C}_{16}\text{H}_{16}\text{ClNO}_2\text{S}$ ) in the portion of Tablets taken by the formula:

$$1000(321.82/419.90)C(r_U / r_S)$$

in which 321.82 is the molecular weight of clopidogrel; 419.90 is the molecular weight of clopidogrel bisulfate; C is the concentration, in mg per mL, of USP Clopidogrel Bisulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the

peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cloprostenol Sodium

$\text{C}_{22}\text{H}_{28}\text{ClNaO}_6$  446.90

5-Heptenoic acid, 7-[2-[4-(3-chlorophenoxy)-3-hydroxy-1-butenyl]-3,5-dihydroxycyclopentyl]-, [1 $\alpha$ (Z),2 $\beta$ (1E,3R\*),3 $\alpha$ ,5 $\alpha$ ]-, sodium salt, ( $\pm$ )-. ( $\pm$ )-Sodium (Z)-7-[(1R\*,2R\*,3R\*,5S\*)-2-[(E)-(3R\*)-4-(m-chlorophenoxy)-3-hydroxy-1-butenyl]-3,5-dihydroxycyclopentyl]-5-heptenoate [55028-72-3].

» Cloprostenol Sodium contains not less than 97.5 percent and not more than 102.5 percent of  $\text{C}_{22}\text{H}_{28}\text{ClNaO}_6$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Cloprostenol Sodium RS

**Identification**—

A: Infrared Absorption (197K).

B: It meets the requirements of the test for Sodium (191).

**Water, Method I** (921)—Use 50 mg dissolved in 1 mL of dehydrated alcohol: not more than 3.0%.

**Chromatographic purity**—

*Mobile phase*—Prepare a filtered and degassed mixture of the chromatographic solvent hexane, dehydrated alcohol, and glacial acetic acid (930:70:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Test solution*—Dissolve an accurately weighed quantity of Cloprostenol Sodium in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of about 20 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—Prepare as directed in the Assay.

*Procedure*—Inject a volume (about 5  $\mu\text{L}$ ) of the *Test solution* into the chromatograph. Record the chromatogram for a total time of not less than twice the retention time of the peak due to cloprostenol, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Cloprostenol Sodium taken by the formula:

$$100(r_i / r_S)$$

in which  $r_i$  is the peak response for each impurity, and  $r_S$  is the sum of the responses of all of the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.5% of total impurities is found. Disregard any peak below 0.05%.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of the chromatographic solvent hexane, dehydrated alcohol, and glacial acetic acid (900:100:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cloprostenol Sodium RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of about 0.8 mg per mL.

**Assay preparation**—Using a suitable quantity of Cloprostenol Sodium, accurately weighed, proceed as directed in the *Standard preparation*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L3. The flow rate is about 1.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5 for the cloprostenol peak; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of  $C_{22}H_{28}ClNaO_6$  in the portion of Cloprostenol Sodium taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Cloprostenol RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of Cloprostenol Sodium in the *Assay preparation*; and  $r_U$  and  $r_S$  are the cloprostenol peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cloprostenol Injection

» Cloprostenol Injection is a sterile solution of Cloprostenol Sodium in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cloprostenol ( $C_{22}H_{29}ClO_6$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers protected from light. Store at controlled room temperature.

**Labeling**—Label it to indicate that it is for veterinary use only, and to indicate the strength as the equivalent amount of cloprostenol per dose.

**USP Reference standards** <11>—

USP Cloprostenol Sodium RS

USP Endotoxin RS

USP Hydrocortisone Acetate RS

**Identification**—

**A:** The retention time of the cloprostenol peak in the chromatogram of the *Assay preparation* corresponds to that of the cloprostenol peak in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**B:** It meets the requirements of the test for *Sodium* <191>.

**Bacterial endotoxins** <85>—It contains not more than 2500 USP Endotoxin Units per mg of cloprostenol.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Related compounds**—

**Mobile phase and System suitability solution**—Prepare as directed in the *Assay*.

**Standard solution**—Prepare as directed for *Standard preparation* under *Assay*.

**Test solution**—Prepare as directed for *Assay preparation*.

**Chromatographic system** (see *Chromatography* <621>)—Prepare as directed in the *Assay*.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure all of the peak responses. Calculate the percentage of each impurity in the portion of Injection taken by the formula:

$$100(C_S / C_T)(r_i / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Cloprostenol Sodium RS in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of cloprostenol in the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_S$  is the peak response of cloprostenol obtained from the *Standard solution*: not more than 1.0% of any individual impurity is found, and not more than 2.5% of total impurities is found. Disregard any peak below 0.05%.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

**pH 2.5 Monobasic sodium phosphate solution**—Prepare an aqueous solution containing 2.4 mg of monobasic sodium phosphate dihydrate per mL of solution. Adjust with phosphoric acid to a pH of 2.5.

**Mobile phase**—Prepare a filtered and degassed mixture of pH 2.5 Monobasic sodium phosphate solution and acetonitrile (73:27). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**System suitability solution**—Dissolve an accurately weighed quantity of USP Cloprostenol Sodium RS and USP Hydrocortisone Acetate RS in dehydrated alcohol, and dilute with *Mobile phase* to obtain a solution containing about 0.25 mg of cloprostenol sodium and 0.5 mg of hydrocortisone acetate per mL of solution.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cloprostenol Sodium RS in dehydrated alcohol, and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Dilute a volume of Injection in dehydrated alcohol and dilute quantitatively, and stepwise if necessary, with dehydrated alcohol to obtain a solution containing 0.1 mg of cloprostenol per mL of solution, based on the label claim.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 5-mm × 25-cm column that contains packing L1. The flow rate is about 1.8 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the hydrocortisone acetate peak and the cloprostenol peak is not less than 6. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the cloprostenol peak. Calculate the percentage label claim of cloprostenol ( $C_{22}H_{29}ClO_6$ ) in the portion of Injection taken by the formula:

$$100(C_S / C_U)(r_U / r_S)(M_1 / M_2)$$

in which  $C_S$  is the concentration, in mg per mL, of USP Cloprostenol Sodium RS in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of cloprostenol in the

*Assay preparation*;  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively,  $M_1$  is the molecular weight of cloprostenol (424.92), and  $M_2$  is the molecular weight of cloprostenol sodium (446.90).

## Clorazepate Dipotassium

$C_{16}H_{11}ClK_2N_2O_4$  408.92

1*H*-1,4-Benzodiazepine-3-carboxylic acid, 7-chloro-2,3-dihydro-2-oxo-5-phenyl-, potassium salt compound with potassium hydroxide (1:1).

Potassium 7-chloro-2,3-dihydro-2-oxo-5-phenyl-1*H*-1,4-benzodiazepine-3-carboxylate compound with potassium hydroxide (1:1) [57109-90-7].

» Clorazepate Dipotassium contains not less than 98.5 percent and not more than 101.5 percent of  $C_{16}H_{11}ClK_2N_2O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve under nitrogen in tight, light-resistant containers.

**USP Reference standards** (11)—

USP 2-Amino-5-chlorobenzophenone RS

$C_{13}H_9ClNO$  231.68

USP Nordazepam RS

7-Chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one.

$C_{15}H_{11}ClN_2O$  270.72

USP Clorazepate Dipotassium RS

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 7 µg per mL.

*Medium:* sodium hydroxide solution (1 in 2500).

**Loss on drying** (731)—Dry it in vacuum at 60° for 1 hour; it loses not more than 0.5% of its weight.

**Heavy metals, Method II** (231): 0.002%.

**Related compounds**—

TEST 1—

*Phosphate buffer solution*—Dissolve about 13.8 g of monobasic sodium phosphate in 500 mL of water, adjust with 2.5 N sodium hydroxide to a pH of 8.0, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and *Phosphate buffer solution* (5:4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Dissolve about 5 mL of 2,6-dimethylaniline in 50 mL of hexane, and carefully add dropwise hydrochloric acid to precipitate the amine hydrochloride. Filter through a sintered-glass funnel, wash the solid precipitate with hexane, and allow the precipitate to dry. Transfer about 50 mg of the dried precipitate of 2,6-dimethylaniline hydrochloride to a 100-mL volumetric flask, add 10.0 mL of *Phosphate buffer solution* and 40 mL of water, and dilute with acetonitrile to volume.

*Standard solution*—Dissolve an accurately weighed quantity of USP Nordazepam RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to ob-

tain a solution having a known concentration of about 75 µg per mL. Transfer 4.0 mL of this solution to a 50-mL conical flask, add 4.0 mL of 0.7 M potassium carbonate, 2.0 mL of *Internal standard solution*, and 15.0 mL of water. Insert a stopper, and mix.

*Test solution*—Transfer an accurately weighed quantity of about 50 mg of Clorazepate Dipotassium to a 50-mL conical flask. Add 4.0 mL of 0.7 M potassium carbonate, and start stirring the solution. Add 2 mL of *Internal standard solution* and 19.0 mL of water. Stop stirring about 5 minutes after the addition of the 0.7 M potassium carbonate solution. [NOTE—Prepare fresh immediately before each injection.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 232-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*; the relative retention time for 2,6-dimethylaniline is about 0.8 and 1.0 for nordazepam; the relative standard deviation of the peak area ratio of nordazepam to 2,6-dimethylaniline for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak areas. Calculate the percentage of nordazepam in the portion of Clorazepate Dipotassium taken by the formula:

$$2500(C/W) (R_i / R_s)$$

in which *C* is the concentration, in mg per mL, of USP Nordazepam RS in the *Standard solution*; *W* is the weight, in mg, of Clorazepate Dipotassium taken to prepare the *Test solution*;  $R_i$  is the peak area ratio of any impurity to 2,6-dimethylaniline obtained from the *Test solution*; and  $R_s$  is the peak area ratio of nordazepam to 2,6-dimethylaniline obtained from the *Standard solution*: not more than 0.5% of nordazepam is found and not more than 0.1% of any individual impurity is found.

TEST 2—

*Diluent*—Prepare a mixture of 0.001 N sodium hydroxide and acetonitrile (1:1).

*Mobile phase*—Prepare a filtered and degassed mixture of water, acetonitrile, and a 1 M solution of tetrabutylammonium hydroxide in methanol (110:90:1), adjust with phosphoric acid to a pH of 7.7, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard solution*—Dissolve an accurately weighed quantity of USP 2-Amino-5-chlorobenzophenone RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent*, to obtain a solution having a known concentration of about 0.0026 mg per mL.

*Test solution*—Transfer about 300 mg of Clorazepate Dipotassium, accurately weighed, to a glass test tube. Add 10.0 mL of *Diluent*, and vigorously mix on a vortex mixer for about 90 seconds. [NOTE—Prepare fresh immediately before each injection.]

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 238-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*; the relative standard deviation of the peak height for replicate injections is not more than 3.0%.

*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each impurity

in the portion of Clorazepate Dipotassium taken by the formula:

$$1000(C/W)(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP 2-Amino-5-chlorobenzophenone RS in the *Standard solution*; W is the weight, in mg, of sample taken;  $r_i$  is the peak height of each impurity obtained from the *Test solution*; and  $r_s$  is the peak height of 2-amino-5-chlorobenzophenone obtained from the *Standard solution*: not more than 0.1% of 2-amino-5-chlorobenzophenone is found, not more than 0.1% of any other individual impurity is found, and not more than 1.0% of total impurities in *Test 1* and *Test 2* is found.

**Assay**—Transfer about 150 mg of Clorazepate Dipotassium, accurately weighed, to a 250-mL beaker, add 100 mL of glacial acetic acid, and stir until dissolved. Titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a glass electrode and a calomel electrode containing a 1 in 100 solution of lithium perchlorate in glacial acetic acid. Perform a blank determination (see *Titrimetry* (541)), and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 13.63 mg of  $C_{16}H_{11}ClK_2N_2O_4$ .

## Clorazepate Dipotassium Tablets

» Clorazepate Dipotassium Tablets contain not less than 90.0 percent and not more than 110.0 percent of clorazepate dipotassium ( $C_{16}H_{11}ClK_2N_2O_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP 2-Amino-5-chlorobenzophenone RS

$C_{13}H_{10}ClNO$  231.68

USP Nordazepam RS

7-Chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one.

$C_{15}H_{11}ClN_2O$  270.72

USP Clorazepate Dipotassium RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium*: 0.01 N hydrochloric acid; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{11}ClK_2N_2O_4$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 240 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Clorazepate Dipotassium RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{16}H_{11}ClK_2N_2O_4$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### PROCEDURE FOR CONTENT UNIFORMITY—

**Standard solution**—Dissolve an accurately weighed quantity of USP Clorazepate Dipotassium RS in 0.01 M sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with 0.01 M sodium hydroxide to obtain a solution having a known concentration of about 7.6 µg per mL.

**Test solution**—Transfer 1 Tablet to a suitable container, add 200 mL of 0.01 M sodium hydroxide, and homogenize for not less than 3 minutes. Centrifuge a portion of this solution for 15 minutes, and filter the supernatant, discarding the first 20 mL. Dilute an accurately measured portion of the filtrate with 0.01 M sodium hydroxide to obtain a solution having a known concentration of about 7.6 µg per mL.

**Procedure**—Concomitantly determine the absorbances of the *Standard solution* and the *Test solution* in 1-cm cells at the wavelength of maximum absorbance at about 231 nm, with a suitable spectrophotometer, using 0.01 M sodium hydroxide as the blank.

### Related compounds—

#### METHOD I—

**Phosphate buffer solution**—Dissolve about 13.8 g of monobasic sodium phosphate in 500 mL of water, adjust with 1 N sodium hydroxide to a pH of 8.0, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and *Phosphate buffer solution* (5:4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Nordazepam RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with acetonitrile to obtain a solution having a known concentration of about 66 µg per mL. Transfer 4.0 mL of this solution to a 25-mL volumetric flask, add 5.0 mL of 0.7 M potassium carbonate and 3.0 mL of acetonitrile, dilute with water to volume, mix, and filter.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 15 mg of clorazepate dipotassium, to a suitable container. Add 5 mL of acetonitrile, 5 mL of 0.7 M potassium carbonate, and 15 mL of water, stir for 10 minutes, and filter. [NOTE—Prepare fresh before each injection, and use within 3 minutes.]

**Chromatographic system**—The liquid chromatograph is equipped with a 232-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms for not less than twice the retention time of nordazepam, and measure the peak responses. Calculate the quantity, in mg, of each impurity in the portion of Tablets taken by the formula:

$$25C(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP Nordazepam RS in the *Standard solution*;  $r_i$  is the peak response of each impurity obtained from the *Test solution*; and  $r_s$  is the peak response for nordazepam obtained from the *Standard solution*: not more than 2.0% of nordazepam is found.

#### METHOD II—

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and a 1 M solution of tetrabutylammonium hydroxide in methanol (110:90:1), adjust with phosphoric acid to a pH of 7.7, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP 2-Amino-5-chlorobenzophenone RS in acetonitrile to obtain a solution having a known concentration of about 0.50 mg per mL. Dilute with water to obtain a solution having a known concentration of about 0.25 mg per mL. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with a mixture of 0.1 mM sodium hydroxide

and acetonitrile (7:3) to volume, and mix. Transfer 15 mL of this solution to a 50-mL volumetric flask, dilute with a mixture of 0.1 mM sodium hydroxide and acetonitrile (7:3) to volume, and mix.

**Test solution**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 15 mg of clorazepate dipotassium, to a suitable container, add 10 mL of a mixture of 0.1 mM sodium hydroxide and acetonitrile (7:3), mix, shake by mechanical means for 10 minutes, and filter.

**Chromatographic system**—The liquid chromatograph is equipped with a 238-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the quantity, in mg, of each impurity in the portion of Tablets taken by the formula:

$$10C(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP 2-Amino-5-chlorobenzophenone RS in the *Standard solution*;  $r_i$  is the peak response of each impurity obtained from the *Test solution*; and  $r_s$  is the response of the 2-amino-5-chlorobenzophenone peak obtained from the *Standard solution*: the sum of all impurities, other than nordazepam, found in *Method I* and *Method II* is not more than 0.5%.

#### Assay—

**Buffer solution**—Transfer 5.0 mL of 1 M tetrabutylammonium hydroxide in methanol to a 1-L volumetric flask, dilute with water to volume, adjust with phosphoric acid to a pH of 7.5, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Clorazepate Dipotassium RS in 0.01 M sodium hydroxide, and dilute quantitatively, and stepwise if necessary, with 0.01 M sodium hydroxide to obtain a solution having a known concentration of about 60 µg per mL. Shake by mechanical means for 15 minutes, and filter.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 75 mg of clorazepate dipotassium, to a suitable container, add 200 mL of 0.01 M sodium hydroxide, and homogenize for not less than 3 minutes. Transfer 15 mL of this solution to a 100-mL volumetric flask, dilute with 0.01 M sodium hydroxide to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 230-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses of the major peaks. Calculate the quantity, in mg, of clorazepate dipotassium ( $C_{16}H_{11}ClK_2N_2O_4$ ) in the portion of Tablets taken by the formula:

$$1333C(r_u / r_s)$$

in which C is the concentration, in mg per mL, of USP Clorazepate Dipotassium RS in the *Standard preparation*; and

$r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clorsulon

$C_8H_8Cl_3N_3O_4S_2$  380.66  
1,3-Benzenedisulfonamide, 4-amino-6-(trichloroethenyl)-  
4-Amino-6-(trichlorovinyl)-*m*-benzenedisulfonamide  
[60200-06-8].

» Clorsulon contains not less than 98.0 percent and not more than 101.0 percent of  $C_8H_8Cl_3N_3O_4S_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** <11>—  
USP Clorsulon RS

#### Identification—

**A:** *Infrared Absorption* <197M>.

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for clorsulon, the retention time of which corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

**Melting range** <741>: between 197° and 203°.

**Loss on drying** <731>—Dry it in vacuum at 100° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals, Method II** <231>: 0.003%.

**Chromatographic purity**—[NOTE—The *Standard solutions* and *Test solutions* should be stored in low-actinic glassware.] Prepare a solution of Clorsulon in methanol containing 10.0 mg per mL (*Test solution*). Prepare a solution of USP Clorsulon RS in methanol containing 10.0 mg per mL (*Standard solution A*). Transfer 1.0 mL of *Standard solution A* to a 100-mL volumetric flask, dilute with methanol to volume, and mix (*Standard solution B*). Apply 10-µL portions of the *Test solution* and of *Standard solution A*, and 5- and 10-µL portions of *Standard solution B* to a suitable thin-layer chromatographic plate (see *Chromatography* <621>), coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatograms in a solvent system consisting of a mixture of chloroform and methanol (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow the solvent to evaporate, and examine the plate under short-wavelength UV light: the chromatograms show principal spots at about the same  $R_f$  value. Estimate the amounts of any additional spots observed in the chromatogram of the *Test solution* by comparing them with the spots in the two chromatograms obtained from *Standard solution B*, corresponding to 0.5% and 1.0% of impurity: no spot, other than the principal spot, in the chromatogram of the *Test solution* is larger or more intense than that of the principal spot in the chromatogram obtained from the 5-µL portion of *Standard solution B* (0.5%), and the sum of all such impurities is not more than 2.0%.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and glacial acetic acid (70:30:0.1). Make

adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Clorsulon RS in *Mobile phase* to obtain a solution having a known concentration of about 0.1 mg per mL. Store the solution in low-actinic glassware.

**Assay preparation**—Transfer about 50 mg of Clorsulon, accurately weighed, to a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of this solution to a second 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Store the solution in low-actinic glassware.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 7400 theoretical plates; the tailing factor is not more than 1.4; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 30 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>17</sub>ClN<sub>2</sub> in the portion of Clorsulon taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Clorsulon RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the clorsulon peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clotrimazole

C<sub>22</sub>H<sub>17</sub>ClN<sub>2</sub> 344.84  
1*H*-Imidazole, 1-[(2-chlorophenyl)diphenylmethyl]-;  
1-(*o*-Chloro- $\alpha,\alpha$ -diphenylbenzyl)imidazole [23593-75-1].

### DEFINITION

Clotrimazole contains NLT 98.0% and NMT 102.0% of C<sub>22</sub>H<sub>17</sub>ClN<sub>2</sub>, calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** <197M>
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

**Buffer:** 4.35 mg/mL of dibasic potassium phosphate  
**Mobile phase:** Acetonitrile and *Buffer* (3:1). Pass through a membrane filter having a 0.2-µm or finer pore size. The ratio of volumes may be changed to obtain the required resolution.

**Standard solution:** 0.5 mg/mL of USP Clotrimazole RS in methanol

**System suitability solution:** 0.1 mg/mL each of USP Clotrimazole RS and USP Clotrimazole Related Compound A RS in methanol

**Sample solution:** 0.5 mg/mL of Clotrimazole in methanol

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 25 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for clotrimazole and clotrimazole related compound A are 1.0 and 1.2, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between clotrimazole and clotrimazole related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>22</sub>H<sub>17</sub>ClN<sub>2</sub> in the portion of Clotrimazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of clotrimazole from the *Sample solution*

$r_S$  = peak response of clotrimazole from the *Standard solution*

$C_S$  = concentration of USP Clotrimazole RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Clotrimazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

#### Inorganic Impurities

- RESIDUE ON IGNITION** <281>: NMT 0.1%
- HEAVY METALS**, *Method II* <231>: NMT 10 ppm

#### Organic Impurities

##### PROCEDURE 1: LIMIT OF IMIDAZOLE

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Standard solution:** 500 µg/mL of USP Imidazole RS in chloroform

**Sample solution:** 100 mg/mL of Clotrimazole in chloroform

**Application volume:** 5 µL

**Developing solvent system:** Methanol and chloroform (3:2)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Proceed as directed for *Chromatography* <621>, *Thin-Layer Chromatography*. After air-drying the plate for 5 min, place it in a closed container with a dish containing 100 g of iodine in a shallow layer, and allow to remain for 60 min. Remove the plate from the container, and observe the chromatogram.

**Acceptance criteria:** Any brown spot from the *Sample solution* at an  $R_f$  value corresponding to the principal spot from the *Standard solution* is not greater in size or intensity than the principal spot from the *Standard solution*: NMT 0.5% of imidazole.

• **PROCEDURE 2: LIMIT OF CLOTRIMAZOLE RELATED COMPOUND A**

**Buffer, Mobile phase, System suitability solution, and Chromatographic system:** Proceed as directed in the Assay.

**Standard solution:** 50 µg/mL of USP Clotrimazole Related Compound A RS prepared by dissolving in methanol using about 75% of the final flask volume. Dilute with *Buffer* to volume.

**Sample solution:** Transfer 100 mg of Clotrimazole to a 10-mL volumetric flask, add 5 mL of methanol to dissolve, add 2.5 mL of *Buffer*, dilute with methanol to volume, and mix.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of clotrimazole related compound A in the portion of Clotrimazole taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of clotrimazole related compound A from the *Sample solution*

$r_S$  = peak response of clotrimazole related compound A from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.5%

**SPECIFIC TESTS**

- **LOSS ON DRYING (731):** Dry a sample at 105° for 2 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers.
- **USP REFERENCE STANDARDS (11)**
  - USP Clotrimazole RS
  - USP Clotrimazole Related Compound A RS (o-Chlorophenyl)diphenylmethanol.
  - $C_{19}H_{15}ClO$  294.78
  - USP Imidazole RS

## Clotrimazole Cream

**DEFINITION**

Clotrimazole Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ).

**IDENTIFICATION**

- The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

• **PROCEDURE**

**Buffer:** 4.35 mg/mL of dibasic potassium phosphate

**Mobile phase:** Acetonitrile and *Buffer* (3:1)

[NOTE—The ratio of volumes may be changed to obtain the required resolution.]

**Standard solution:** 0.5 mg/mL of USP Clotrimazole RS in methanol

**System suitability solution:** 0.1 mg/mL each of USP Clotrimazole RS and USP Clotrimazole Related Compound A RS in methanol

**Sample solution:** Transfer the equivalent of 25 mg of clotrimazole from the Cream to a 50-mL screw-capped centrifuge tube. Add 25.0 mL of methanol, and heat at 50° in a water bath for 5 min, with occasional shaking. Remove the tube from the bath, and shake vigorously for 5 min. Cool in a methanol-ice bath for 15 min, and promptly centrifuge. Transfer the supernatant to a 50-mL volumetric flask. Add 20.0 mL of methanol to the residue in the centrifuge tube, and repeat the ex-

traction starting with "heat at 50° in a water bath".

Transfer the supernatant to the volumetric flask containing the supernatant from the first extraction, dilute with methanol to volume, and mix.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 25 µL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for clotrimazole and clotrimazole related compound A are 1.0 and 1.2, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.0 between clotrimazole and clotrimazole related compound A, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{22}H_{17}ClN_2$  in the portion of Cream taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of clotrimazole from the *Sample solution*

$r_S$  = peak response of clotrimazole from the *Standard solution*

$C_S$  = concentration of USP Clotrimazole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clotrimazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers, at a temperature between 2° and 30°.
- **LABELING:** Cream that is packaged and labeled for use as a vaginal preparation shall be labeled Clotrimazole Vaginal Cream.
- **USP REFERENCE STANDARDS (11)**
  - USP Clotrimazole RS
  - USP Clotrimazole Related Compound A RS (o-Chlorophenyl)diphenylmethanol.
  - $C_{19}H_{15}ClO$  294.78

## Clotrimazole Lotion

**DEFINITION**

Clotrimazole Lotion contains NLT 90.0% and NMT 110.0% of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ).

**IDENTIFICATION**

- **A.** The retention time of the major peak for clotrimazole of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

**ASSAY**

• **PROCEDURE**

**Buffer:** 4.35 g/L of dibasic potassium phosphate in water

**Mobile phase:** Methanol and *Buffer* (3:1). Pass through a filter of 0.5-µm or finer pore size.

**Internal standard solution:** 0.07 mg/mL of testosterone propionate in dehydrated alcohol

**Standard stock solution A:** 2 mg/mL of USP Clotrimazole RS in dehydrated alcohol

**Standard stock solution B:** 0.1 mg/mL of USP Clotrimazole Related Compound A RS in dehydrated alcohol

**Standard solution:** *Standard stock solution A, Standard stock solution B, and Internal standard solution (5.0: 5.0: 10.0)*

**Sample solution:** Nominally 1 mg/mL, prepared as follows. Transfer the equivalent of 10 mg of clotrimazole from freshly mixed Lotion to a screw-capped, 50-mL centrifuge tube. Add 10.0 mL of *Internal standard solution*, place the cap on the tube, and heat at 50° in a water bath for 5 min, with occasional shaking. Remove the tube from the bath, and shake vigorously for 5 min. Cool in a methanol-ice bath for 15 min, and promptly centrifuge. Transfer the supernatant to a test tube. Add 10.0 mL of dehydrated alcohol to the residue in the centrifuge tube, and repeat the extraction as directed above, beginning with "place the cap on the tube". Transfer the supernatant to the test tube containing the supernatant from the first extraction.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

#### Columns

**Guard:** 2.1-mm × 6-cm, 10-μm packing L2

**Analytical:** 3.9-mm × 30-cm; 10-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for clotrimazole related compound A, clotrimazole, and testosterone propionate are 0.9, 1.0, and 1.5, respectively.]

#### Suitability requirements

**Resolution:** NLT 1.2 between clotrimazole related compound A and clotrimazole, and NLT 1.9 between clotrimazole and testosterone propionate

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ) in the portion of Lotion taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of clotrimazole to testosterone propionate from the *Sample solution*

$R_S$  = peak response ratio of clotrimazole to testosterone propionate from the *Standard solution*

$C_S$  = concentration of USP Clotrimazole RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clotrimazole in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### IMPURITIES

##### • ORGANIC IMPURITIES: LIMIT OF CLOTRIMAZOLE RELATED COMPOUND A

**Analysis:** Using the chromatograms of the *Standard solution* and *Sample solution* as obtained in the *Assay*, calculate the percentage of clotrimazole related compound A in the portion of Lotion taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of clotrimazole related compound A to testosterone propionate from the *Sample solution*

$R_S$  = peak response ratio of clotrimazole related compound A to testosterone propionate from the *Standard solution*

$C_S$  = concentration of USP Clotrimazole Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of clotrimazole related compound A in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 5%

#### SPECIFIC TESTS

• **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: It meets the requirements for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

• **PH** <791>: 5.0–7.0

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers, and store at a temperature between 2° and 30°.

• **USP REFERENCE STANDARDS** <11>

USP Clotrimazole RS

USP Clotrimazole Related Compound A RS

(*o*-Chlorophenyl)diphenylmethanol.

$C_{19}H_{15}ClO$  294.78

## Clotrimazole Lozenges

» Clotrimazole Lozenges contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ) in a suitable molded base.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—

USP Clotrimazole RS

#### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**B:** Place a quantity of finely powdered Lozenges, equivalent to about 50 mg of clotrimazole, into a screw-capped 50-mL test tube, add 20.0 mL of dichloromethane, and mix. Shake by mechanical means for 10 minutes, and allow the suspension to settle. Use the supernatant as the test solution. Separately apply 20 μL of this solution and 20 μL of a Standard solution of USP Clotrimazole RS in dichloromethane containing 2.5 mg per mL to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of diethyl ether and ammonium hydroxide (8:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Examine the plate under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution. Dissolve 3 g of bismuth subnitrate and 30 g of potassium iodide in 10 mL of dilute hydrochloric acid (1 in 4), dilute with water to 100 mL, mix, and prepare a spray reagent by diluting 10 mL of this solution and 10 mL of dilute hydrochloric acid (1 in 4) with water to 100 mL. Spray the plate with the spray reagent, and visually locate the clotrimazole spots on the plate: the spots are orange.

**Dissolution** <711>—

*Medium:* 0.1 N hydrochloric acid; 500 mL, deaerated.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

Determine the amount of  $C_{22}H_{17}ClN_2$  dissolved by employing the following method.

*25 mM Phosphate buffer*—Dissolve 4.4 g of dibasic potassium phosphate in 1000 mL of water.

*100 mM Phosphate buffer*—Dissolve 17.4 g of dibasic potassium phosphate in 1000 mL of water.

*Diluent*—Prepare a filtered and degassed mixture of methanol and *100 mM Phosphate buffer* (60:40).

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and *25 mM Phosphate buffer* (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard solution*—Dissolve an accurately weighed quantity of USP Clotrimazole RS, and dilute quantitatively, and stepwise if necessary, with *Medium* to obtain a solution having a concentration of about 0.02 mg per mL.

*Working standard solution*—Transfer 5.0 mL of the *Standard solution* to a 25-mL volumetric flask, dilute with *Diluent* to volume, and mix.

*Test solution*—Withdraw 25 mL of the solution under test from the vessel. Pass through a 0.45- $\mu$ m polyvinylidene difluoride filter, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of the filtrate to a 25-mL volumetric flask. Dilute with *Diluent* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 3.9-mm  $\times$  7.5-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Working standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Working standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in percentage, of  $C_{22}H_{17}ClN_2$  released by the formula:

$$\frac{r_U \times C_S \times 500 \times D \times 100}{r_S \times LC}$$

in which  $r_U$  and  $r_S$  are the peak responses for the *Test solution* and the *Working standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of the *Working standard solution*; 500 is the volume, in mL, of *Medium*;  $D$  is the dilution factor of the *Test solution*; 100 is the conversion factor to percentage; and  $LC$  is the label claim, in mg.

*Tolerances*—Not less than 80% ( $Q$ ) of the labeled amount of  $C_{22}H_{17}ClN_2$  is dissolved in 45 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

*Buffer solution*—Dissolve 1 g of ammonium carbonate in 1000 mL of water. Adjust with 10% sulfuric acid solution to a pH of 6.0.

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (75:25). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Internal standard stock solution*—Dissolve an accurately weighed quantity of triphenylmethane in methanol, and dilute quantitatively and stepwise with methanol to obtain a solution having a concentration of 5 mg per mL.

*Internal standard solution*—Pipet 10.0 mL of *Internal standard stock solution* into a 250-mL volumetric flask, and dilute with *Mobile phase* to volume.

*Standard preparation*—Transfer about 20 mg of USP Clotrimazole RS, accurately weighed, to a 100-mL volumetric flask. Add 4.0 mL of *Internal standard stock solution*, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Weigh and pulverize not fewer than 10 Lozenges. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of clotrimazole, to a 50-mL screw-capped centrifuge tube. Pipet 25 mL of *Internal standard solution* into the tube. Sonicate for 10 minutes, then shake for 10 minutes. Centrifuge at 2500 rpm for 30 minutes. Use the clear supernatant layer as the *Assay preparation*.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for clotrimazole and 1.4 for triphenylmethane; the resolution,  $R$ , between clotrimazole and triphenylmethane is not less than 1.5; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clotrimazole ( $C_{22}H_{17}ClN_2$ ) in the portion of Lozenges taken by the formula:

$$25C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Clotrimazole RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the ratios of the peak responses for clotrimazole to triphenylmethane obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Clotrimazole Topical Solution**

---

» Clotrimazole Topical Solution is a solution of Clotrimazole in a suitable nonaqueous, hydrophilic solvent. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ).

**Packaging and storage**—Preserve in tight containers, at a temperature between 2° and 30°.

**USP Reference standards** <11>—

USP Clotrimazole RS

USP Clotrimazole Related Compound A RS  
(*o*-Chlorophenyl)diphenylmethanol.

$C_{19}H_{15}ClO$  294.78

**Change to read:**

**Identification**—• In a suitable chromatographic chamber, arranged for thin-layer chromatography (see *Chromatography* <621>) and containing 200 mL of ether, place a beaker containing 25 mL of ammonium hydroxide. Cover the chamber, and allow to equilibrate for 2 hours. Transfer a volume of Topical Solution, equivalent to about 10 mg of clotrimazole, to a screw-capped, 50-mL centrifuge tube, and add 5 mL of dilute ammonium hydroxide (1 in 100) and

10 mL of chloroform. Shake vigorously, and centrifuge to obtain a clear chloroform phase. Apply 20  $\mu$ L of the lower chloroform phase and 20  $\mu$ L of a solution of USP Clotrimazole RS in chloroform containing 1 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  value of the principal spot from the *Test solution* corresponds to that obtained from the *Standard solution*. Dissolve 3 g of bismuth subnitrate and 30 g of potassium iodide in 10 mL of dilute hydrochloric acid (1 in 4), dilute with water to 100 mL, mix, and prepare a spray reagent by diluting 10 mL of this solution and 5 mL of dilute hydrochloric acid (1 in 4) with water to 200 mL, and mixing. Spray the plate evenly with this spray reagent: the principal spots from the *Test solution* and the *Standard solution* are orange. • (ERR 1-May-2012)

#### Assay—

**Buffer**—Prepare as directed in the Assay under *Clotrimazole*.

**Mobile phase**—Methanol and Buffer (3:1)

**Internal standard solution**—Transfer about 66 mg of testosterone propionate to a 100-mL volumetric flask, dissolve in 75 mL of methanol, dilute with *Dibasic potassium phosphate solution* to volume, and mix.

**Standard preparation**—Transfer about 50 mg of USP Clotrimazole RS to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Resolution solution**—Prepare a solution of USP Clotrimazole Related Compound A RS in methanol having a concentration of about 0.2 mg per mL. Transfer 12 mL of this solution to a 25-mL volumetric flask, add 4 mL of *Dibasic potassium phosphate solution* and 3 mL of *Standard preparation*, dilute with *Mobile phase* to volume, and mix.

**Assay preparation**—Transfer an accurately measured volume of Topical Solution, equivalent to about 50 mg of clotrimazole, to a 50-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 2.1-mm  $\times$  6-cm guard column that contains 10- $\mu$ m packing L7 and a 3.9-mm  $\times$  30-cm analytical column that contains 10- $\mu$ m packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.9 for clotrimazole related compound A and 1.0 for clotrimazole; and the resolution,  $R$ , between clotrimazole related compound A and clotrimazole is not less than 1.2. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for clotrimazole and 1.5 for testosterone propionate; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clotrimazole ( $C_{22}H_{17}ClN_2$ ) in each mL of Topical Solution taken by the formula:

$$50(C/V)(R_U/R_S)$$

in which C is the concentration, in mg per mL, of USP Clotrimazole RS in the *Standard preparation*; V is the volume, in mL, of Topical Solution taken; and  $R_U$  and  $R_S$  are the peak response ratios of clotrimazole to testosterone propionate

obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clotrimazole Vaginal Inserts

» Clotrimazole Vaginal Inserts contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ).

**Packaging and storage**—Preserve in well-closed containers.

#### USP Reference standards <11>—

**Disintegration** <701>: 20 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

#### Assay—

**Buffer**—Prepare as directed in the Assay under *Clotrimazole*.

**Mobile phase**—Methanol and Buffer (3:1)

**Internal standard solution**, **Standard preparation**, **Resolution solution**, and **Chromatographic system**—Prepare as directed in the Assay under *Clotrimazole Topical Solution*.

**Assay preparation**—Weigh and finely powder not fewer than 10 Vaginal Inserts. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of clotrimazole, to a 50-mL, screw-capped centrifuge tube, add 10.0 mL of *Internal standard solution* and 15 mL of *Mobile phase*, rotate for 15 minutes, and centrifuge for 10 minutes. Using a suitable syringe, transfer the supernatant to a 100-mL volumetric flask. Rinse the syringe with 25 mL of *Mobile phase*, adding the rinsings to the centrifuge tube.

Rotate the centrifuge tube for 15 minutes, and centrifuge for 10 minutes. Using a suitable syringe, transfer the supernatant to the 100-mL volumetric flask. Rinse the syringe with 25 mL of *Mobile phase*, and add the washings to the 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of clotrimazole ( $C_{22}H_{17}ClN_2$ ) in the portion of Vaginal Inserts taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Clotrimazole RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of clotrimazole to testosterone propionate obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Clotrimazole and Betamethasone Dipropionate Cream

### DEFINITION

Clotrimazole and Betamethasone Dipropionate Cream contains NLT 90.0% and NMT 110.0% of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ) and an amount of betamethasone dipropionate equivalent to NLT 90.0% and NMT 110.0% of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ), in a suitable cream base.

### IDENTIFICATION

- A.** The retention times of the major peaks for clotrimazole and betamethasone dipropionate of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay* for clotrimazole and betamethasone.

### ASSAY

#### PROCEDURE

**Buffer:** 6.6 g/L of dibasic ammonium phosphate in water

**Mobile phase:** Prepare a mixture of methanol and *Buffer* (7:3), and adjust with phosphoric acid to a pH of  $7.0 \pm 0.2$ . Pass through a membrane filter having a 0.45- $\mu$ m or finer pore size, and degas.

**Internal standard solution:** 0.15 mg/mL of progesterone in alcohol

**Clotrimazole stock solution:** 5 mg/mL of USP Clotrimazole RS in alcohol

**Betamethasone dipropionate stock solution:** 6.4/ mg/mL of USP Betamethasone Dipropionate RS in alcohol,  $I$  being the ratio (in mg/g) of betamethasone to clotrimazole in the Cream

**Clotrimazole related compound A stock solution:** 0.5 mg/mL of USP Clotrimazole Related Compound A RS in methanol

**Standard solution:** Transfer 1.0 mL of *Clotrimazole related compound A stock solution* to a suitable container, and evaporate to dryness in a water bath at room temperature under a stream of nitrogen. To the residue add 2.0 mL each of *Clotrimazole stock solution*, *Betamethasone dipropionate stock solution*, and *Internal standard solution*.

**Sample solution:** Weigh a portion of Cream equivalent to 10 mg of clotrimazole, and transfer to a screw-capped, 50-mL centrifuge tube. Add 2.0 mL of *Internal standard solution* and 4.0 mL of alcohol, place the cap on the tube, and heat at  $60^\circ$  in a water bath for 10 min, with occasional shaking. Remove the tube from the bath, cool in an ice bath for 20 min, and promptly

centrifuge. Transfer a portion of the supernatant to a test tube, and use as the *Sample solution*.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm  $\times$  25-cm; 10- $\mu$ m packing L1

**Flow rate:** 1.7 mL/min

**Injection volume:** 20  $\mu$ L

### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for betamethasone dipropionate, clotrimazole related compound A, progesterone, and clotrimazole are about 1.0, 1.2, 1.4, and 1.7, respectively.]

### Suitability requirements

**Resolution:** NLT 1.0 between betamethasone dipropionate and clotrimazole related compound A, NLT 1.5 between clotrimazole related compound A and progesterone, and NLT 1.8 between progesterone and clotrimazole

**Relative standard deviation:** NMT 2.0% determined from clotrimazole and betamethasone dipropionate and NMT 4.0% determined from clotrimazole related compound A

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ) in the portion of Cream taken:

$$\text{Result} = (R_U / R_S) \times (C_S / C_U) \times 100$$

$R_U$  = peak response ratio of clotrimazole to progesterone from the *Sample solution*

$R_S$  = peak response ratio of clotrimazole to progesterone from the *Standard solution*

$C_S$  = concentration of USP Clotrimazole RS in the *Clotrimazole stock solution* (mg/mL)

$C_U$  = nominal concentration of clotrimazole in the *Sample solution* (mg/mL)

Calculate the percentage of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ ) in the portion of Cream taken:

$$\text{Result} = (R_U / R_S) \times (C_S / C_U) \times (M_{r1} / M_{r2}) \times 100$$

$R_U$  = peak response ratio of betamethasone dipropionate to progesterone from the *Sample solution*

$R_S$  = peak response ratio of betamethasone dipropionate to progesterone from the *Standard solution*

$C_S$  = concentration of USP Betamethasone Dipropionate RS in the *Betamethasone dipropionate stock solution* (mg/mL)

$C_U$  = nominal concentration of betamethasone in the *Sample solution* (mg/mL)

$M_{r1}$  = molecular weight of betamethasone, 392.46

$M_{r2}$  = molecular weight of betamethasone dipropionate, 504.60

**Acceptance criteria:** 90.0%–110.0% of the labeled amount of clotrimazole ( $C_{22}H_{17}ClN_2$ ); 90.0%–110.0% of the labeled amount of betamethasone ( $C_{22}H_{29}FO_5$ )

### IMPURITIES

#### ORGANIC IMPURITIES: LIMIT OF CLOTRIMAZOLE RELATED COMPOUND A

**Buffer, Mobile phase, Internal standard solution, Clotrimazole stock solution, Betamethasone dipropionate stock solution, Clotrimazole related compound A stock solution, Standard solution, Sample solution, Chromatographic system, and System suitability:** Use as directed in the *Assay*.

**Analysis:** Using the chromatograms of the *Standard solution* and *Sample solution* as obtained in the *Assay*, calcu-

late the percentage of clotrimazole related compound A in the portion of Cream taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

- $R_U$  = peak response ratio of clotrimazole related compound A to progesterone from the *Sample solution*  
 $R_S$  = peak response ratio of clotrimazole related compound A to progesterone from the *Standard solution*  
 $C_S$  = concentration of USP Clotrimazole Related Compound A RS in the *Clotrimazole related compound A stock solution* (mg/mL)  
 $C_U$  = nominal concentration of clotrimazole in the *Sample solution* (mg/mL)  
**Acceptance criteria:** NMT 5.0%

## PERFORMANCE TESTS

- **MINIMUM FILL** (755): Meets the requirements

## SPECIFIC TESTS

- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in collapsible tubes or tight containers.
- **USP REFERENCE STANDARDS** (11)
  - USP Betamethasone Dipropionate RS
  - USP Clotrimazole RS
  - USP Clotrimazole Related Compound A RS
  - (*o*-Chlorophenyl)diphenylmethanol.
  - $C_{19}H_{15}ClO$  294.78

## Cloxacillin Benzathine

$(C_{19}H_{18}ClN_3O_5S)_2 \cdot C_{16}H_{20}N_2$  1112.11

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[[3-(2-chlorophenyl)-5-methyl-4-isoxazolyl]carbonyl]-amino]-3,3-dimethyl-7-oxo-, [2*S*-(2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ )]-, compd. with *N,N'*-bis(phenylmethyl)-1,2-ethanediamine (2:1). (2*S*,5*R*,6*R*)-6-[3-(*o*-Chlorophenyl)-5-methyl-4-isoxazolecarboxamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid compound with *N,N'*-dibenzylethylenediamine (2:1) [23736-58-5].

» Cloxacillin Benzathine has a potency equivalent to not less than 704  $\mu$ g and not more than 821  $\mu$ g of cloxacillin ( $C_{19}H_{18}ClN_3O_5S$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only. Where it is intended for use in preparing sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of sterile dosage forms.

**USP Reference standards** (11)—

USP Cloxacillin Benzathine RS  
 USP Cloxacillin Sodium RS

## Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

**Solutions:** Obtain the test solution as follows. To about 20 mg in a 50-mL conical flask, add 5 mL of 5 N sodium hydroxide, and heat on a steam bath for 20 minutes. Cool, transfer 1 mL of this solution to a separator containing 10 mL of 1.2 N sulfuric acid, and extract with 50 mL of ether. Wash the ether extract with 30 mL of water, and extract the ether layer with 50 mL of 0.1 N sodium hydroxide. Similarly prepare the Standard solution from about 15 mg of USP Cloxacillin Sodium RS.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 3.0 and 6.5, in a suspension containing 10 mg per mL.

**Sterility** (71)—Where the label states that Cloxacillin Benzathine is sterile, it meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, to use Soybean-Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, and to shake the tubes once daily.

**Water, Method I** (921): not more than 5.0%.

## Assay—

**0.1 M Phosphate buffer**—Dissolve 55.2 g of monobasic sodium phosphate in water, and dilute with water to 4 L.

**Mobile phase**—Combine 1000 mL of acetonitrile and 3000 mL of 0.1 M Phosphate buffer. Adjust with phosphoric acid or 1 N sodium hydroxide to a pH of  $4.6 \pm 0.2$ . Pass through a 0.45- $\mu$ m nylon filter, and degas. [NOTE—The retention time of cloxacillin is very sensitive to the acetonitrile content of the *Mobile phase*.]

**Diluent**—Transfer 13.8 g of monobasic sodium phosphate to a 2-L volumetric flask, mix, and dilute with water to volume. Combine 1800 mL of the resulting solution with 1200 mL of acetonitrile. Adjust with phosphoric acid or 1 N sodium hydroxide to a pH of 6.4.

**Standard preparations**—In duplicate, dissolve an accurately weighed quantity of USP Cloxacillin Sodium RS in *Diluent* to obtain solutions having known concentrations of about 112  $\mu$ g per mL.

**Assay preparations**—In duplicate, dissolve an accurately weighed quantity of Cloxacillin Benzathine in *Diluent* to obtain solutions having concentrations of about 128  $\mu$ g per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  25-cm column that contains 10- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute and the column temperature is 40°. Chromatograph the *Standard preparations*, and record the peak areas as directed for *Procedure*: the tailing factor is less than 2.0; the peak areas of the two *Standard preparations* agree within 98% to 102%; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparations* and the *Assay preparations* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in  $\mu$ g, of  $C_{19}H_{18}ClN_3O_5S$  in each mg of Cloxacillin Benzathine taken by the formula:

$$P(C_S / C_U)(r_U / r_S)$$

in which *P* is the assigned potency, in  $\mu$ g of cloxacillin per mg, of USP Cloxacillin Sodium RS;  $C_S$  and  $C_U$  are the concentrations, in  $\mu$ g per mL, of cloxacillin sodium and cloxacil-

lin benzathine in the *Standard preparations* and the *Assay preparations*, respectively; and  $r_U$  and  $r_S$  are the average peak areas of the cloxacillin peaks obtained from the *Assay preparations* and the *Standard preparations*, respectively.

## Cloxacillin Benzathine Intramammary Infusion

» Cloxacillin Benzathine Intramammary Infusion is a suspension of Cloxacillin Benzathine in a suitable oil vehicle. It has a potency equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cloxacillin ( $C_{19}H_{18}ClN_3O_5S$ ).

**Packaging and storage**—Preserve in disposable syringes that are well-closed containers, except that where the Intramammary Infusion is labeled as sterile, the individual syringes or cartons are sealed and tamper-proof so that sterility is assured at time of use.

**Labeling**—Label it to indicate that it is for veterinary use only. Intramammary Infusion that is sterile may be so labeled.

### USP Reference standards (11)—

USP Cloxacillin Benzathine RS

USP Cloxacillin Sodium RS

**Identification, Infrared Absorption** (197K)—Obtain the test specimen as follows. Transfer a quantity of Intramammary Infusion, equivalent to about 500 mg of cloxacillin, to a 50-mL centrifuge tube, add 25 mL of toluene, mix, and centrifuge. Decant and discard the toluene. Wash the residue with four 25-mL portions of toluene, sonicating for about 30 seconds after each addition of toluene. Dry the residue in vacuum over silica gel.

**Sterility** (71) (where labeled as being sterile)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, to use Soybean–Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, and to shake the tubes once daily.

**Water, Method I** (921): not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

### Assay—

0.1M Phosphate buffer, Mobile phase, Diluent, *Standard preparations*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Cloxacillin Benzathine*.

**Assay preparations**—In duplicate, quantitatively express the entire contents of a syringe of Cloxacillin Benzathine Intramammary Infusion into a 500-mL volumetric flask. Add about 300 mL of methanol, and stir for 45 minutes  $\pm$  1 minute. Dilute with methanol to volume, and stir for an additional 10 minutes  $\pm$  1 minute. Immediately transfer 45 mL of the resulting solution to a 50-mL polypropylene centrifuge tube, and centrifuge for 10 minutes. From the supernatant remove an aliquot, and dilute with a sufficient volume of *Diluent* to prepare a solution containing about 100  $\mu$ g of cloxacillin per mL.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparations* and the *Assay preparations* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in

$\mu$ g, of  $C_{19}H_{18}ClN_3O_5S$  in each syringe of Cloxacillin Benzathine Intramammary Infusion taken by the formula:

$$P(CD/1000)(r_U / r_S)$$

in which  $P$  is the assigned potency, in  $\mu$ g of cloxacillin per mg, of USP Cloxacillin Sodium RS;  $C$  is the concentration, in  $\mu$ g per mL, of cloxacillin sodium in the *Standard preparations*;  $D$  is the dilution factor used in preparing the *Assay preparations*; and  $r_U$  and  $r_S$  are the average peak areas of the cloxacillin peaks obtained from the *Assay preparations* and the *Standard preparations*, respectively.

## Cloxacillin Sodium

$C_{19}H_{17}ClN_3NaO_5S \cdot H_2O$  475.88

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[[3-(2-chlorophenyl)-5-methyl-4-isoxazolyl]carbon-yl]amino]-3,3-dimethyl-7-oxo-, monosodium salt, monohydrate, [2S-(2 $\alpha$ ,5 $\alpha$ ,6 $\beta$ )].

Monosodium (2S,5R,6R)-6-[3-(o-chlorophenyl)-5-methyl-4-isoxazolecarboxamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [7081-44-9].

Anhydrous 457.87 [642-78-4].

» Cloxacillin Sodium contains the equivalent of not less than 825  $\mu$ g of cloxacillin ( $C_{19}H_{18}ClN_3O_5S$ ) per mg.

**Packaging and storage**—Preserve in tight containers, and store at a temperature not exceeding 25°.

**Labeling**—Where it is intended for use in preparing sterile dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of sterile dosage forms.

### USP Reference standards (11)—

USP Cloxacillin Sodium RS

### Identification—

**A: Infrared Absorption** (197K).

**B:** It responds to the tests for *Sodium* (191).

**Crystallinity** (695): meets the requirements.

**Sterility** (71)—Where the label states that Cloxacillin Sodium is sterile, it meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, to use Soybean–Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, and to shake the tubes once daily.

**pH** (791): between 4.5 and 7.5, in a solution containing 10 mg per mL.

**Water, Method I** (921): between 3.0% and 5.0%.

**Dimethylaniline** (223): meets the requirement.

### Assay—

**Buffer**—Prepare a 0.02 M solution of monobasic potassium phosphate in water, and adjust with 2 N sodium hydroxide to a pH of 6.8.

**Mobile phase**—Prepare a mixture of *Buffer* and acetonitrile (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Prepare a solution of USP Cloxacillin Sodium RS in *Buffer* having a known concentration of about 0.55 mg per mL.

**Assay preparation**—Transfer about 110 mg of Cloxacillin Sodium, accurately weighed, to a 200-mL volumetric flask, dilute with *Buffer* to volume, and mix. Stir with the aid of a magnetic stirrer for 5 minutes to dissolve.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S) in each mg of Cloxacillin Sodium taken by the formula:

$$200(CE / W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cloxacillin Sodium RS in the *Standard preparation*; E is the cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S) equivalent, in µg per mg, of USP Cloxacillin Sodium RS; W is the weight, in mg, of Cloxacillin Sodium taken to prepare the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the cloxacillin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cloxacillin Sodium Capsules

» Cloxacillin Sodium Capsules contain the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—  
USP Cloxacillin Sodium RS

**Dissolution** <711>—

*Medium*: 0.05 M pH 6.8 potassium phosphate buffer; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S) dissolved by employing the method set forth in the *Assay*, in comparison with a *Standard solution* having a known concentration of USP Cloxacillin Sodium RS in the *Dissolution Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S) is dissolved in 30 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Water, Method I** <921>: not more than 5.0%.

**Assay**—

*Buffer, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Cloxacillin Sodium*.

**Assay preparation**—Weigh and finely powder the contents of not fewer than 10 Capsules. Transfer an accurately weighed quantity of the powder, equivalent to about

100 mg of cloxacillin, to a 200-mL volumetric flask, dilute with *Buffer* to volume, mix, and stir for 10 minutes. Filter about 25 mL of this mixture, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Cloxacillin Sodium*. Calculate the quantity, in mg, of cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S) in the portion of Capsule contents taken by the formula:

$$0.2CE(r_U / r_S)$$

in which the terms are as defined therein.

## Cloxacillin Sodium Intramammary Infusion

» Cloxacillin Sodium Intramammary Infusion is a suspension of Cloxacillin Sodium in a suitable natural or chemically modified vegetable oil vehicle with a suitable dispersing agent. It has a potency equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cloxacillin (C<sub>19</sub>H<sub>18</sub>ClN<sub>3</sub>O<sub>5</sub>S).

**Packaging and storage**—Preserve in disposable syringes that are well-closed containers, except that where the Intramammary Infusion is labeled as sterile, the individual syringes or cartons are sealed and tamper-proof so that sterility is assured at time of use.

**USP Reference standards** <11>—  
USP Cloxacillin Sodium RS

**Labeling**—Label it to indicate that it is for veterinary use only. Intramammary Infusion that is sterile may be so labeled.

**Identification, Infrared Absorption** <197K>—Obtain the test specimen as follows. Transfer a quantity of Intramammary Infusion, equivalent to about 500 mg of cloxacillin, to a 50-mL centrifuge tube, add 15 mL of isooctane, mix, and centrifuge. Decant and discard the isooctane. Wash the residue with two 15-mL portions of isooctane and two 15-mL portions of ethyl ether, and discard the washings. Dry the residue in a current of air.

**Sterility** <71> (where labeled as being sterile)—It meets the requirements when tested as directed for *Direct Inoculation of the Culture Medium* under *Test for Sterility of the Product to be Examined*, except to use Fluid Thioglycollate Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, to use Soybean-Casein Digest Medium containing polysorbate 80 solution (1 in 200) and an amount of sterile penicillinase sufficient to inactivate the cloxacillin in each tube, and to shake the tubes once daily.

**Water, Method I** <921>: not more than 1.0%, 20 mL of a mixture of toluene and methanol (7:3) being used in place of methanol in the titration vessel.

**Assay**—Proceed as directed for cloxacillin under *Antibiotics—Microbial Assays* <81>, expelling the contents of 1 syringe of Intramammary Infusion into a high-speed glass blender jar containing 499.0 mL of *Buffer No. 1* and 1.0 mL of polysorbate 80, and blending for 3 to 5 minutes. Allow to stand for 10 minutes, and dilute an accurately measured volume of the aqueous phase quantitatively and stepwise with *Buffer No. 1* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the *Standard*.

## Cloxacillin Sodium for Oral Solution

» Cloxacillin Sodium for Oral Solution is a dry mixture of Cloxacillin Sodium and one or more suitable buffers, colors, flavors, and preservatives. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cloxacillin ( $C_{19}H_{18}ClN_3O_5S$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cloxacillin Sodium RS

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 5.0 and 7.5, in the solution constituted as directed in the labeling.

**Water, Method I** (921): not more than 1.0%.

**Assay**—

*Buffer, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the Assay under Cloxacillin Sodium.

*Assay preparation*—Constitute Cloxacillin Sodium for Oral Solution as directed in the labeling. Transfer an accurately measured volume of the resulting solution, equivalent to about 125 mg of cloxacillin, to a 250-mL volumetric flask, dilute with *Buffer* to volume, mix, and stir for 15 minutes. Filter about 25 mL of this mixture, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the Assay under Cloxacillin Sodium. Calculate the quantity, in mg, of cloxacillin ( $C_{19}H_{18}ClN_3O_5S$ ) in the portion of Cloxacillin Sodium for Oral Solution taken by the formula:

$$0.25CE(r_U / r_S)$$

in which the terms are as defined therein.

## Clozapine

$C_{18}H_{19}ClN_4$  326.82  
5*H*-Dibenzo[*b,e*][1,4]diazepine, 8-chloro-11-(4-methyl-1-piperazinyl)-;  
8-Chloro-11-(4-methyl-1-piperazinyl)-5*H*-dibenzo[*b,e*][1,4]diazepine [5786-21-0].

### DEFINITION

Clozapine contains NLT 98.0% and NMT 102.0% of clozapine ( $C_{18}H_{19}ClN_4$ ), calculated on the dried basis.

### IDENTIFICATION

- A. INFRARED ABSORPTION** (197K)
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Methanol, triethylamine, and water (800: 0.75: 200)

**Diluent:** Methanol and water (80:20)

**Standard solution:** 0.1 mg/mL of USP Clozapine RS in *Diluent*

**System suitability stock solution:** Transfer 10 mg of USP Clozapine RS to a suitable container, add 5 mL of 0.1 N hydrochloric acid, and heat for 2 h at 90°. Transfer this solution to a 100-mL volumetric flask, add 15 mL of water, and dilute with methanol to volume.

**System suitability solution:** *Standard solution* and *System suitability stock solution* (1:1)

**Sample solution:** 0.1 mg/mL of Clozapine in *Diluent*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 257 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L7

**Flow rate:** 1 mL/min

**Injection size:** 10 μL

**Run time:** 3 times the retention time of clozapine

**System suitability**

**Samples:** *Standard solution* and *System Suitability solution*

**Suitability requirements**

**Resolution:** NLT 1.5 between clozapine and any other peak, *System suitability solution*

**Tailing factor:** NMT 1.5, *Standard solution*

**Relative standard deviation:** NMT 1.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of clozapine ( $C_{18}H_{19}ClN_4$ ) in the portion of Clozapine taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response of clozapine from the *Sample solution*

$r_S$  = peak response of USP Clozapine RS from the *Standard solution*

$C_S$  = concentration of USP Clozapine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Clozapine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS, Method II** (231): 20 ppm

#### • ORGANIC IMPURITIES

**Diluent:** Methanol and water (80:20)

**Buffer:** 2.0 g/L of monobasic potassium phosphate. Adjust with phosphoric acid (85%) to a pH of 2.4.

[NOTE—The pH of this solution must not be below 2.4.]

**Solution A:** Filtered and degassed mixture of acetonitrile, methanol, and *Buffer* (1:1:8)

**Solution B:** Filtered and degassed mixture of acetonitrile, methanol, and *Buffer* (4:4:2)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	100	0
4	100	0
24	0	100
29	0	100
40	100	0

**System suitability solution:** Dissolve 4 mg of USP Clozapine Resolution Mixture RS in 4 mL of methanol, add 1 mL of water, and dilute with *Diluent* to 10 mL.

**Standard solution:** 0.75 µg/mL of USP Clozapine RS in *Diluent*

**Sample solution:** 0.75 mg/mL prepared as follows. Transfer a suitable quantity of Clozapine to a suitable volumetric flask. Dissolve in 80% of the flask volume of methanol, and dilute with water to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 257 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L1

**Flow rate:** 1.2 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times are provided in *Table 2*.]

#### Suitability requirements

**Resolution:** NLT 2.5 between *Impurity C* and clozapine, *System suitability solution*

**Relative standard deviation:** NMT 5.0% for clozapine, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

[NOTE—Disregard any peak with an area less than 0.5 times the area of the clozapine peak from the *Standard solution*.]

Calculate the percentage of each related compound and any unknown impurity in the portion of Clozapine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of any impurity from the *Sample solution*

$r_S$  = peak response of clozapine from the *Standard solution*

$C_S$  = concentration of USP Clozapine RS from the *Standard solution* (mg/mL)

$C_U$  = concentration of Clozapine from the *Sample solution* (mg/mL)

$F$  = relative response factor of the impurity (see *Table 2*)

**Acceptance criteria:** See *Table 2*.

**Table 2**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Impurity C <sup>a</sup>	0.9	1.0	0.3
Clozapine	1.0	—	—
Impurity D <sup>b</sup>	1.1	0.35	0.2
Impurity A <sup>c</sup>	1.6	1.2	0.1
Impurity B <sup>d</sup>	1.7	1.0	0.2
Individual unspecified impurity	—	1.0	0.10
Total impurities	—	—	0.6

<sup>a</sup> 8-Chloro-11-(piperazin-1-yl)-5H-dibenzo[*b,e*][1,4]diazepine.

<sup>b</sup> 4-Chloro-*N*¹-(2-[(4-methylpiperazin-1-yl)carbonyl]phenyl)benzene-1,2-diamine.

<sup>c</sup> 8-Chloro-5,10-dihydro-11H-dibenzo[*b,e*][1,4]diazepin-11-one.

<sup>d</sup> 11,11'-(Piperazine-1,4-diyl)bis(8-chloro-5H-dibenzo[*b,e*][1,4]diazepine).

#### SPECIFIC TESTS

- LOSS ON DRYING (731):** Dry a sample at 105° for 4 h: it loses NMT 0.5% of its weight.

#### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in well-closed containers.

#### USP REFERENCE STANDARDS (11)

USP Clozapine RS

USP Clozapine Resolution Mixture RS

Contains the following components:

Clozapine.

Impurity A: 8-chloro-5,10-dihydro-11H-dibenzo[*b,e*][1,4]diazepin-11-one.

Impurity B: 11,11'-(piperazine-1,4-diyl)bis(8-chloro-5H-dibenzo[*b,e*][1,4]diazepine).

Impurity C: 8-chloro-11-(piperazin-1-yl)-5H-dibenzo[*b,e*][1,4]diazepine.

Impurity D: 4-chloro-*N*¹-(2-[(4-methylpiperazin-1-yl)carbonyl]phenyl)benzene-1,2-diamine.

## Clozapine Tablets

#### DEFINITION

Clozapine Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of clozapine (C<sub>18</sub>H<sub>19</sub>ClN<sub>4</sub>).

#### IDENTIFICATION

- A.** The  $R_f$  value of the principal spot of the *Sample solution* corresponds to those of the principal spots of the *Standard solutions*, as obtained in the test for *Organic Impurities*.
- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

#### ASSAY

##### PROCEDURE

**Mobile phase:** Methanol, triethylamine, and water (800:0.75:200)

**Standard solution:** 0.125 mg/mL of USP Clozapine RS prepared as follows. Transfer the required amount of USP Clozapine RS to a suitable volumetric flask. Dissolve in 80% of the flask volume of methanol. [NOTE—Dissolve the Reference Standard in methanol, and dilute with water to obtain the final concentration. The final solvent composition of methanol and water is about 8:2.]

**System suitability stock solution:** Transfer 10 mg of clozapine to a suitable container, add 5 mL of 0.1 N hydrochloric acid, and heat for 2 h at 90°. Transfer this solution to a 100-mL volumetric flask, add 15 mL of water, and dilute with methanol to volume.

**System suitability solution:** *Standard solution* and *System suitability stock solution* (1:1)

**Sample solution:** Transfer 125 mg of clozapine from a quantity of finely powdered Tablets (NLT 20) to a 1-L volumetric flask. Dissolve in 640 mL of methanol, sonicate for 10 min, dilute with water to volume, mix, and filter.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 257 nm

**Column:** 4.0-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 1.5 between the clozapine peak and any other peak, *System suitability solution*

**Column efficiency:** NLT 1500 theoretical plates, *Standard solution*

**Relative standard deviation:** NMT 2.0% for replicate injections, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of clozapine ( $C_{18}H_{19}ClN_4$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Clozapine RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of clozapine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

#### PERFORMANCE TESTS

##### • DISSOLUTION <711>

**Medium:** pH 4.0 acetate buffer prepared as follows. Dissolve 2 g of sodium hydroxide in 450 mL of water. Adjust with glacial acetic acid to a pH of 4.0. Dilute to 1 L; 900 mL

**Apparatus 1:** 100 rpm

**Time:** 45 min

**Standard solution:** USP Clozapine RS in *Medium* in a concentration similar to the one expected in the *Sample solution*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

##### Instrumental conditions

**Mode:** UV

**Analytical wavelength:** 290 nm

##### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the percentage of clozapine ( $C_{18}H_{19}ClN_4$ ) dissolved.

**Tolerances:** NLT 85% (Q) of the labeled amount of clozapine ( $C_{18}H_{19}ClN_4$ ) is dissolved.

##### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

#### IMPURITIES

##### • ORGANIC IMPURITIES

**Diluent:** Chloroform and methanol (4:1)

**Standard stock solution:** 5.0 mg/mL of USP Clozapine RS in *Diluent*

**Standard solutions:** Dilute portions of the *Standard stock solution* with *Diluent* to obtain the following solutions.

Standard solution	Dilution	Concentration ( $\mu\text{g/mL}$ of RS)	Percentage (for comparison with Sample)
A	1 in 200	25	0.5
B	1 in 250	20	0.4
C	1 in 333	15	0.3
D	1 in 500	10	0.2
E	1 in 1000	5	0.1

**Sample solution:** Transfer an equivalent to 125 mg of clozapine from a portion of finely powdered Tablets (NLT 20) to a 25-mL volumetric flask. Dissolve in 20 mL of *Diluent*, shake by mechanical means for 15 min, dilute with *Diluent* to volume, and filter.

##### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 20  $\mu\text{L}$

**Developing solvent system:** *n*-Heptane, chloroform, dehydrated alcohol, and ammonium hydroxide (30:30:30:1)

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Examine the plate under short-wavelength UV light, and compare the intensities of any secondary spots of the *Sample solution* with those of the principal spots of the *Standard solutions*.

**Acceptance criteria:** No secondary spot of the *Sample solution* is larger or more intense than the principal spot of *Standard solution A* (NMT 0.5%), and the sum of the intensities of the secondary spots from the *Sample solution* corresponds to NMT 2.0%.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>  
USP Clozapine RS

## Coal Tar

» Coal Tar is the tar obtained as a by-product during the destructive distillation of bituminous coal at temperatures in the range of 900° to 1100°. It may be processed further either by extraction with alcohol and suitable dispersing agents and maceration times or by fractional distillation with or without the use of suitable organic solvents.

**Packaging and storage**—Preserve in tight containers.

**Residue on ignition** <281>: not more than 2.0%, from 100 mg.

## Coal Tar Ointment

» Prepare Coal Tar Ointment as follows.

Coal Tar . . . . .	10 g
Polysorbate 80 . . . . .	5 g
Zinc Oxide Paste . . . . .	985 g
to make . . . . .	1000 g

Blend the Coal Tar with the Polysorbate 80, and incorporate the mixture with the Zinc Oxide Paste.

**Packaging and storage**—Preserve in tight containers.

## Coal Tar Topical Solution

» Prepare Coal Tar Topical Solution as follows.

Coal Tar .....	200 g
Polysorbate 80 .....	50 g
Alcohol, a sufficient quantity, to make .....	1000 mL

Mix the Coal Tar with 500 g of washed sand (see under *Reagents* in the section *Reagents, Indicators, and Solutions*), and add the Polysorbate 80 and 700 mL of Alcohol. Macerate the mixture for 7 days in a closed vessel with frequent agitation. Filter, and rinse the vessel and the filter with sufficient Alcohol to make the product measure 1000 mL.

**Packaging and storage**—Preserve in tight containers.

**Alcohol content** (611): between 81.0% and 86.0% of  $C_2H_5OH$ .

## Cyanocobalamin Co 57 Capsules

Vitamin  $B_{12-^{57}Co}$ .

Vitamin  $B_{12-^{57}Co}$  [41559-38-0; 13115-03-2].

» Cyanocobalamin Co 57 Capsules contain Cyanocobalamin in which a portion of the molecules contain radioactive cobalt ( $^{57}Co$ ) in the molecular structure. Each Capsule contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{57}Co$  as cyanocobalamin expressed in megabecquerels (microcuries) at the time indicated in the labeling. The cyanocobalamin content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount.

**Specific activity:** not less than 0.02 MBq (0.5  $\mu Ci$ ) per  $\mu g$  of cyanocobalamin.

**Packaging and storage**—Preserve in well-closed, light-resistant containers, and store in a cold place.

**Labeling**—Label the Capsules to include the following: the date of calibration; the amount of cyanocobalamin expressed in  $\mu g$  per Capsule; the amount of  $^{57}Co$  as cyanocobalamin expressed in megabecquerels (microcuries) per Capsule at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{57}Co$  is 270.9 days.

**USP Reference standards** (11)—

USP Cyanocobalamin RS

**Radionuclide identification**—A solution of 1 or more Capsules in water responds to the test for *Radionuclide identification* under *Cyanocobalamin Co 57 Oral Solution*.

**Disintegration** (701): 30 minutes, testing 1 Capsule in 1 N hydrochloric acid maintained at  $37 \pm 2^\circ$  as the immersion fluid.

**Uniformity of dosage units:** meet the requirements.

**Procedure for content uniformity**—Determine the instrument response of each of 10 Capsules by measurement in a suitable counting assembly and under identical geometric conditions. Calculate the average radioactivity per Capsule. The radioactivity of none of the Capsules differs by more than 10% from the average. The relative standard deviation is less than 3.5%.

**Radiochemical purity**—Dissolve the contents of 1 Capsule in 1 mL of water, allow to stand for about 10 minutes, and centrifuge. Use the supernatant as the *Test solution*. It meets the requirements of the test for *Radiochemical purity* under *Cyanocobalamin Co 57 Oral Solution*.

**Radionuclidic purity**—Dissolve the contents of 1 Capsule in 1 mL of water, allow to stand for about 10 minutes, and centrifuge. Use the supernatant. It meets the requirements of the test for *Radionuclidic purity* under *Cyanocobalamin Co 57 Oral Solution*.

**Content of cyanocobalamin**—Determine the content, in  $\mu g$  per Capsule, of cyanocobalamin as directed under *Vitamin  $B_{12}$  Activity Assay* (171).

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly* under *Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu Ci$ ) per Capsule, of Cyanocobalamin Co 57 Capsules by use of a calibrated system as directed under *Radioactivity* (821).

## Cyanocobalamin Co 57 Oral Solution

Vitamin  $B_{12-^{57}Co}$ .

Vitamin  $B_{12-^{57}Co}$  [41559-38-0; 13115-03-2].

» Cyanocobalamin Co 57 Oral Solution is a solution suitable for oral administration, containing Cyanocobalamin in which a portion of the molecules contain radioactive cobalt ( $^{57}Co$ ) in the molecular structure. Cyanocobalamin Co 57 Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{57}Co$  as cyanocobalamin expressed in megabecquerels (microcuries) per mL at the time indicated in the labeling. The cyanocobalamin content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount. Cyanocobalamin Co 57 Oral Solution contains a suitable antimicrobial agent.

**Specific activity:** not less than 0.02 MBq (0.5  $\mu Ci$ ) per  $\mu g$  of cyanocobalamin.

**Packaging and storage**—Preserve in tight containers, protected from light, and store in a cold place.

**Labeling**—Label it to include the following: the date of calibration; the amount of  $^{57}Co$  as cyanocobalamin expressed as total megabecquerels (microcuries) and as megabecquerels (microcuries) per mL at the time of calibration; the amount of cyanocobalamin expressed in  $\mu g$  per mL; the name and quantity of the added preservative; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{57}Co$  is 270.9 days, and directs that the Oral Solution be protected from light.

**USP Reference standards** (11)—

USP Cyanocobalamin RS

**Radionuclide identification** (see *Radioactivity* (821))—Its gamma-ray spectrum is identical to that of a specimen of

$^{57}\text{Co}$  of known purity that exhibits a major photopeak having an energy of 0.122 MeV.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.0 and 5.5.

**Radiochemical purity**—

*Mobile phase*—Prepare a solution of 10.0 g of dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 3.5. Prepare a mixture of this solution and methanol (73.5:26.5), mix, and degas. Use within 2 days.

*Test solution*—Use the Oral Solution.

*Standard solution*—Transfer about 10 mg of cyanocobalamin, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 361-nm detector, a gamma detector adjusted for  $^{57}\text{Co}$  and a 4.6-mm  $\times$  25-cm stainless steel column that contains 5- $\mu\text{m}$  packing L7. The flow rate is about 1 mL per minute.

*Procedure*—Inject about 100  $\mu\text{L}$  of the *Standard solution* into the chromatograph, record the chromatogram for 30 minutes, and note the retention time of the cyanocobalamin peak. Inject 100  $\mu\text{L}$  of the *Test solution* into the chromatograph, and record the chromatogram for three times the retention time of cyanocobalamin. Measure the peak areas using the gamma detector, and calculate the percentage of cyanocobalamin present as cyanocobalamin  $^{57}\text{Co}$  in the portion of Oral Solution taken by the formula:

$$100(r_U / r_T)$$

in which  $r_U$  is the peak response for cyanocobalamin  $^{57}\text{Co}$  obtained from the *Test solution*; and  $r_T$  is the total of all the peak area responses in the radiochromatogram obtained from the *Test solution*. Not less than 90% of the total radioactivity is found as cyanocobalamin  $^{57}\text{Co}$ .

**Radionuclidic purity**—Using a suitable calibrated instrument (see *Radioactivity* (821)) and standardized solutions of  $^{58}\text{Co}$ ,  $^{57}\text{Co}$ , and  $^{60}\text{Co}$ , record the gamma spectrum of the Oral Solution. The spectrum does not differ significantly from that of the standardized  $^{57}\text{Co}$  solution. Determine the relative amounts of  $^{58}\text{Co}$ ,  $^{57}\text{Co}$ , and  $^{60}\text{Co}$  present. Cobalt 58 has a half-life of 70.9 days, and its presence is shown by 0.511-MeV and 0.811-MeV gamma photons. Cobalt 60 has a half-life of 5.27 years, and its presence is shown by 1.173-MeV and 1.333-MeV gamma photons. Not more than 1% of the total radioactivity is due to  $^{60}\text{Co}$ ; and not more than 2% of the total radioactivity is due to  $^{58}\text{Co}$ ,  $^{60}\text{Co}$ , and other radionuclidic impurities.

**Content of cyanocobalamin**—Determine the content, in  $\mu\text{g}$  per mL, of cyanocobalamin as directed under *Vitamin B<sub>12</sub> Activity Assay* (171).

**Assay for radioactivity**—Using a suitable counting assembly (see *Selection of a Counting Assembly under Radioactivity* (821)), determine the radioactivity, in MBq ( $\mu\text{Ci}$ ) per mL, of Oral Solution by use of a calibrated system as directed under *Radioactivity* (821).

## Cyanocobalamin Co 58 Capsules

Vitamin B<sub>12</sub>-  $^{58}\text{Co}$

» Cyanocobalamin Co 58 Capsules contain Cyanocobalamin in which a portion of the molecules contain radioactive cobalt ( $^{58}\text{Co}$ ) in the molecular structure. Each Capsule contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $^{58}\text{Co}$  as cyanocobalamin expressed in megabecquerels (or microcuries) at the time indicated in the labeling. The cyanocobalamin content is not less than 90.0 percent and not more than 110.0 percent of the labeled amount.

**Specific activity:** not less than 0.02 MBq (or 0.5  $\mu\text{Ci}$ ) per  $\mu\text{g}$  of cyanocobalamin.

**Packaging and storage**—Preserve in well-closed, light-resistant containers, and store in a cold place.

**Labeling**—Label it to include the following: the date of calibration; the amount of cyanocobalamin expressed in  $\mu\text{g}$  per Capsule; the amount of  $^{58}\text{Co}$  as cyanocobalamin expressed in MBq (or  $\mu\text{Ci}$ ) per Capsule at the time of calibration; the expiration date; and the statement "Caution—Radioactive Material." The labeling indicates that in making dosage calculations, correction is to be made for radioactive decay, and also indicates that the radioactive half-life of  $^{58}\text{Co}$  is 70.9 days.

**USP Reference standards** (11)—

USP Cyanocobalamin RS

**Disintegration** (701): 30 minutes, testing one Capsule in 1 N hydrochloric acid maintained at  $37 \pm 2^\circ$  as the immersion fluid.

**Radionuclide identification** (821)—

**A:** Its gamma-ray spectrum is identical to that of a specimen of  $^{58}\text{Co}$  that exhibits major photopeaks at 0.511 MeV (annihilation radiation) and 0.811 MeV.

**B:** The retention time of the major peak in the radiochromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*, as obtained in the test for *Radiochemical purity*.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Determine the instrument response of each of 10 Capsules by measurement in a suitable counting assembly and under identical geometric conditions. Calculate the average radioactivity per Capsule. The radioactivities of none of the Capsules differ by more than 10% from the average. The relative standard deviation is less than 3.5%.

**Radiochemical purity**—

*Mobile phase*—Prepare a solution of 10.0 g of dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 3.5. Prepare a mixture of the solution so obtained and methanol (73.5:26.5), mix, and degas. Use within 2 days. Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

*Standard solution*—Transfer about 10 mg of USP Cyanocobalamin RS, accurately weighed, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 2.0 mL of the solution so obtained to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Test solution*—Dissolve the contents of one Capsule in 1 mL of water, allow to stand for about 10 minutes, and centrifuge. Use the supernatant.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 361-nm detector,

a gamma detector adjusted for  $^{58}\text{Co}$ , and a 4.6-mm  $\times$  25-cm stainless steel column that contains 5- $\mu\text{m}$  packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*.

**Procedure**—Inject about 100  $\mu\text{L}$  of the *Standard solution* into the chromatograph, record the chromatogram for 30 minutes, and note the retention time of the cyanocobalamin peak. Inject 100  $\mu\text{L}$  of the *Test solution* into the chromatograph, record the chromatogram for three times the retention time of cyanocobalamin, and measure the peak areas using the gamma detector. Calculate the percentage of cyanocobalamin present as cyanocobalamin  $^{58}\text{Co}$  in the portion of Capsules taken by the formula:

$$100(r_U / r_S)$$

in which  $r_U$  is the peak area for cyanocobalamin  $^{58}\text{Co}$  obtained from the *Test solution*; and  $r_S$  is the sum of all the peak areas in the radiochromatogram obtained from the *Test solution*: not less than 90% of the total radioactivity is found as cyanocobalamin  $^{58}\text{Co}$ .

**Radionuclidic purity**—Using a suitable, calibrated instrument (see *Radioactivity* <821>) and standardized solutions of  $^{58}\text{Co}$ ,  $^{57}\text{Co}$ , and  $^{60}\text{Co}$ , record the gamma spectrum. The spectrum does not differ significantly from that of the standardized  $^{58}\text{Co}$  solution. Determine the relative amounts of  $^{58}\text{Co}$ ,  $^{57}\text{Co}$ , and  $^{60}\text{Co}$  present. Cobalt 57 has a half-life of 270.9 days, and its presence is shown by 0.122 MeV gamma photons. Cobalt 60 has a half-life of 5.27 years and its presence is shown by 1.173 MeV and 1.333 MeV gamma photons. Not more than 1% of the total radioactivity is due to  $^{60}\text{Co}$ ; and not more than 2% of the total radioactivity is due to  $^{57}\text{Co}$ ,  $^{60}\text{Co}$ , and other radionuclidic impurities.

**Content of cyanocobalamin**—Determine the content, in  $\mu\text{g}$  per Capsule, of cyanocobalamin as directed under *Vitamin B<sub>12</sub> Activity Assay* <171>.

**Assay for radioactivity** <821>—Using a suitable counting assembly (see *Selection of a Counting Assembly*) and calibrated system, determine the radioactivity, in MBq (or  $\mu\text{Ci}$ ) per Capsule, of Cyanocobalamin Co 58 Capsules.

## Cocaine

$\text{C}_{17}\text{H}_{21}\text{NO}_4$  303.35

8-Azabicyclo[3.2.1]octane-2-carboxylic acid, 3-(benzoyloxy)-8-methyl-, methyl ester, [1*R*-(*exo*,*exo*)]-.

Methyl 3 $\beta$ -hydroxy-1 $\alpha$ H,5 $\alpha$ H-tropane-2 $\beta$ -carboxylate benzoate (ester) [50-36-2].

» Cocaine, dried over phosphorus pentoxide for 3 hours, contains not less than 99.0 percent and not more than 101.0 percent of  $\text{C}_{17}\text{H}_{21}\text{NO}_4$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** <11>—  
USP Cocaine Hydrochloride RS

### Identification—

**A: Ultraviolet Absorption** <197U>—

*Solution:* 15  $\mu\text{g}$  per mL.

*Medium:* dilute hydrochloric acid (1 in 120).

Absorptivities at 233 nm, calculated on the dried basis, do not differ by more than 3.0%.

**B:** It meets the requirements under *Identification—Organic Nitrogenous Bases* <181>, USP Cocaine Hydrochloride RS being used, and sodium carbonate TS being used in place of sodium hydroxide TS.

**C:** Dissolve about 100 mg in a mixture of 0.4 mL of dilute hydrochloric acid (1 in 12) and water to make 5 mL, and add 5 drops of chromium trioxide solution (1 in 20): a yellow precipitate is formed, and it quickly redissolves when the mixture is shaken. Add 1 mL of hydrochloric acid: a permanent, orange-colored, crystalline precipitate is formed.

**D:** Dissolve about 10 mg in 1 mL of dilute hydrochloric acid (1 in 600), and evaporate on a steam bath just to dryness. Dissolve the residue in 2 drops of water, and add 1 mL of potassium permanganate solution (1 in 300): a violet, crystalline precipitate is formed, and it appears brownish violet when collected on a filter, and shows characteristic violet-red crystalline aggregates under the low power of a microscope, similar to those obtained from USP Cocaine Hydrochloride RS.

**Melting range, Class I** <741>: between 96° and 98°.

**Loss on drying** <731>—Dry it over phosphorus pentoxide for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

**Readily carbonizable substances** <271>—Dissolve about 500 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid A*.

**Limit of cinnamyl-cocaine and other reducing substances**—Dissolve about 300 mg of finely powdered Cocaine in 1 mL of dilute hydrochloric acid (1 in 12) with the aid of heat, if necessary, and dilute with water to 15 mL. Mix 5 mL of this solution with 0.3 mL of dilute sulfuric acid (1 in 35) and 0.1 mL of potassium permanganate solution (1 in 300): the violet color does not disappear entirely within 30 minutes.

**Limit of isotropyl-cocaine**—Dilute in a beaker 5 mL of the solution of Cocaine prepared in the test for *Cinnamyl-cocaine and other reducing substances* with 80 mL of water, add 0.2 mL of 6 N ammonium hydroxide, and stir the solution vigorously for 5 minutes, occasionally rubbing the inner wall of the beaker with a stirring rod: a crystalline precipitate of cocaine is formed, and the supernatant is clear.

**Assay**—Dissolve about 600 mg of Cocaine, previously dried and accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 30.34 mg of  $\text{C}_{17}\text{H}_{21}\text{NO}_4$ .

## Cocaine Hydrochloride

$\text{C}_{17}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$  339.81

8-Azabicyclo[3.2.1]octane-2-carboxylic acid, 3-(benzoyloxy)-8-methyl-, methyl ester, hydrochloride, 1*R*-(*exo*,*exo*)-.

Methyl 3 $\beta$ -hydroxy-1 $\alpha$ H,5 $\alpha$ H-tropane-2 $\beta$ -carboxylate, benzoate (ester) hydrochloride [53-21-4].

» Cocaine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of  $\text{C}_{17}\text{H}_{21}\text{NO}_4 \cdot \text{HCl}$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** <11>—  
USP Cocaine Hydrochloride RS

**Identification—**

**A:** It meets the requirements under *Identification—Organic Nitrogenous Bases* (181), sodium carbonate TS being used in place of 1 N sodium hydroxide.

**B:** To 5 mL of a solution (1 in 50) add 5 drops of chromium trioxide solution (1 in 20): a yellow precipitate is formed, and it quickly redissolves when the mixture is shaken gently. Add 1 mL of hydrochloric acid: a permanent, orange-colored crystalline precipitate is formed.

**C:** To a solution of about 10 mg in 2 drops of water add 1 mL of 0.1 N potassium permanganate: a violet, crystalline precipitate is formed, and it appears brownish violet when collected on a filter, and shows characteristic, violet-red crystalline aggregates under the low power of a microscope.

**D:** It responds to the tests for *Chloride* (191).

**Specific rotation** (7815): between  $-71^{\circ}$  and  $-73^{\circ}$ .

*Test solution:* 20 mg, previously dried, per mL, in water.

**Acidity—**Dissolve 500 mg in 10 mL of water, add 1 drop of methyl red TS, and titrate with 0.020 N sodium hydroxide: not more than 0.50 mL is required to produce a yellow color.

**Loss on drying** (731)—Dry it over silica gel for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Readily carbonizable substances** (271)—Dissolve 500 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid F*.

**Limit of cinnamyl-cocaine and other reducing substances—**To 5 mL of a solution (1 in 50) add 0.3 mL of 1 N sulfuric acid and 0.10 mL of 0.10 N potassium permanganate: the violet color does not disappear entirely within 30 minutes.

**Limit of isotropyl-cocaine—**Dilute 5 mL of a solution (1 in 50) in a beaker with 80 mL of water, add 0.2 mL of 6 N ammonium hydroxide, stir the solution vigorously during 5 minutes, occasionally rubbing the inner wall of the beaker with a stirring rod: a crystalline precipitate of cocaine is formed, and the supernatant is clear.

**Assay—**Dissolve about 500 mg of Cocaine Hydrochloride, accurately weighed, in a mixture of 40 mL of glacial acetic acid and 10 mL of mercuric acetate TS. Add 2 drops of quinaldine red TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 33.98 mg of  $C_{17}H_{21}NO_4 \cdot HCl$ .

## Cocaine Hydrochloride Tablets for Topical Solution

» Cocaine Hydrochloride Tablets for Topical Solution contain not less than 91.0 percent and not more than 109.0 percent of the labeled amount of  $C_{17}H_{21}NO_4 \cdot HCl$ .

**Packaging and storage—**Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—  
USP Cocaine Hydrochloride RS

**Identification—**

**A:** Add 5 drops of chromium trioxide solution (1 in 20) to 5 mL of a filtered solution of Tablets, equivalent to cocaine hydrochloride solution (1 in 50): a yellow precipitate is formed and it redissolves when the mixture is shaken. On the addition of 1 mL of hydrochloric acid, a permanent, yellowish orange, crystalline precipitate is formed.

**B:** Dissolve a portion of powdered Tablets, equivalent to about 10 mg of cocaine hydrochloride, in 1 mL of water, filter, and add 2 mL of 0.1 N potassium permanganate: a red-purple, crystalline precipitate, which appears brown when collected on a filter, is formed, and it shows characteristic, crystalline aggregates under the low power of a microscope.

**C:** Add silver nitrate TS, dropwise, to a filtered solution of Tablets, equivalent to cocaine hydrochloride solution (1 in 20): a white precipitate is formed, and it is insoluble in nitric acid.

**Disintegration** (701): 15 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity—*Place 1 Tablet in a 100-mL volumetric flask, add 50 mL of water, and shake the flask until the tablet is dissolved. Dilute with water to volume, mix, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the subsequent filtrate, if necessary, with water to provide a solution containing approximately 80  $\mu$ g of cocaine hydrochloride per mL. Concomitantly determine the absorbances of this test solution and a Standard solution of USP Cocaine Hydrochloride RS in the same medium having a known concentration of about 80  $\mu$ g per mL, in 1-cm cells at the wavelength of maximum absorbance at about 275 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_{17}H_{21}NO_4 \cdot HCl$  in the Tablet by the formula:

$$(T/D)C(A_U/A_S)$$

in which *T* is the labeled quantity, in mg, of cocaine hydrochloride in the Tablet; *D* is the concentration, in  $\mu$ g per mL, of cocaine hydrochloride in the test solution, based upon the labeled quantity per Tablet and the extent of dilution; *C* is the concentration, in  $\mu$ g per mL, of USP Cocaine Hydrochloride RS in the Standard solution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay—**Weigh and finely powder not fewer than 20 Tablets. Dissolve an accurately weighed portion of the powder, equivalent to about 60 mg of cocaine hydrochloride, in 10 mL of water, render the solution slightly alkaline with 6 N ammonium hydroxide, and completely extract the cocaine with small successive portions of ether. Evaporate the combined ether extracts on a steam bath to one-half their volume, transfer the remaining liquid to a separator, and wash with three 5-mL portions of water. Shake the water washings with a small portion of ether, and add the ether washing to the combined ether extracts. Add 10.0 mL of 0.05 N sulfuric acid VS to the ether solution, agitate the mixture thoroughly, and draw off the acidified water layer into a beaker. Wash the ether with two small portions of water, add the washings to the acid liquid, and titrate the excess acid with 0.02 N sodium hydroxide VS, using methyl red TS as the indicator. Each mL of 0.05 N sulfuric acid is equivalent to 16.99 mg of  $C_{17}H_{21}NO_4 \cdot HCl$ .

## Cocaine and Tetracaine Hydrochlorides and Epinephrine Topical Solution

**DEFINITION**

Cocaine and Tetracaine Hydrochlorides and Epinephrine Topical Solution contains NLT 3.6 g and NMT 4.4 g of cocaine hydrochloride ( $C_{17}H_{21}NO_4 \cdot HCl$ ), NLT 0.90 g and NMT 1.10 g of tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ), and NLT 20 mg and NMT 30 mg of epinephrine ( $C_9H_{13}NO_3$ ) in each 100 mL of Topical Solution.

Prepare Cocaine and Tetracaine Hydrochlorides and Epinephrine Topical Solution as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Cocaine Hydrochloride	4.0 g
Tetracaine Hydrochloride	1.0 g
Epinephrine Injection (1:1000)	25.0 mL
Benzalkonium Chloride	10 mg
Edetate Disodium	6.4 mg
Sodium Chloride Injection (0.9%)	35 mL
Purified Water, a sufficient quantity to make	100 mL

Dissolve the *Cocaine Hydrochloride* and *Tetracaine Hydrochloride* in 25 mL of *Purified Water*, and add the *Epinephrine Injection* (1:1000). Separately dissolve *Edetate Disodium* in *Sodium Chloride Injection* (0.9%), and dilute quantitatively and stepwise, if necessary, with *Sodium Chloride Injection* (0.9%) to obtain 35 mL of a solution containing 6.4 mg of *Edetate Disodium*. Similarly, and separately, dissolve *Benzalkonium Chloride* in *Purified Water* (or use *Benzalkonium Chloride Solution*), and dilute quantitatively and stepwise, if necessary, with *Purified Water* to obtain 10 mL of a solution containing 10 mg of *Benzalkonium Chloride*. Combine the three solutions, add sufficient *Purified Water* to bring to final volume, and mix well.

## ASSAY

### • TETRACAINE HYDROCHLORIDE

**Solution A:** 6.3 g/L of monobasic potassium phosphate containing 0.55 g/L of sodium 1-octanesulfonate. Adjust with phosphoric acid to a pH of 2.5.

**Solution B:** Acetonitrile and *Solution A* (10:90). Pass through a suitable filter of 0.5-μm or finer pore size, and degas.

**Solution C:** Acetonitrile and *Solution A* (30:70). Pass through a suitable filter of 0.5-μm or finer pore size, and degas.

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution B (%)	Solution C (%)
0	100	0
5	100	0
10	0	100
24	0	100
25	100	0
75	100	0

**Standard solution:** 0.5 mg/mL of USP Tetracaine Hydrochloride RS

**Sample solution:** Transfer 0.5 mL of Topical Solution to a 10-mL volumetric flask, dilute with water to volume, and mix.

### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 3.9-mm × 30-cm; 10-μm packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 20 μL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Tailing factor:** NMT 1.5 for the analyte peak

**Relative standard deviation:** NMT 2.0% for replicate injections

## Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the quantity, in g, of tetracaine hydrochloride ( $C_{15}H_{24}N_2O_2 \cdot HCl$ ) in 100 mL of the Topical Solution:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times F$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of tetracaine hydrochloride in the *Standard solution* (mg/mL)

$D$  = dilution factor, 20

$V$  = final volume of Topical Solution, 100 mL

$F$  = conversion factor,  $10^{-3}$  g/mg

**Acceptance criteria:** 0.90–1.10 g

### • COCAINE HYDROCHLORIDE

**Solution A, Solution B, Solution C, Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay for Tetracaine Hydrochloride*.

**Standard solution:** 2 mg/mL of USP Cocaine Hydrochloride RS

## Analysis

**Samples:** *Standard solution* and *Sample solution*  
Calculate the quantity, in g, of cocaine hydrochloride ( $C_{17}H_{21}NO_4 \cdot HCl$ ) in 100 mL of the Topical Solution:

$$\text{Result} = (r_U/r_S) \times C_S \times D \times V \times F$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of cocaine hydrochloride in the *Standard solution* (mg/mL)

$D$  = dilution factor, 20

$V$  = final volume of Topical Solution, 100 mL

$F$  = conversion factor,  $10^{-3}$  g/mg

**Acceptance criteria:** 3.6–4.4 g

### • EPINEPHRINE

**Solution A, Solution B, Solution C, Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay for Tetracaine Hydrochloride*.

**Standard solution:** Transfer 3 mg of USP Epinephrine Bitartrate RS to a 25-mL volumetric flask, and dilute with water to volume. Transfer 4.0 mL of the resultant solution to a 25-mL volumetric flask, and dilute with water to volume.

## Analysis

**Samples:** *Sample solution* and *Standard solution*  
Calculate the quantity, in mg, of epinephrine ( $C_9H_{13}NO_3$ ) in 100 mL of the Topical Solution:

$$\text{Result} = (r_U/r_S) \times C_S \times (M_{r1}/M_{r2}) \times D \times V$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of epinephrine bitartrate in the *Standard solution* (mg/mL)

$M_{r1}$  = molecular weight of epinephrine, 183.20

$M_{r2}$  = molecular weight of epinephrine bitartrate, 333.29

$D$  = dilution factor, 20

$V$  = final volume of Topical Solution, 100 mL

**Acceptance criteria:** 20–30 mg

## SPECIFIC TESTS

- **pH** (791): 4.0–6.0

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in sterile, tight, light-resistant containers. Store in a refrigerator.
- **LABELING:** Label it to indicate that it is intended for external use only and that it is not to be used if a precipitate is present. The label states that it is to be protected from light.

- **BEYOND-USE DATE:** NMT 30 days after the date on which it was compounded
- **USP REFERENCE STANDARDS** (11)
  - USP Cocaine Hydrochloride RS
  - USP Epinephrine Bitartrate RS
  - USP Tetracaine Hydrochloride RS

## Cod Liver Oil

### DEFINITION

Cod Liver Oil is the partially destearinated fixed oil obtained from fresh livers of *Gadus morrhua* L. and other species of Fam. Gadidae. Cod Liver Oil contains, in each g, NLT 180 µg (600 USP Units) and NMT 750 µg (2500 USP Units) of vitamin A and NLT 1.5 µg (60 USP Units) and NMT 6.25 µg (250 USP Units) of vitamin D.

Cod Liver Oil may be flavored by the addition of NMT 1% of a suitable flavor or a mixture of flavors. A suitable antioxidant may be added.

### IDENTIFICATION

#### A. PRESENCE OF VITAMIN A

**Sample solution:** 25 mg/mL of Cod Liver Oil in chloroform

**Analysis:** To 1 mL of the *Sample solution* add 10 mL of antimony trichloride TS.

**Acceptance criteria:** A blue color results immediately.

#### B. FATTY ACID PROFILE

**Antioxidant solution:** 0.05 mg/mL of butylated hydroxytoluene in hexanes

**System suitability solution:** Prepare a mixture containing equal amounts of methyl palmitate, methyl stearate, methyl arachidate, and methyl behenate in *Antioxidant solution*.

**Standard stock solution:** 45 mg/mL of USP Cod Liver Oil RS in *Antioxidant solution*

**Standard solution:** Transfer 2.0 mL of the *Standard stock solution* into a quartz tube, and evaporate with a gentle stream of nitrogen. Add 1.5 mL of a 2% solution of sodium hydroxide in methanol, cap tightly with a polytetrafluoroethylene-lined cap, mix, and heat in a water bath for 7 min. Cool, add 2 mL of a 120 mg/mL solution of boron trichloride in methanol, cover with nitrogen, cap tightly, mix, and heat in a water bath for 30 min. Cool to 40°–50°, add 1 mL of isooctane, cap, and mix in a vortex mixer or shake vigorously for at least 30 s. Immediately add 5 mL of saturated sodium chloride solution, cover with nitrogen, cap, and mix in a vortex mixer or shake thoroughly for at least 15 s. Allow the upper layer to become clear, and transfer to a separate tube. Shake the methanol layer once more with 1 mL of isooctane, and combine the isooctane extracts. Wash the combined extracts twice with 1 mL of water, and dry over anhydrous sodium sulfate.

**Sample solution:** Proceed as directed for the *Standard solution*, except replace USP Cod Liver Oil RS with Cod Liver Oil.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.25-mm × 30-m fused silica capillary column bonded with a 0.25-µm film of phase G16

**Temperature**

**Injector:** 250°

**Detector:** 280°

**Column:** See *Table 1*.

**Table 1**

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
170	1	225	20

**Carrier gas:** Helium

**Split flow ratio:** 200:1

**Injection size:** 1 µL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Chromatogram similarity:** The chromatogram from the *Standard solution* is similar to the reference chromatogram supplied with USP Cod Liver Oil RS. Identify the retention times of the relevant fatty acid methyl esters by comparing the chromatogram of the *Standard solution* with the reference chromatogram supplied with USP Cod Liver Oil RS.

**Resolution:** NLT 1.3 between methyl oleate and methyl *cis*-vaccinate, and that between methyl gadoleate and methyl gondoate is sufficient for purposes of identification and area measurement, *Standard solution*

**Theoretical area percentages:** 24.4 ± 1 for methyl palmitate, 24.8 ± 1 for methyl stearate, 25.2 ± 1 for methyl arachidate, and 25.6 ± 1 for methyl behenate, *System suitability solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Identify the retention times of the relevant fatty acid methyl esters in the *Sample solution* by comparing the chromatogram of the *Sample solution* with that of the *Standard solution*.

Determine the number of fatty acid methyl esters in the *Sample solution*. The number of fatty acid methyl ester peaks exceeding 0.05% of the total area of fatty acid methyl esters is at least 24, and the 24 largest peaks of the methyl esters account for more than 90% of the total area. (These correspond to the following, in common elution order: 14:0, 15:0, 16:0, 16:1 *n*-7, 16:4 *n*-1, 18:0, 18:1 *n*-9, 18:1 *n*-7, 18:2 *n*-6, 18:3 *n*-3, 18:4 *n*-3, 20:1 *n*-11, 20:1 *n*-9, 20:1 *n*-7, 20:2 *n*-6, 20:4 *n*-6, 20:3 *n*-3, 20:4 *n*-3, 20:5 *n*-3, 22:1 *n*-11, 22:1 *n*-9, 21:5 *n*-3, 22:5 *n*-3, and 22:6 *n*-3.)

Calculate the area percentage for each fatty acid methyl ester in the portion of Cod Liver Oil taken:

$$\text{Result} = (r_A/r_B) \times 100$$

$r_A$  = peak area of each individual fatty acid methyl ester

$r_B$  = total area from all peaks, except the solvent peak and butylated hydroxytoluene

**Acceptance criteria:** The *Sample solution* meets the limits described in *Table 2*.

**Table 2**

Fatty Acid	Shorthand Notation	Lower Limit (Area %)	Upper Limit (Area %)
<b>Saturated fatty acids</b>			
Myristic acid	14:0	2.0	6.0
Palmitic acid	16:0	7.0	14.0
Stearic acid	18:0	1.0	4.0
<b>Monounsaturated fatty acids</b>			
Palmitoleic acid	16:1 <i>n</i> -7	4.5	11.5
<i>cis</i> -Vaccenic acid	18:1 <i>n</i> -7	2.0	7.0
Oleic acid	18:1 <i>n</i> -9	12.0	21.0
Gadoleic acid	20:1 <i>n</i> -11	1.0	5.5

Table 2 (Continued)

Fatty Acid	Shorthand Notation	Lower Limit (Area %)	Upper Limit (Area %)
Gondoic acid	20:1 <i>n</i> -9	5.0	17.0
Erucic acid	22:1 <i>n</i> -9	0	1.5
Cetoleic acid	22:1 <i>n</i> -11	5.0	12.0
<b>Polyunsaturated fatty acids</b>			
Linoleic acid	18:2 <i>n</i> -6	0.5	3.0
$\alpha$ -Linolenic acid	18:3 <i>n</i> -3	0	2.0
Morotic acid	18:4 <i>n</i> -3	0.5	4.5
Eicosapentaenoic acid	20:5 <i>n</i> -3	7.0	16.0
Docosahexaenoic acid	22:6 <i>n</i> -3	6.0	18.0

**ASSAY****• VITAMIN A**

**Sample:** 500 mg to 1 g of Cod Liver Oil

**Analysis:** Proceed as directed under *Vitamin A Assay* (571).

**Acceptance criteria:** 180  $\mu$ g (600 USP Units) to 750  $\mu$ g (2500 USP Units) of vitamin A per g of Cod Liver Oil

**• VITAMIN D**

**Solution A:** *n*-Amyl alcohol and dehydrated hexane (3:997)

**Solution B:** Acetonitrile, water, and phosphoric acid (96:3.8:0.2)

**Butylated hydroxytoluene solution:** 10 mg/mL of butylated hydroxytoluene in chromatographic hexane

**Aqueous potassium hydroxide solution:** Dissolve 800 mg of potassium hydroxide in 1000 mL of freshly boiled water, mix, and cool. [NOTE—Prepare this solution fresh daily.]

**Alcoholic potassium hydroxide solution:** Dissolve 3 g of potassium hydroxide in 50 mL of freshly boiled water, add 10 mL of alcohol, and dilute with freshly boiled water to 100 mL. [NOTE—Prepare this solution fresh daily.]

**Ascorbic acid solution:** 100 mg/mL of ascorbic acid in water. [NOTE—Prepare this solution fresh daily.]

**Internal standard solution:** 5  $\mu$ g/mL of USP Ergocalciferol RS in alcohol

**Standard stock solution:** 5  $\mu$ g/mL of USP Cholecalciferol RS in alcohol

**Standard solution:** Transfer 2.0 mL of the *Standard stock solution* and 2.0 mL of the *Internal standard solution* to a round-bottomed flask. Proceed as directed for *Sample solution 1* beginning with "Add 5 mL of..."

**Sample solution 1:** Transfer 4.00 g of Cod Liver Oil to a round-bottomed flask. Add 5 mL of *Ascorbic acid solution*, 100 mL of alcohol, and 10 mL of *Aqueous potassium hydroxide solution*, and mix. Reflux the mixture on a steam bath for 30 min. Add 100 mL of a 10 mg/mL sodium chloride solution. Cool rapidly under running water, and transfer the saponified mixture to a 500-mL separator, rinsing the saponification flask with 75 mL of a 10 mg/mL sodium chloride solution, and then with 150 mL of a mixture of ether and hexane (1:1). Shake the combined saponified mixture and rinsings vigorously for 30 s, and allow to stand until both layers are clear. Discard the lower layer. Wash the ether-hexane extracts by shaking vigorously with 50 mL of *Alcoholic potassium hydroxide solution*, and then washing with three 50-mL portions of a 10 mg/mL sodium chloride solution. Filter the upper layer through 5 g of anhydrous sodium sulfate on a fast filter paper into a 250-mL flask suitable for a rotary evaporator. Wash the filter with 10 mL of a mixture of ether and hexane (1:1), and combine with the extract. Evaporate the solvent at reduced pressure at a temperature not exceeding 30°, and fill with nitrogen when the evaporation is complete. Alternatively evaporate the solvent under a

gentle stream of nitrogen at a temperature not exceeding 30°. Dissolve the residue in 1.5 mL of *Butylated hydroxytoluene solution*. [NOTE—Gentle heating in an ultrasonic bath may be required. A large fraction of the white residue is cholesterol.]

**Sample solution 2:** To 4.00 g of Cod Liver Oil add 2.0 mL of *Internal standard solution*, and proceed as directed for *Sample solution 1* beginning with "Add 5 mL of..."

**Clean-up chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 265 nm

**Mobile phase:** *Solution A*

**Clean-up column:** 4.6-mm  $\times$  25-cm stainless steel; packing L10

**Injection size:** 350  $\mu$ L

**Analysis (clean-up)**

**Samples:** *Standard solution*, *Sample solution 1*, and *Sample solution 2*

Collect separately the eluates from 2 min before to 2 min after the retention time of cholecalciferol in a glass tube containing 1 mL of *Butylated hydroxytoluene solution* and fitted with a hermetic closure. Evaporate each tube under a stream of nitrogen at a temperature not exceeding 30°. Dissolve each residue in 1.5 mL of acetonitrile, and inject into the analytical chromatographic system below.

**Analytical chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 265 nm

**Mobile phase:** *Solution B*

**Analytical column:** 4.6-mm  $\times$  15-cm stainless steel; 5- $\mu$ m packing L1

**Injection size:** 200  $\mu$ L

**System suitability**

**Sample:** *Standard solution* (after the clean-up)

**Suitability requirements**

**Resolution:** NLT 1.4 between cholecalciferol and ergocalciferol

**Relative standard deviation:** NMT 2.0% for the cholecalciferol peak from replicate injections

**Analysis**

**Samples:** *Standard solution*, *Sample solution 1*, and *Sample solution 2* (after the clean-up)

Calculate the content of vitamin D, in  $\mu$ g/g, in the portion of Cod Liver Oil taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U)$$

$R_U$  = peak response of cholecalciferol relative to the corrected internal standard in the *Sample solution 2*, as calculated below

$R_S$  = peak response of cholecalciferol relative to the internal standard in the *Standard solution*

$C_S$  = concentration of USP Cholecalciferol RS in the *Standard solution* ( $\mu$ g/mL)

$C_U$  = concentration of Cod Liver Oil in *Sample solution 2* (g/mL)

$$R_U = r_{U2}/[r_{IS2} - (r_{IS1} \times r_{U2}/r_{U1})]$$

$r_{U2}$  = peak response for cholecalciferol from *Sample solution 2*

$r_{IS2}$  = peak response for the internal standard from *Sample solution 2*

$r_{IS1}$  = peak response for the internal standard from *Sample solution 1*

$r_{U1}$  = peak response for cholecalciferol from the *Sample solution 1*

**Acceptance criteria:** 1.5  $\mu$ g (60 USP Units) to 6.25  $\mu$ g (250 USP Units) of vitamin D per g of Cod Liver Oil

**SPECIFIC TESTS**

- **SPECIFIC GRAVITY** (841): 0.918–0.927
- **COLOR:** When viewed transversely in a tall, cylindrical, standard oil-specimen bottle of colorless glass of about 120-mL capacity, the color of the Cod Liver Oil is not more intense than that of a mixture of cobaltous chloride CS, ferric chloride CS, and water (11:76:33), in a similar bottle of the same internal diameter.
- **NONDESTEARINATED COD LIVER OIL**  
**Sample:** Cod Liver Oil  
**Analysis:** Fill a tall, cylindrical, standard oil-specimen bottle of 120-mL capacity with the *Sample* at a temperature between 23° and 28°, insert the stopper, and immerse the bottle in a mixture of ice and water for 3 h.  
**Acceptance criteria:** The oil remains clear and does not deposit stearin.
- **FATS AND FIXED OILS, Unsaponifiable Matter** (401): NMT 1.30%
- **FATS AND FIXED OILS, Acid Value** (401)  
**Sample solution:** Mix 15 mL of alcohol with 15 mL of ether, add 5 drops of phenolphthalein TS, and neutralize with 0.1 N sodium hydroxide. Dissolve 2.0 g of Cod Liver Oil in the mixture, and boil the oil solution gently under a reflux condenser for 10 min.  
**Analysis:** Cool, and titrate the mixture with 0.1 N sodium hydroxide VS to the production of a pink color that persists after shaking for 30 s.  
**Acceptance criteria:** NMT 1.0 mL of 0.1 N sodium hydroxide is required.
- **FATS AND FIXED OILS, Iodine Value** (401): 145–180
- **FATS AND FIXED OILS, Saponification Value** (401): 180–192  
 [NOTE—If carbon dioxide has been used as a preservative, expose the Cod Liver Oil in a shallow dish in a vacuum desiccator for 24 h before weighing the specimen for determination of the saponification value.]
- **FATS AND FIXED OILS, Anisidine Value** (401): NMT 30

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. It may be bottled or otherwise packaged in containers from which air has been expelled by the production of a vacuum or by an inert gas.
- **LABELING:** The vitamin A potency and vitamin D potency, when designated on the label, are expressed in USP Units/g of oil. The potencies may be expressed also in metric units, on the basis that 1 USP Vitamin A Unit equals 0.3 µg and 40 USP Vitamin D Units equals 1 µg. Where the content of docosahexaenoic acid or eicosapentaenoic acid is claimed, state the concentration in mg/g.
- **USP REFERENCE STANDARDS** (11)  
 USP Cholecalciferol RS  
 USP Cod Liver Oil RS  
 USP Ergocalciferol RS

**Codeine**

$C_{18}H_{21}NO_3 \cdot H_2O$  317.38  
 Morphinan-6-ol, 7,8-didehydro-4,5-epoxy-3-methoxy-17-methyl-, monohydrate, (5 $\alpha$ ,6 $\alpha$ )-  
 7,8-Didehydro-4,5 $\alpha$ -epoxy-3-methoxy-17-methylmorphinan-6 $\alpha$ -ol monohydrate [6059-47-8].  
 Anhydrous 299.37 [76-57-3].

» Codeine, dried at 80° for 4 hours, contains not less than 98.5 percent and not more than 100.5 percent of  $C_{18}H_{21}NO_3$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Codeine Sulfate RS

**Identification**—

**A: Infrared Absorption** (197K)—Proceed as directed with the codeine test specimen and the codeine standard specimen obtained from 50 mg of USP Codeine Sulfate RS dissolved in 15 mL of water, then rendered alkaline with 6 N ammonium hydroxide and extracted with several 10-mL portions of chloroform, followed by evaporation of the combined chloroform extracts on a steam bath to dryness, and drying at 80° for 4 hours.

**B: Ultraviolet Absorption** (197U)—

*Solution:* 100 µg per mL.

*Medium:* 0.1 N sulfuric acid.

Absorptivity at 284 nm, calculated on the dried basis, is between 112.9% and 119.9% of that of USP Codeine Sulfate RS.

**Melting range** (741)—When previously dried, it melts between 154° and 158°, but the range between beginning and end of melting does not exceed 2°.

**Loss on drying** (731)—Dry it at 80° for 4 hours: it loses not more than 6.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Readily carbonizable substances** (271)—Dissolve 10 mg in 5 mL of sulfuric acid: the solution has no more color than *Matching Fluid S*.

**Chromatographic purity**—Prepare a solution of it in dehydrated alcohol containing 40 mg per mL (*Solution A*). Dilute 2.0 mL of *Solution A* with dehydrated alcohol to 100 mL (*Solution B*). Dilute 1.0 mL of *Solution A* with dehydrated alcohol to 100 mL (*Solution C*). Apply separate 10-µL volumes of *Solution A*, *Solution B*, and *Solution C* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of dehydrated alcohol, cyclohexane, and ammonium hydroxide (72:30:6) until the solvent front has moved three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow the solvent to evaporate. Spray the plate with a reagent prepared by mixing 3 mL of chloroplatinic acid solution (1 in 10) with 97 mL of water, followed by the addition of 100 mL of potassium iodide solution (6 in 100), and examine the chromatogram: no spot obtained from *Solution A*, other than the principal spot and any spot observed at the origin, is more intense than the principal spot obtained from *Solution B* (2%); and not more than one such spot having an  $R_f$  greater than that of the principal spot is more intense than the principal spot obtained from *Solution C* (1%).

**Limit of morphine**—Dissolve about 50 mg of potassium ferricyanide in 10 mL of water, and add 1 drop of ferric chloride TS and 1 mL of a neutral or slightly acid solution of Codeine (1 in 100) prepared with the aid of sulfuric acid: no blue color is produced immediately.

**Assay**—Dissolve about 400 mg of Codeine, previously dried and accurately weighed, by warming it in 30.0 mL of 0.1 N sulfuric acid VS. Cool, and add 10 mL of water. Add methyl red TS, and titrate the excess acid with 0.1 N sodium hydroxide VS. Perform a blank determination (see *Residual Titrations* under *Titrimetry* (541)). Each mL of 0.1 N sulfuric acid is equivalent to 29.94 mg of  $C_{18}H_{21}NO_3$ .

## Codeine Phosphate

$C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  406.37

Morphinan-6-ol, 7,8-didehydro-4,5-epoxy-3-methoxy-17-methyl-, (5 $\alpha$ ,6 $\alpha$ )-, phosphate (1:1) (salt), hemihydrate. 7,8-Didehydro-4,5 $\alpha$ -epoxy-3-methoxy-17-methylmorphinan-6 $\alpha$ -ol phosphate (1:1) (salt) hemihydrate [41444-62-6]. Anhydrous 397.37 [52-28-8].

» Codeine Phosphate contains not less than 99.0 percent and not more than 101.5 percent of  $C_{18}H_{21}NO_3 \cdot H_3PO_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store up to 40° as permitted by the manufacturer.

### USP Reference standards (11)—

USP Codeine Phosphate RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** Neutralize a solution (1 in 50) with 6 N ammonium hydroxide, and add silver nitrate TS: a yellow precipitate of silver phosphate is formed, and it is soluble in 2 N nitric acid and in 6 N ammonium hydroxide.

**Acidity**—Dissolve 100 mg in 20 mL of water, and titrate with 0.010 N sodium hydroxide to a pH of 5.4, using a pH meter: not more than 1.0 mL of 0.010 N sodium hydroxide is required.

**Water**, *Method I* (921): not more than 3.0%.

**Chloride**—To 10 mL of a solution (1 in 100), acidified with nitric acid, add a few drops of silver nitrate TS: no opalescence is produced immediately.

**Sulfate**—To 10 mL of a solution (1 in 100) add a few drops of barium chloride TS: no turbidity is produced immediately.

**Limit of morphine**—Dissolve about 50 mg of potassium ferricyanide in 10 mL of water, and add 1 drop of ferric chloride TS and 1 mL of a solution of Codeine Phosphate (1 in 100): no blue color is produced immediately.

**Chromatographic purity**—Using Codeine Phosphate, proceed as directed in the test for *Chromatographic purity* under *Codeine*, except to use a mixture of 0.01 N hydrochloric acid and dehydrated alcohol (4:1), instead of dehydrated alcohol, to prepare *Solution A*, *Solution B*, and *Solution C*.

**Assay**—Dissolve about 1 g of Codeine Phosphate, accurately weighed, in 50 mL of glacial acetic acid, warming slightly if necessary to effect solution, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 39.74 mg of  $C_{18}H_{21}NO_3 \cdot H_3PO_4$ .

## Codeine Phosphate Injection

» Codeine Phosphate Injection is a sterile solution of Codeine Phosphate in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ .

NOTE—Do not use the Injection if it is more than slightly discolored or contains a precipitate.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

### USP Reference standards (11)—

USP Codeine Phosphate RS

USP Endotoxin RS

### Identification—

**A:** Dilute a volume of Injection, equivalent to about 90 mg of codeine phosphate, with water to about 10 mL, add 1 drop of hydrochloric acid, and extract with three 10-mL portions of chloroform, discarding the chloroform extracts. Add 6 N ammonium hydroxide until the solution is alkaline, and extract with several 10-mL portions of chloroform. Evaporate the combined chloroform extracts on a steam bath to dryness, and dry at 80° for 4 hours: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima at the same wavelengths as that of the codeine obtained by similarly treating 1 mL of a solution of USP Codeine Phosphate RS (1 in 100).

**B:** A volume of Injection, equivalent to about 60 mg of codeine phosphate, responds to *Identification test B* under *Codeine Phosphate*.

**Bacterial endotoxins** (85)—It contains not more than 5.8 USP Endotoxin Units per mg of codeine phosphate.

**pH** (791): between 3.0 and 6.0.

**Limit of morphine**—Diluted with water to a concentration of 5 mg of codeine phosphate per mL, it meets the requirements of the test for *Limit of morphine* under *Codeine Phosphate*.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, equivalent to about 75 mg of codeine phosphate, to a small separator, and add about 15 mL of water. Add 2 drops of phosphoric acid, and extract with four 10-mL portions of chloroform, collecting the chloroform extracts in a separator. Wash the combined chloroform extracts with 10 mL of water, and add the water wash to the first separator containing the sample. Discard the chloroform extracts. Proceed as directed in the *Assay* under *Codeine Phosphate Tablets*, beginning with "render the solution alkaline with 6 N ammonium hydroxide." Each mL of 0.02 N sulfuric acid is equivalent to 8.128 mg of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ .

### Add the following:

## ▲Codeine Phosphate Oral Solution

### DEFINITION

Codeine Phosphate Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ).

Prepare Codeine Phosphate Oral Solution 3 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Codeine Phosphate	300 mg
Purified Water	1.3 mL
Vehicle: Ora-Sweet <sup>a</sup> , a sufficient quantity to make	100 mL

<sup>a</sup>Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place *Codeine Phosphate* powder in a suitable calibrated container. Add *Purified Water* and mix to dissolve. Add the *Ora-Sweet* to bring to final volume, and mix well.

**ASSAY****• PROCEDURE**

**Buffer:** 25 mM monobasic potassium phosphate adjusted with phosphoric acid to a pH of 2.5

**Mobile phase:** Methanol and *Buffer* (30:70). Filter and degas.

**Internal standard solution:** 0.5 mg/mL of theophylline

**Standard stock solution:** 1.0 mg/mL of USP Codeine Phosphate RS

**Standard solution:** Pipet 0.5 mL of the *Standard stock solution* into a 100-mL volumetric flask, add 0.6 mL of the *Internal standard solution*, dilute with water to volume, and pass through a membrane filter of 0.2-μm pore size to obtain a solution with nominal concentrations of 5 μg/mL of codeine phosphate and 3 μg/mL of theophylline.

**Sample solution:** Shake the Oral Solution thoroughly by hand. Transfer 2 mL of Oral Solution from each bottle into a 50-mL volumetric flask, and dilute with water to volume. Transfer 4.17 mL of the diluted sample to a 100-mL volumetric flask, add 0.6 mL of *Internal standard solution*, dilute with water to volume, and filter to obtain a solution with nominal concentrations of 5 μg/mL of codeine phosphate and 3 μg/mL of theophylline.

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 210 nm

**Column:** 4.6-mm × 10-cm; 5-μm packing L1

**Flow rate:** 1.0 mL/min

**Injection volume:** 10 μL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention times for codeine phosphate and theophylline are about 1.9 and 3.8 min, respectively.]

**Suitability requirements**

**Relative standard deviation:** NMT 2.0% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of codeine phosphate ( $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ ) in the portion of Oral Solution taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of codeine phosphate to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of codeine phosphate to the internal standard from the *Standard solution*

$C_S$  = concentration of codeine phosphate in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of codeine phosphate in the *Sample solution* (μg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS****• pH <791>:** 3.7–4.7**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature.

**• LABELING:** Label it to indicate the *Beyond-Use Date*, and that it is to be well-shaken before use.

**• BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded, when stored at controlled room temperature

**• USP REFERENCE STANDARDS <11>**

USP Codeine Phosphate RS▲<sub>USP36</sub>

**Codeine Phosphate Tablets**

» Codeine Phosphate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards <11>—**

USP Codeine Phosphate RS

**Identification—**

**A:** Digest a quantity of finely powdered Tablets, equivalent to about 100 mg of codeine phosphate, with 15 mL of water and 5 mL of 2 N sulfuric acid for 1 hour. Filter, if necessary, and wash any undissolved residue with a few mL of water. Render the filtrate alkaline with 6 N ammonium hydroxide, extract with several small portions of chloroform, and proceed as directed in *Identification* test A under *Codeine Phosphate Injection*, beginning with “Evaporate the combined chloroform extracts.” The specified results are observed.

**B:** To a quantity of finely powdered Tablets, equivalent to about 100 mg of codeine phosphate, add 10 mL of water and 2 drops of 2 N sulfuric acid. Digest, with frequent shaking, for 15 minutes, and filter. Neutralize 5 mL of the filtrate with 6 N ammonium hydroxide, and add silver nitrate TS: a yellow precipitate of silver phosphate is formed, and it is soluble in diluted nitric acid and in 6 N ammonium hydroxide.

**Dissolution <711>—**

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Codeine Phosphate RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  is dissolved in 45 minutes.

**Uniformity of dosage units <905>:** meet the requirements.

**Procedure for content uniformity**—Transfer 1 Tablet, previously crushed or finely powdered, to a 50-mL volumetric flask, add 25 mL of water, and shake to dissolve. Dilute with water to volume, and filter, if necessary, discarding the first 20 mL of the filtrate. Transfer an aliquot of the filtrate, equivalent to about 6 mg of codeine phosphate, to a 50-mL volumetric flask containing 2 mL of 3 N hydrochloric acid, and dilute with water to volume. Dissolve an accurately weighed quantity of USP Codeine Phosphate RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 120 μg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 284 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$  in the Tablet taken by the formula:

$$2.5(C/V)(A_U/A_S)(406.37/397.37)$$

in which C is the concentration, in μg per mL, of USP Codeine Phosphate RS in the Standard solution; V is the volume, in mL, of the aliquot taken of the solution of the Tablet;  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively; and 406.37

and 397.37 are the molecular weights of codeine phosphate hemihydrate and anhydrous codeine phosphate, respectively.

**Limit of morphine**—A 1-mL portion of the filtrate from Identification test B meets the requirements of the test for Limit of morphine under Codeine Phosphate.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Accurately weigh a portion of the powder, equivalent to about 150 mg of codeine phosphate, and transfer to a 100-mL volumetric flask. Add 20 mL of 0.5 N sulfuric acid, and shake the mixture occasionally during 2 hours. Add water to volume, mix, and filter through a filtering crucible. Transfer to a separator an accurately measured portion of the filtrate, equivalent to not less than 75 mg of codeine phosphate, render the solution alkaline with 6 N ammonium hydroxide, and completely extract the alkaloid with successive 15-mL portions of chloroform. Evaporate the combined chloroform solution on a steam bath nearly to dryness. Dissolve the residue in about 2 mL of methanol, heating, if necessary, add methyl red TS, and titrate with 0.02 N sulfuric acid VS to a faint pink color. Add about 40 mL of freshly boiled, cooled water, and complete the titration with 0.02 N sulfuric acid VS. Each mL of 0.02 N sulfuric acid is equivalent to 8.128 mg of  $C_{18}H_{21}NO_3 \cdot H_3PO_4 \cdot \frac{1}{2}H_2O$ .

## Codeine Sulfate

$(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4 \cdot 3H_2O$  750.85

$(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4$  696.82

Morphinan-6-ol, 7,8-didehydro-4,5-epoxy-3-methoxy-17-methyl-, (5 $\alpha$ ,6 $\alpha$ )-, sulfate (2:1) (salt), trihydrate; 7,8-Didehydro-4,5 $\alpha$ -epoxy-3-methoxy-17-methylmorphinan-6 $\alpha$ -ol sulfate (2:1) (salt) trihydrate [6854-40-6]. Anhydrous [1420-53-7].

### DEFINITION

Codeine Sulfate, dried at 105° for 3 h, contains NLT 98.0% and NMT 102.0% of  $(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4$ .

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B. ULTRAVIOLET ABSORPTION** (197U)
 

Sample solution: 100  $\mu$ g/mL in water

Acceptance criteria: Absorptivities at 284 nm do not differ by more than 3.0%, calculated on the dried basis.
- **C. IDENTIFICATION TESTS—GENERAL, Sulfate** (191): Meets the requirements

### ASSAY

#### PROCEDURE

**Buffer:** Dissolve 4.0 g of potassium phosphate monobasic in 2000 mL of water, and adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ .

**Solution A:** 5 mM sodium heptane sulfonate in methanol and Buffer (3:7). [NOTE—Dissolve 1.0 g sodium heptane sulfonate for each L of Mobile phase produced, and filter.]

**Solution B:** 5 mM sodium heptane sulfonate in methanol and Buffer (11:9). [NOTE—Dissolve 1.0 g sodium heptane sulfonate for each L of Mobile phase produced, and filter.]

**Diluent:** Solution A

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
16	0	100
16.5	100	0
24	100	0

**Standard solution:** 1 mg/mL of USP Codeine Sulfate RS in Diluent

**Sample solution:** 1 mg/mL of Codeine Sulfate in Diluent

### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 280 nm

**Column:** 4.6-mm  $\times$  25-cm; 5- $\mu$ m packing L1

**Column temperature:** 40°

**Flow rate:** 1.0 mL/min

**Injection size:** 20  $\mu$ L

### System suitability

**Sample:** Standard solution

### Suitability requirements

**Tailing factor:** NMT 2.0

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of codeine sulfate

$[(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4]$  in the portion of Codeine Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak area of codeine sulfate from the Sample solution

$r_S$  = peak area of codeine sulfate from the Standard solution

$C_S$  = concentration of USP Codeine Sulfate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Codeine Sulfate in the Sample solution (mg/mL)

**Acceptance criteria:** 98.0%–102.0%

## IMPURITIES

### Inorganic Impurities

- **RESIDUE ON IGNITION** (281): NMT 0.1%

### Organic Impurities

#### PROCEDURE 1

**Buffer, Solution A, Solution B, Diluent, Mobile phase, and Chromatographic system:** Proceed as directed in the Assay.

**Standard stock solution:** 1 mg/mL of USP Codeine Sulfate RS in Diluent

**Standard solution:** 0.01 mg/mL of USP Codeine Sulfate RS in Diluent from Standard stock solution

**Sensitivity solution:** 0.5  $\mu$ g/mL of USP Codeine Sulfate RS in Diluent from Standard stock solution

**Sample solution:** 1 mg/mL of Codeine Sulfate in Diluent

### System suitability

**Samples:** Standard solution and Sensitivity solution

### Suitability requirements

**Tailing factor:** NLT 0.5 and NMT 1.5, Standard solution

**Relative standard deviation:** NMT 5.0%, Standard solution

**Signal-to-noise ratio:** NLT 10, Sensitivity solution

### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of each individual impurity in the portion of Codeine Sulfate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each individual impurity from the Sample solution

$r_S$  = peak response of codeine sulfate from the Standard solution

$C_S$  = concentration of USP Codeine Sulfate RS in the Standard solution (mg/mL)

$C_U$  = concentration of Codeine Sulfate in the Sample solution (mg/mL)

$F$  = relative response factor of the related compounds (see Impurity Table 1)

**Acceptance criteria**Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 1.5%.

**Impurity Table 1**

 $r_U$  = peak area of codeine sulfate from the *Sample solution* $r_S$  = peak area of codeine sulfate from the *Standard solution* $C_S$  = concentration of USP Codeine Sulfate RS in the *Standard solution* (mg/mL)

- $C_U$  = concentration of codeine sulfate in the *Sample solution* (mg/mL)  
 $M_{r1}$  = molecular weight of codeine sulfate, trihydrate, 750.87  
 $M_{r2}$  = molecular weight of codeine sulfate, anhydrous, 696.82

Acceptance criteria: 93.0%–107.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

Medium: Water; 500 mL

Apparatus 2: 25 rpm

Time: 45 min

Detector: UV, maxima at about 284 nm

Cell: 1 cm

Blank: *Medium*

Standard solution: USP Codeine Sulfate RS in *Medium*

Sample solution: Pass a portion of the solution under test through a suitable filter of 0.8- $\mu$ m pore size.

Tolerances: NLT 75% (Q) of the labeled amount of  $(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4 \cdot 3H_2O$  is dissolved.

### • UNIFORMITY OF DOSAGE UNITS <905>

Procedure for content uniformity

Standard solution: 110  $\mu$ g/mL of USP Codeine Sulfate RS in 0.2 N sulfuric acid

Sample solution: Transfer 1 Tablet to a 50-mL volumetric flask. Add 20 mL of 0.5 N sulfuric acid and 10 mL of water. Shake until the Tablet is disintegrated, and allow to stand for 16 h. Dilute with water to volume, and filter, discarding the first few mL of the filtrate. Dilute the resulting filtrate with 0.2 N sulfuric acid to obtain a solution containing nominally 120  $\mu$ g/mL of codeine sulfate (trihydrate).

Spectrometric conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

Mode: UV-Vis

Analytical wavelength: About 284 nm

Cell: 1 cm

Blank: 0.2 N sulfuric acid

Analysis

Samples: *Standard solution*, *Sample solution*, and *Blank*  
 Calculate the percentage of  $(C_{18}H_{21}NO_3)_2 \cdot H_2SO_4 \cdot 3H_2O$  in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times (M_{r1}/M_{r2}) \times 100$$

- $A_U$  = absorbance of the *Sample solution*  
 $A_S$  = absorbance of the *Standard solution*  
 $C_S$  = concentration of USP Codeine Sulfate RS in the *Standard solution* ( $\mu$ g/mL)  
 $C_U$  = nominal concentration of codeine sulfate trihydrate in the *Sample solution* ( $\mu$ g/mL)  
 $M_{r1}$  = molecular weight of codeine sulfate trihydrate, 750.87  
 $M_{r2}$  = molecular weight of anhydrous codeine sulfate, 696.82

Acceptance criteria: Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

Diluent, Solution A, Solution B, Mobile phase, Standard solution, Sensitivity solution, Sample solution, Chromatographic system, and System suitability: Proceed as directed in the *Assay*.

Analysis

Samples: *Standard solution* and *Sample solution*  
 Calculate the percentage of each individual impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

- $r_U$  = peak response of each individual impurity from the *Sample solution*  
 $r_S$  = peak response of codeine sulfate from the *Standard solution*

- $C_S$  = concentration of USP Codeine Sulfate RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of codeine sulfate in the *Sample solution* (mg/mL)  
 $F$  = relative response factor of the related compounds (see *Impurity Table 1*)

### Acceptance criteria

Individual impurities: See *Impurity Table 1*.

Total impurities: NMT 0.5%

Impurity Table 1

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Codeine-N-oxide <sup>a</sup>	0.39	1.25	0.2
Codeine sulfate	1.00	—	—
Codeinone <sup>b</sup>	1.10	1.0	0.3
Individual unspecified degradant	—	—	0.2

<sup>a</sup> 7,8-Didehydro-4,5 $\alpha$ -epoxy-3-methoxy-17-methylmorphinan-6 $\alpha$ -ol N-oxide.

<sup>b</sup> 7,8-Didehydro-4,5 $\alpha$ -epoxy-3-methoxy-17-methylmorphinan-6 $\alpha$ -one.

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS <11>**  
 USP Codeine Sulfate RS

## Colchicine

$C_{22}H_{25}NO_6$  399.44

Acetamide, N-(5,6,7,9-tetrahydro-1,2,3,10-tetramethoxy-9-oxobenzo[a]heptalen-7-yl)-, (S)-.

Colchicine [64-86-8].

» Colchicine is an alkaloid contained in various species of *Colchicum* and in other genera. It contains not less than 94.0 percent and not more than 101.0 percent of  $C_{22}H_{25}NO_6$ , calculated on the anhydrous, solvent-free basis.

*Caution—Colchicine is extremely poisonous.*

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards <11>**—

USP Colchicine RS

**Identification, Infrared Absorption <197K>**—[NOTE—Disregard any peak occurring at 1735  $cm^{-1}$ .]

**Specific rotation <781S>**: between  $-240^\circ$  and  $-250^\circ$ , calculated on the anhydrous, solvent-free basis.

*Test solution*: 10 mg per mL, in alcohol.

**Water, Method I <921>**: not more than 2.0%.

**Limit of colchicine**—To 5 mL of a solution (1 in 100) add 2 drops of ferric chloride TS: no definite green color is produced.

**Limit of ethyl acetate—**

*Internal standard solution*—Dilute 0.5 mL of *n*-propyl alcohol with water to 100.0 mL.

*Standard solution*—Pipet 1 mL of ethyl acetate and 0.5 mL of *n*-propyl alcohol into a 1000-mL volumetric flask, add water to volume, and mix. Each mL of *Standard solution* contains 0.90 mg of ethyl acetate.

*Test solution*—Place about 250 mg of Colchicine, accurately weighed, in a 10-mL volumetric flask, dissolve in about 8 mL of water, and add 1.0 mL of *Internal standard solution*. Add water to volume, and mix.

*Procedure*—Determine appropriate sensitivity settings on a gas chromatograph (see *Chromatography* (621)) fitted with a 4-mm × 1.5-m column packed with 20% (w/v) phase G14 on support S1, maintaining the column temperature at 75°, using nitrogen as the carrier gas, and using a flame-ionization detector. Inject the *Standard solution* and the *Test solution*, determine the peak height for ethyl acetate relative to the peak height for *n*-propyl alcohol, and calculate the percentage, by weight, of ethyl acetate in the portion of Colchicine taken: not more than 8.0% is found.

**Chromatographic purity**—The sum of the responses of any peaks other than that due to colchicine, eluting within 1.5 times the retention time for colchicine, is not more than 5.0% of the sum of all responses, obtained as directed in the *Assay*.

**Residual solvents** (467): meets the requirements, except that the limit of chloroform is 100 ppm.

**Assay**—[NOTE—Perform all dilutions in low-actinic glassware.]

*Mobile phase*—Dilute 45 mL of 0.5 M monobasic potassium phosphate with water to 450 mL. Add about 530 mL of methanol, cool to room temperature, and add methanol to bring the volume to 1000 mL. Adjust with 0.5 M phosphoric acid to a pH of 5.5 ± 0.05, and pass through a 0.45-μm membrane filter.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Colchicine RS in a mixture of methanol and water (1:1), and dilute quantitatively and stepwise with the same mixture to obtain a solution having a known concentration of about 6 μg per mL. This solution is stable for 4 months when stored tightly stoppered and in the dark.

*Assay preparation*—[NOTE—Prepare immediately before use.] Transfer about 60 mg of Colchicine, accurately weighed, to a 500-mL volumetric flask, dissolve in a mixture of methanol and water (1:1), dilute with the same mixture to volume, and mix. Pipet 5 mL of this solution into a 100-mL volumetric flask, dilute with the same mixture to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 4500 theoretical plates, the retention time for colchicine is between 5.5 and 9.5 minutes, and the relative standard deviation for replicate injections is not more than 2%.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for all peaks recorded during 1.5 times the retention time for colchicine. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>25</sub>NO<sub>6</sub> in the Colchicine taken by the formula:

$$10C(r_U / r_S)$$

in which *C* is the concentration, in μg per mL, of the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the colchicine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Colchicine Injection**

---

» Colchicine Injection is a sterile solution of C<sub>22</sub>H<sub>25</sub>NO<sub>6</sub> in Water for Injection, prepared from Colchicine with the aid of Sodium Hydroxide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>22</sub>H<sub>25</sub>NO<sub>6</sub>.

*Caution*—Colchicine is extremely poisonous.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Colchicine RS

USP Endotoxin RS

**Identification**—

**A:** Transfer a volume of Injection, equivalent to about 2 mg of colchicine, to a separator. Add 5 mL of water, and extract with 15 mL of chloroform. Evaporate the chloroform extract, using mild heat, to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Colchicine RS.

**B:** The UV absorption spectrum of the Injection, diluted with water to a concentration of about 10 μg of colchicine per mL, exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Colchicine RS, concomitantly measured.

**Bacterial endotoxins** (85)—It contains not more than 166.7 USP Endotoxin Units per mg of colchicine.

**pH** (791): between 6.0 and 7.2, in a solution of Injection containing 1.0 mg of potassium chloride in each mL.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—[NOTE—Perform all dilutions in low-actinic glassware.]

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under Colchicine.

*Assay preparation*—[NOTE—Prepare immediately before use.] Transfer an accurately measured volume, *V* mL, of Injection, equivalent to about 1 mg of colchicine, to a 50-mL volumetric flask, dilute with a mixture of methanol and water (1:1) to volume, and mix. Pipet 30 mL of this solution into a 100-mL volumetric flask, dilute with the same mixture to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under Colchicine, and measure the responses for the colchicine peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>25</sub>NO<sub>6</sub> in each mL of the Injection taken by the formula:

$$(C / 6V)(r_U / r_S)$$

in which *C* is the concentration, in μg per mL, of the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Colchicine Tablets**

---

» Colchicine Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>22</sub>H<sub>25</sub>NO<sub>6</sub>.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Colchicine RS

**Identification**—Weigh a portion of ground Tablets, equivalent to about 20 mg of colchicine, triturate with 20 mL of water, allow the solids to settle, and filter the supernatant into a separator. Extract with 30 mL of chloroform. Evaporate the chloroform extract, using mild heat, to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue so obtained exhibits maxima only at the same wavelengths as that of a similar preparation of USP Colchicine RS.

**Dissolution**, *Procedure for a Pooled Sample* (711)—[NOTE—Conduct this procedure without delay, under subdued light, and using low-actinic glassware.]

Medium: water; 500 mL.

Apparatus 1: 100 rpm.

Time: 30 minutes.

*Procedure*—Determine the amount of  $C_{22}H_{25}NO_6$  dissolved, employing the procedure set forth in the *Assay* under *Colchicine*, making any necessary modifications.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{22}H_{25}NO_6$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—[NOTE—Perform all dilutions in low-actinic glassware.]

*Mobile phase*, *Standard preparation*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Colchicine*.

*Assay preparation*—[NOTE—Prepare immediately before use.] Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 0.6 mg of colchicine, to a 100-mL volumetric flask, add about 50 mL of a mixture of methanol and water (1:1), and shake by mechanical means for 15 minutes, rinsing down the walls of the flask at about 8 minutes. Dilute with the same mixture to volume, and pass through a 0.45- $\mu$ m membrane filter.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Colchicine*, and measure the responses for the colchicine peaks. Calculate the quantity, in mg, of  $C_{22}H_{25}NO_6$  in the portion of Tablets taken by the formula:

$$0.1 C(r_U / r_S)$$

in which C is the concentration, in  $\mu$ g per mL, of the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Colestipol Hydrochloride

» Colestipol Hydrochloride is an insoluble, high molecular weight basic anion-exchange copolymer of diethylenetriamine and 1-chloro-2,3-epoxypropane with approximately one out of five amino nitrogens protonated. Each g binds not less than 1.1 mEq and not more than 1.6 mEq of sodium cholate, calculated as cholate binding capacity.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Colestipol Hydrochloride RS

**Identification**—*Infrared Absorption* (197K)—Prepare the test specimen and the Standard specimen by mixing about 3 to 4 mg of Colestipol Hydrochloride and of USP Colestipol

Hydrochloride RS, respectively, with about 150 mg of potassium bromide.

**pH** (791)—Prepare a 10% (w/w) suspension of it in deionized water in a clean vial. Insert the stopper, shake at approximately 10-minute intervals for 1 hour, and centrifuge. Transfer a portion of the clear supernatant to a suitable container, and record the pH as soon as the reading has stabilized: the pH is between 6.0 and 7.5.

**Loss on drying** (731)—Dry it in vacuum at a pressure of about 5 mm of mercury at 75° for 16 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.3%.

**Heavy metals**, *Method II* (231): not more than 0.002%.

**Content of chloride**—

*Test preparation*—Using about 20 mg of Colestipol Hydrochloride, accurately weighed, proceed as directed under *Oxygen Flask Combustion* (471), 10 mL of 0.05 N sodium hydroxide being used as the absorbing liquid. Do not allow the paper specimen wrapper to come in contact with the liquid, and ignite the paper with an IR igniter. After combustion is complete, shake the flask vigorously, and allow to stand, with frequent shaking, for about 40 minutes or until no cloudiness is present. Transfer the solution to a 50-mL beaker. Wash the flask with two 5-mL portions of water and two 10-mL portions of alcohol, adding each washing to the beaker, and add 0.2 mL of nitric acid.

*Reagent blank preparation*—Using a paper specimen wrapper, complete the combustion, and allow the mixture to stand for about 40 minutes or until no cloudiness is present, as directed under *Test preparation*. Transfer the solution so obtained to a 50-mL beaker. Wash the combustion flask with two 5-mL portions of water and two 10-mL portions of alcohol, adding the washings to the beaker, and add 0.2 mL of nitric acid.

*Procedure*—Titrate the *Test preparation* and the *Reagent blank preparation* with 0.05 N silver nitrate VS, determining the endpoint potentiometrically, using a silver-silver chloride electrode and a glass reference electrode (see *Titrimetry* (541)). Determine the volume of 0.05 N silver nitrate VS consumed by the test specimen taken by the formula:

$$V - V_B$$

in which V and  $V_B$  are the volumes, in mL, of titrant used for the *Test preparation* and the *Reagent blank preparation*, respectively. Each mL of 0.05 N silver nitrate is equivalent to 1.773 mg of Cl: the chloride content is between 6.5% and 9.0%, calculated on the dried basis.

**Water absorption**—Transfer about 5 g of Colestipol Hydrochloride, accurately weighed, to a dry, 100-mL plastic container, and add about 80 g of water, accurately weighed. Cover the container, and allow the suspension to equilibrate for 72 hours. With the aid of vacuum, filter the slurry transferred to a medium-porosity, fritted-glass funnel, and collect the filtrate in a tared plastic container. Disconnect the vacuum 2 minutes after the collection of the last portion of the filtrate. Weigh the container and the filtrate, and determine the weight, in g, of the filtrate. Determine the amount of water absorbed by subtracting the weight of the filtrate from the weight of water taken for the test, and divide the weight, in g, of the absorbed water by the weight, in g, of Colestipol Hydrochloride taken: each g absorbs between 3.3 g and 5.3 g of water.

**Cholate binding capacity**—

*Cholate solution*—Dissolve accurately weighed quantities of sodium cholate and sodium chloride in water, and quantitatively dilute with water to obtain a solution having known concentrations of 10.0 mg of sodium cholate per mL and 9.0 mg of sodium chloride per mL. Adjust the solution by the dropwise addition of hydrochloric acid to a pH of 6.4  $\pm$  0.1.

**Test preparation**—Transfer  $1.0 \pm 0.01$  g of Colestipol Hydrochloride to a glass-stoppered, 125-mL conical flask. Add 100.0 mL of *Cholate solution*, insert the stopper securely in the flask, shake vigorously for 90 minutes with the flask positioned horizontally on a platform shaker, remove the flask from the shaker, and allow the solids to settle for 5 minutes.

**Procedure**—Transfer 20.0 mL of supernatant from the *Test preparation* to a 40-mL beaker, transfer 20.0 mL of *Cholate solution* to a second 40-mL beaker, and adjust both solutions by the dropwise addition of 1 N sodium hydroxide to a pH of  $10.5 \pm 0.5$ . Titrate both solutions with 0.1 N hydrochloric acid VS, determining the endpoints potentiometrically, and measure the titrant volume corresponding to the difference between the midpoints of the two inflections in the titration curves obtained for each solution (see *Titrimetry* (541)). Determine the volume of titrant equivalent to the bound cholate by subtracting the volume of 0.1 N hydrochloric acid VS used in titrating the *Test preparation* from that used in titrating the *Cholate solution*. Calculate the *Cholate binding capacity*, in mEq per g, taken by the formula:

$$5VN / W$$

in which  $V$  is the volume, in mL, of titrant equivalent to the bound cholate;  $N$  is the normality of the 0.1 N hydrochloric acid VS; and  $W$  is the weight, in g, of Colestipol Hydrochloride taken for the *Test preparation*. The *Cholate binding capacity* is between 1.1 mEq per g and 1.6 mEq per g.

**Water-soluble substances**—Transfer 5.0 g of Colestipol Hydrochloride, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 80.0 mL of water, insert the stopper in the flask, and mount the flask in a water-bath shaker maintained at  $37 \pm 1^\circ$ . Operate the shaker for 72 hours, remove the flask from the shaker, and filter the contents twice—first through a premoistened 0.45- $\mu$ m nylon membrane filter and then through a 0.45- $\mu$ m PVDF filter, collecting the filtrate in a tared 125-mL conical flask. Rinse any residual test material in the flask with two 5-mL portions of water, pass the washings through the filters, and combine the filtrates from the washings with the filtrate from the test mixture. Evaporate the filtrate to dryness, filtered air or nitrogen being used, if necessary, to aid in the evaporation. Dry the residue in a vacuum oven maintained at  $75^\circ$  for 1 hour, allow to cool in a desiccator, and weigh: not more than 0.5% of water-soluble substances is found in the portion of Colestipol Hydrochloride taken.

#### Colestipol exchange capacity—

**Resin base preparation**—Combine not less than 2 g of Colestipol Hydrochloride and 100 mL of 1 N sodium hydroxide in a 125-mL conical flask, insert a stopper in the flask, secure the flask on a platform shaker, and shake the mixture for 3 to 4 hours. Filter the suspension through a coarse-porosity, fritted-glass funnel, and wash the resin with 500 mL of water. Transfer the resin to a 1000-mL beaker, add 200 mL of water, allow to stand for 10 minutes, filter the suspension, and check the pH of the filtrate. Repeat the washing procedure with 200-mL portions of water until the pH of the filtrate is below 8 (as much as 5000 mL of water may be required). Dry the colestipol base resin so obtained and the funnel at a pressure of about 5 mm of mercury at  $60^\circ$  for 16 hours. Break up any aggregates, and store the *Resin base preparation* in a desiccator.

**Procedure**—Transfer about 1.0 g of the *Resin base preparation* to a 125-mL conical flask, add 100.0 mL of 0.20 N hydrochloric acid, insert a stopper in the flask, and shake the mixture by mechanical means for 2.5 hours. Filter a portion of the suspension through a pledget of glass wool, and transfer 8.0 mL of the filtrate (*test preparation*) to a 25-mL beaker. Transfer 5.0 mL of the same 0.20 N hydrochloric acid that was used to equilibrate the resin to a second 25-mL beaker, and add 5.0 mL of water. Titrate both solutions with 0.2 N sodium hydroxide VS, determining the endpoints potentiometrically (see *Titrimetry* (541)), and cal-

culate the *Colestipol exchange capacity*, in mEq per g, taken by the formula:

$$(100N / W)[(V_b / 5) - (V_a / 8)]$$

in which  $N$  is the normality of the sodium hydroxide VS;  $W$  is the weight, in g, of the *Resin base preparation* taken;  $V_b$  is the volume, in mL, of titrant used to neutralize the 5.0-mL aliquot of 0.20 N hydrochloric acid; and  $V_a$  is the volume, in mL, of titrant used to neutralize the residual acid in the test preparation. Each g exchanges not less than 9.0 mEq and not more than 11.0 mEq of sodium hydroxide, calculated as colestipol exchange capacity.

## Colestipol Hydrochloride for Oral Suspension

» Colestipol Hydrochloride for Oral Suspension is a mixture of Colestipol Hydrochloride with a suitable flow-promoting agent. Each g binds not less than 1.1 mEq and not more than 1.6 mEq of sodium cholate, calculated as the cholate binding capacity.

**Packaging and storage**—Preserve in tight, single-dose or multiple-dose containers.

**USP Reference standards** (11)—

USP Colestipol Hydrochloride RS

**Identification, Infrared Absorption** (197K)—Prepare the test specimen and the Standard specimen by mixing about 5 mg of Colestipol Hydrochloride for Oral Suspension and 5 mg of USP Colestipol Hydrochloride RS, respectively, with about 100 to 125 mg of potassium bromide.

**Minimum fill** (755): meets the requirements for powders.

**Water-soluble substances**—Transfer 5.0 g of Colestipol Hydrochloride for Oral Suspension, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 80.0 mL of water, insert the stopper in the flask, and mount the flask in a water-bath shaker maintained at  $37 \pm 1^\circ$ . Operate the shaker for 72 hours, remove the flask from the shaker, and filter the contents twice—first through a premoistened 0.45- $\mu$ m nylon membrane filter and then through a 0.45- $\mu$ m PVDF filter, collecting the filtrate in a tared 100-mL fused quartz crucible. Rinse any residual test material in the flask with two 5-mL portions of water, pass the washings through the filters, and combine the filtrates from the washings with the filtrate from the test mixture. Evaporate the filtrate to dryness, filtered air or nitrogen being used, if necessary, to aid in the evaporation. Dry the residue in a vacuum oven maintained at  $75^\circ$  for 1 hour, allow to cool in a desiccator, and weigh. Calculate the initial percentage of water-soluble substances in the portion of Colestipol Hydrochloride for Oral Suspension taken. Again heat the residue in a muffle furnace maintained at  $800 \pm 25^\circ$  for 4 hours, allow to cool in a desiccator, and weigh. Calculate the percentage of inert ingredients present. Calculate the actual percentage of water-soluble substances in the portion of Colestipol Hydrochloride for Oral Suspension taken by subtracting the percentage of inert ingredients from the initial percentage of water-soluble substances found. Not more than 0.5% of water-soluble substances is found.

**Other requirements**: meets the requirements of the tests for *Cholate binding capacity* and *pH* under *Colestipol Hydrochloride*.

## Colestipol Hydrochloride Tablets

» Colestipol Hydrochloride Tablets contain Colestipol Hydrochloride. Each Tablet binds not less than 1.1 mEq and not more than 1.6 mEq of sodium cholate per g of the labeled amount of colestipol hydrochloride, calculated as cholate binding capacity.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Colestipol Hydrochloride RS

**Identification**, *Infrared Absorption* (197K)—

**Test specimen**—Completely remove the coating film from a Tablet with a suitable implement, and grind the contents into fine powder. To about 30 to 40 mg of the powder, add about 15 mL of methanol, shake vigorously for 3 minutes, then sonicate for 10 minutes, and shake for another 3 minutes. Pass through a suitable paper filter, wash the residue 3 times, each time with 10 mL of methanol. [NOTE—A qualitative paper filter, with a coarse porosity and a particle retention 20–25  $\mu\text{m}$ , is suitable.] Dry the residue at 60° in vacuum for 2 hours. Mix about 4 mg of the dried sample with about 150 mg of potassium bromide.

**Standard specimen**—Mix about 3 to 4 mg of USP Colestipol Hydrochloride RS with about 150 mg of potassium bromide.

**Uniformity of dosage units**—

*Sodium chloride solution, Cholate solution, 0.09 M Buffer solution pH 2.5, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the test for *Cholate binding capacity*.

**Test solution**—Transfer 1 Tablet to a 100-mL volumetric flask, dilute with *Cholate solution* to volume, and stir for 120 minutes. Let the sample settle down for at least 10 minutes, and filter a portion using a 0.45- $\mu\text{m}$  PVDF filter, discarding the first 5 mL of the filtrate.

**Procedure**—Proceed as directed in the test for *Cholate binding capacity*, except to inject the *Test solution* instead of the *Test preparation*.

Select not fewer than 30 Tablets. Test 10 Tablets individually as directed above. The requirements are met if the cholate binding capacity in each of the 10 Tablets lies within the range of 1.15 to 1.55 mEq per g of the labeled amount of colestipol hydrochloride, and the relative standard deviation is not more than 6.0%.

If 1 Tablet is outside the range of 1.15 to 1.55 mEq per g and no Tablet is outside the range of 1.01 to 1.69 mEq per g, or if the relative standard deviation is greater than 6.0%, or if both conditions prevail, test 20 additional Tablets. The requirements are met if not more than 1 Tablet of the 30 is outside the range of 1.15 to 1.55 mEq per g and no Tablet is outside the range of 1.01 to 1.69 mEq per g of the labeled amount of colestipol hydrochloride, and the relative standard deviation for 30 Tablets does not exceed 7.8%.

**pH** (791)—Transfer 5 g of ground Tablets to a suitable flask, add 50 mL of deionized water, close the flask with a stopper, and stir for about 30 minutes or until the Tablets completely disintegrate. Centrifuge to obtain a clear supernatant: the pH is between 5.5 and 7.5.

**Cholate binding capacity**—

*0.09 M Buffer solution pH 2.5*—Dissolve 12.5 g of monobasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of  $2.5 \pm 0.05$ .

*Mobile phase*—Prepare a mixture of *0.09 M Buffer solution pH 2.5*, acetonitrile, and methanol (50:36:14), mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Sodium chloride solution*—Prepare a solution in water containing 9.0 mg of sodium chloride per mL.

*Cholate solution*—Transfer an accurately weighed quantity of sodium cholate to a suitable volumetric flask, add *Sodium chloride solution* to about 80% of the final volume, sonicate to dissolve, and dilute with *Sodium chloride solution* to volume to obtain a solution having a known concentration of 10.0 mg of sodium cholate per mL on the anhydrous basis. [NOTE—Determine the water content of sodium cholate titrimetrically at the time of use.] Adjust the solution by the dropwise addition of 0.5 N hydrochloric acid to a pH of  $6.45 \pm 0.05$ . [NOTE—Do not allow the pH to go below 6.40 at any time.] Use this solution as soon as possible after preparation.

**Test preparation**—Transfer 10 Tablets to a glass-stoppered 1.5-L flask. Add 1000.0 mL of *Cholate solution*, insert the stopper securely in the flask, and stir for 120 minutes. Filter a portion using a 0.45- $\mu\text{m}$  PVDF filter, discarding the first 5 mL of the filtrate.

**Standard preparation**—Dilute a portion of the *Cholate solution* with *Sodium chloride solution*, to obtain a solution having a known concentration of about 4.0 mg of sodium cholate per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu\text{m}$  packing L7. The flow rate is about 1.2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates; the tailing is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the concentration of the unbound cholate,  $C_T$ , in the *Test preparation* by the formula:

$$C_S \times (r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of sodium cholate in the *Standard preparation*; and  $r_U$  and  $r_S$  are the cholate peak areas obtained from the *Test preparation* and the *Standard preparation*, respectively. Calculate the cholate binding capacity, in mEq per g of the labeled amount of colestipol hydrochloride, by the formula:

$$(1000 / 430.6)(C_{CH} - C_T) / NL$$

in which 1000 is a conversion coefficient to g; 430.6 is the molecular weight of sodium cholate;  $C_{CH}$  is the concentration, in mg per mL, of sodium cholate in the *Cholate solution*;  $N$  is the number of Tablets taken to prepare the *Test preparation*; and  $L$  is the labeled amount of colestipol hydrochloride, in g per Tablet.

## Colistimethate Sodium

$\text{C}_{58}\text{H}_{105}\text{N}_{16}\text{Na}_5\text{O}_{28}\text{S}_5$  (colistin A component) 1749.82  
 $\text{C}_{57}\text{H}_{103}\text{N}_{16}\text{Na}_5\text{O}_{28}\text{S}_5$  (colistin B component) 1735.79  
 Colistimethate sodium.

Pentasodium colistinmethanesulfonate [8068-28-8; 21362-08-3].

» Colistimethate Sodium has a potency equivalent to not less than 390 µg of colistin per mg.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* ⟨1⟩.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** ⟨11⟩—

USP Colistimethate Sodium RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* ⟨1⟩.

**Identification, Infrared Absorption** ⟨197K⟩.

**pH** ⟨791⟩: between 6.5 and 8.5, in a solution containing 10 mg per mL.

**Loss on drying** ⟨731⟩—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 7.0% of its weight.

**Heavy metals, Method II** ⟨231⟩: not more than 0.003%.

**Free colistin**—Dissolve 80 mg in 3 mL of water, and add 0.05 mL of silicotungstic acid solution (1 in 10): no immediate precipitate is formed.

**Other requirements**—Where the label states that Colistimethate Sodium is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Colistimethate for Injection*. Where the label states that Colistimethate Sodium must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Colistimethate for Injection*.

**Assay**—

**Assay preparation**—Dissolve a suitable quantity of Colistimethate Sodium, accurately weighed, in 2.0 mL of water, add a sufficient accurately measured volume of *Buffer No. 6* to obtain a solution having a convenient concentration.

**Procedure**—Proceed as directed for Colistimethate Sodium under *Antibiotics—Microbial Assays* ⟨81⟩, using an accurately measured volume of *Assay preparation* diluted quantitatively with *Buffer No. 6* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Colistimethate for Injection

» Colistimethate for Injection contains an amount of Colistimethate Sodium equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of colistin.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* ⟨1⟩.

**USP Reference standards** ⟨11⟩—

USP Colistimethate Sodium RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* ⟨1⟩.

**Bacterial endotoxins** ⟨85⟩—It contains not more than 2.0 USP Endotoxin Units per mg of colistin.

**Sterility** ⟨71⟩—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**Other requirements**—It responds to the *Identification* test and meets the requirements for *pH*, *Loss on drying*, *Heavy metals*, and *Free colistin* under *Colistimethate Sodium*. It meets also the requirements for *Uniformity of Dosage Units* ⟨905⟩ and for *Constituted Solutions* and *Labeling* under *Injections* ⟨1⟩.

**Assay**—

**Assay preparation 1** (where it is represented as being in a single-dose container)—Constitute Colistimethate for Injection in a volume of water, accurately measured, corresponding to the volume of diluent specified in the labeling. Withdraw all of the withdrawable contents, using a suitable hypodermic needle and syringe, and quantitatively dilute with *Buffer No. 6* to obtain a solution having a convenient concentration.

**Assay preparation 2** (where the label states the quantity of colistin equivalent in a given volume of constituted solution)—Constitute Colistimethate for Injection in a volume of water, accurately measured, corresponding to the volume of diluent specified in the labeling. Quantitatively dilute an accurately measured volume of the constituted solution with *Buffer No. 6* to obtain a solution having a convenient concentration.

**Procedure**—Proceed as directed for Colistimethate Sodium under *Antibiotics—Microbial Assays* ⟨81⟩, using an accurately measured volume of *Assay preparation* diluted quantitatively with *Buffer No. 6* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Colistin Sulfate

Colistin, sulfate.

Colistins sulfate [1264-72-8].

» Colistin Sulfate is the sulfate salt of an antibacterial substance produced by the growth of *Bacillus polymyxa* var. *colistinus*. It has a potency equivalent to not less than 500 µg of colistin per mg.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** ⟨11⟩—

USP Colistin Sulfate RS

**Identification**—

**A:** Dissolve about 20 mg in 2 mL of buffer solution, prepared by adjusting 50 mL of 1 M monobasic potassium phosphate with 1 N sodium hydroxide to a pH of 7.0, diluting with water to 100 mL, and mixing. Add 0.2 mL of ninhydrin solution (1 in 200) and boil: a purple color is produced.

**B:** It meets the requirements of the tests for *Sulfate* ⟨191⟩.

**C: Liquid Chromatographic Identification Test**—

**Mobile phase**—Prepare a mixture of 0.1 M tribasic sodium phosphate and acetonitrile (77:23), and adjust with

phosphoric acid to a pH of 3.0. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard solution**—Prepare a solution of USP Colistin Sulfate RS in *Mobile phase* having a concentration of about 6 mg per mL. Protect this solution from light.

**Test solution**—Prepare a solution of Colistin Sulfate in *Mobile phase* having a concentration of about 6 mg per mL. Protect this solution from light.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 212-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1 mL per minute.

**Procedure**—Separately inject equal volumes (about 10 μL) of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatograms. The chromatogram obtained from the *Test solution* corresponds qualitatively with that obtained from the *Standard solution*, exhibiting a major peak corresponding to colistin A and minor peaks at relative retention times of about 0.55 (colistin B) and 0.8.

**pH** <791>: between 4.0 and 7.0, in a solution containing 10 mg per mL.

**Loss on drying** <731>—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 7.0% of its weight.

**Assay**—Proceed as directed for Colistin under *Antibiotics—Microbial Assays* <81>.

## Colistin Sulfate for Oral Suspension

» Colistin Sulfate for Oral Suspension is a dry mixture of Colistin Sulfate with or without one or more suitable buffers, colors, diluents, dispersants, and flavors. It contains the equivalent of not less than 90.0 percent and not more than 120.0 percent of the labeled amount of colistin.

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** <11>—

USP Colistin Sulfate RS

**Uniformity of dosage units** <905>—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** <698>: meets the requirements.

**pH** <791>: between 5.0 and 6.0, in the suspension constituted as directed in the labeling.

**Loss on drying** <731>—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours; it loses not more than 3.0% of its weight.

**Assay**—Constitute Colistin Sulfate for Oral Suspension as directed in the labeling. Proceed as directed under *Antibiotics—Microbial Assays* <81> using an accurately measured volume of this suspension, freshly mixed and free from air bubbles, diluted quantitatively with *Buffer No. 6* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Colistin and Neomycin Sulfates and Hydrocortisone Acetate Otic Suspension

» Colistin and Neomycin Sulfates and Hydrocortisone Acetate Otic Suspension is a sterile suspension containing the equivalent of not less than 90.0 percent and not more than 135.0 percent of the labeled amount of colistin, not less than 90.0 percent and not more than 125.0 percent of the labeled amount of neomycin, and not less than 90.0 percent and not more than 110.0 percent of the labeled amount of hydrocortisone acetate (C<sub>23</sub>H<sub>32</sub>O<sub>6</sub>). It contains one or more suitable buffers, detergents, dispersants, and preservatives.

**NOTE**—Where Colistin and Neomycin Sulfates and Hydrocortisone Acetate Otic Suspension is prescribed, without reference to the quantity of colistin, neomycin, or hydrocortisone acetate contained therein, a product containing 3.0 mg of colistin, 3.3 mg of neomycin, and 10 mg of hydrocortisone acetate per mL shall be dispensed.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Colistin Sulfate RS

USP Neomycin Sulfate RS

USP Hydrocortisone Acetate RS

**Sterility** <71>: meets the requirements, 0.25 mL from each container being transferred directly to 90 mL of each medium.

**pH** <791>: between 4.8 and 5.2.

**Assay for colistin**—Proceed as directed under *Antibiotics—Microbial Assays* <81>, using a freshly mixed, accurately measured volume of Otic Suspension diluted quantitatively and stepwise with *Buffer No. 6* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for neomycin**—Proceed as directed under *Antibiotics—Microbial Assays* <81>, using a freshly mixed, accurately measured volume of Otic Suspension diluted quantitatively and stepwise with *Buffer No. 3* to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

**Assay for hydrocortisone acetate**—

**Reagent blank**—Dilute 200 mL of 22 N sulfuric acid with 100 mL of dehydrated alcohol.

**Phenylhydrazine reagent**—Dissolve 43.33 mg of phenylhydrazine hydrochloride in 100 mL of *Reagent blank*.

**Standard preparation**—Dissolve a suitable quantity of USP Hydrocortisone Acetate RS, accurately weighed, in chloroform, and dilute quantitatively and stepwise with chloroform to obtain a solution having a known concentration of about 10 μg per mL.

**Assay preparation**—Transfer 5.0 mL of freshly mixed Otic Suspension to a 125-mL separator. Extract with three 20-mL portions of chloroform, filtering each chloroform extract through a pledget of cotton previously saturated with chloroform, collect the filtrates in a 100-mL volumetric flask, dilute with chloroform to volume, and mix. Pipet 10 mL of this solution into a 100-mL volumetric flask, dilute with chloroform to volume, and mix. Pipet 20 mL of this solution into a 100-mL volumetric flask, dilute with chloroform to volume, and mix.

**Procedure**—Pipet 50 mL each of the *Standard* and the *Assay preparation* into separate 125-mL separators, add 2 mL of 0.1 N sodium hydroxide to each separator, shake, and allow the layers to separate. Filter both chloroform layers through glass wool, and collect the filtrates in separate beakers. Pipet two 20-mL portions of each chloroform filtrate into separate 125-mL separators. Add 25.0 mL of *Phenylhydrazine reagent* to one separator each of the filtrates from the *Standard preparation* and the *Assay preparation*, respectively, and add 25.0 mL of *Reagent blank* to the remaining two separators. Shake all four separators well, allow the layers to separate, and discard the chloroform layers. Drain the aqueous layers into separate centrifuge tubes, and centrifuge for 2 minutes. Pipet 10 mL of each solution into separate glass-stoppered test tubes. Place the tubes in a water bath maintained at a temperature of 60° for 30 minutes, then cool the solution to room temperature. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 410 nm, with a suitable spectrophotometer, using water to set the instrument. Calculate the quantity, in mg, of hydrocortisone acetate ( $C_{23}H_{32}O_6$ ) in each mL of the Otic Suspension taken by the formula:

$$C(A_U - A_{UB} / A_S - A_{SB})$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Hydrocortisone Acetate RS in the *Standard preparation*;  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation* treated with *Phenylhydrazine reagent*, respectively; and  $A_{UB}$  and  $A_{SB}$  are the absorbances of the solution from the *Assay preparation* and the *Standard preparation* treated with the *Reagent blank*, respectively.

## Collodion

### DEFINITION

Collodion contains NLT 5.0%, by weight, of pyroxylin.

Pyroxylin	40 g
Ether	750 mL
Alcohol	250 mL
To make about	1000 mL

To the *Pyroxylin* in a suitable container add the *Alcohol* and *Ether*, and insert the stopper into the container. Shake the mixture occasionally until the *Pyroxylin* is dissolved.

[**CAUTION**—Collodion is highly flammable.]

### IDENTIFICATION

#### A.

**Analysis:** Expose a thin layer to air, leaving a transparent, tenacious film.

**Acceptance criteria:** The film of pyroxylin so obtained burns rapidly with a yellow flame.

#### B.

**Analysis:** Mix with an equal volume of water.

**Acceptance criteria:** A viscid, stringy mass of pyroxylin is produced.

### ASSAY

#### PROCEDURE

**Sample:** 10 mL

**Analysis:** Quickly pour the *Sample* into a tared flask, insert the stopper, and weigh the *Assay charge* accurately. Remove the stopper, warm on a steam bath, and

add 10 mL of water dropwise, with constant stirring. Evaporate the mixture on a steam bath, and dry the residue at 105° for 4 h.

**Acceptance criteria:** NLT 5.0%, by weight

### OTHER COMPONENTS

#### ALCOHOL DETERMINATION (611)

**Internal standard solution:** Acetone and 1,2-dichloroethane (20:80) in a glass-stoppered graduated cylinder  
**Standard stock solutions:** Transfer 10-, 20-, and 30-mL portions of dehydrated alcohol into separate 100-mL volumetric flasks, dilute with 1,2-dichloroethane to volume, and mix.

**Standard solutions:** Mix 10 mL of each *Standard stock solution* with 15 mL of 1,2-dichloroethane, 10 mL of hexane, and 10.0 mL of *Internal standard solution* in separate glass-stoppered, 50-mL graduated cylinders.

**Sample solution:** To 10 mL of Collodion in a glass-stoppered, 50-mL graduated cylinder add 15 mL of 1,2-dichloroethane, 10 mL of hexane, and 10.0 mL of *Internal standard solution*. Mix, and allow the precipitate to settle.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** GC

**Detector:** Thermal conductivity

**Column:** 1.8-m  $\times$  3.5-mm glass; packing S3

**Temperatures**

**Column:** 150°

**Injection port:** 200°

**Detector:** 250°

**Carrier gas:** Helium

**Flow rate:** 50 mL/min

**Injection volume:** 4  $\mu\text{L}$

#### Analysis

**Samples:** *Standard solutions* and *Sample solution*

Calculate the relative response factor,  $F$ , for each *Standard solution* taken:

$$F = C_S / R_S$$

$C_S$  = concentration of alcohol in the *Standard solution*, as a percentage (v/v)

$R_S$  = peak response ratio of alcohol to acetone from the respective *Standard solution*

Calculate the percentage of alcohol ( $C_2H_5OH$ ) in the portion of Collodion taken:

$$\text{Result} = R_U \times F_a$$

$R_U$  = peak response ratio of alcohol to acetone from the *Sample solution*

$F_a$  = average of the individual  $F$  values

**Acceptance criteria:** 22.0%–26.0%

### SPECIFIC TESTS

#### SPECIFIC GRAVITY (841): 0.765–0.775

#### ACIDITY

**Sample:** 5 mL

**Analysis:** Add the *Sample* to 5 mL of water.

**Acceptance criteria:** The liquid separated from the pyroxylin is not acid to litmus.

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Package in tight containers, at a temperature not exceeding 30°, remote from fire.

• **LABELING:** The label bears a caution statement to the effect that Collodion is highly flammable.

## Flexible Collodion

### DEFINITION

Prepare Flexible Collodion as follows.

Camphor	20 g
Castor Oil	30 g
Collodion, a sufficient quantity to make	1000 g

Weigh the ingredients, successively, into a dry, tared bottle. Insert the stopper in the bottle, and shake the mixture until the *Camphor* is dissolved.

### IDENTIFICATION

- **A.**  
**Analysis:** Expose a thin layer to air, leaving a transparent, tenacious film.  
**Acceptance criteria:** The film exhibits a distinct odor of camphor. The film of pyroxylin so obtained burns rapidly with a yellow flame.
- **B.**  
**Analysis:** Mix with an equal volume of water.  
**Acceptance criteria:** A viscid, stringy mass of pyroxylin is produced.

### ASSAY

- **ALCOHOL DETERMINATION (611)**  
**Internal standard solution:** Acetone and 1,2-dichloroethane (20:80) in a glass-stoppered, graduated cylinder  
**Standard stock solutions:** Transfer 10-, 20-, and 30-mL portions of dehydrated alcohol into separate 100-mL volumetric flasks, dilute with 1,2-dichloroethane to volume, and mix.  
**Standard solutions:** Mix 10 mL of each *Standard stock solution* with 15 mL of 1,2-dichloroethane, 10 mL of hexane, and 10.0 mL of *Internal standard solution* in separate, glass-stoppered, 50-mL graduated cylinders.  
**Sample solution:** To 10 mL of Flexible Collodion in a glass-stoppered, 50-mL graduated cylinder add 15 mL of 1,2-dichloroethane, 10 mL of hexane, and 10.0 mL of *Internal standard solution*. Mix, and allow the precipitate to settle.  
**Chromatographic system**  
 (See *Chromatography (621)*, *System Suitability*).  
**Mode:** GC  
**Detector:** Thermal conductivity  
**Column:** 1.8-m × 3.5-mm glass; support S3  
**Temperatures**  
**Column:** 150°  
**Injection port:** 200°  
**Detector:** 250°  
**Carrier gas:** Helium  
**Flow rate:** 50 mL/min  
**Injection volume:** 4 µL  
**Analysis**  
**Samples:** *Standard solutions* and *Sample solution*  
 Calculate the relative response factor, *F*, for each *Standard solution* taken:

$$F = C_S/R_S$$

- $C_S$  = concentration of alcohol in the *Standard solution*, as a percentage (v/v)  
 $R_S$  = peak response ratio of alcohol to acetone from the respective *Standard solution*  
 Calculate the percentage of alcohol (C<sub>2</sub>H<sub>5</sub>OH) in the portion of Flexible Collodion taken:

$$\text{Result} = R_U \times F_A$$

- $R_U$  = peak response ratio of alcohol to acetone from the *Sample solution*  
 $F_A$  = average of the individual *F* values

Acceptance criteria: 21.0%–25.0%

### SPECIFIC TESTS

- **SPECIFIC GRAVITY (841):** 0.770–0.790

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight containers, at a temperature not exceeding 30°, remote from fire.
- **LABELING:** The label bears a caution statement to the effect that Flexible Collodion is highly flammable.

## Colloidal Oatmeal

### DEFINITION

Colloidal Oatmeal is the powder resulting from the grinding and further processing of whole oat grain meeting U.S. Standards for Number 1 or Number 2 oats (7 CFR 810.1001).

### IDENTIFICATION

- **A.**  
**Analysis:** Prepare a smooth mixture of 10 g of Colloidal Oatmeal and 100 mL of warm water. Stir for 10 min.  
**Acceptance criteria:** The resulting slurry has a characteristic slippery feel and shows the development of slimy, viscous strands.
- **B.** A water slurry is colored reddish violet to deep blue by iodine TS.

### IMPURITIES

- **ARTICLES OF BOTANICAL ORIGIN, Total Ash (561):** NMT 2.5% on the dried basis

### SPECIFIC TESTS

- **NITROGEN DETERMINATION Method I (461):** NLT 2.0%
- **MICROBIAL ENUMERATION TESTS (61)** and **TESTS FOR SPECIFIED MICROORGANISMS (62):** The total aerobic microbial count does not exceed 10<sup>4</sup> cfu/g; the total combined molds and yeasts count does not exceed 150 cfu/g.
- **LOSS ON DRYING (731):** Dry a sample at 120° for 4 h: it loses NMT 10% of its weight.
- **PARTICLE SIZE DISTRIBUTION ESTIMATION BY ANALYTICAL SIEVING (786):** NMT 3% of the total particles exceed 150 µm in size and NMT 20% of the total particles exceed 75 µm in size.
- **FAT CONTENT**  
**Sample:** 4 g  
**Analysis:** Dry the *Sample* in vacuum at 100° for about 5 h. Extract the fat from it with anhydrous ethyl ether, using a continuous extraction apparatus, the extraction period being 4 h at a condensation rate of 5–6 drops/s. Evaporate the ether from the extract, transfer it to a tared beaker, and dry at 100° to constant weight. Perform a blank determination. Calculate the percentage of fat found, corrected for the blank.  
**Acceptance criteria:** NLT 0.2%
- **ROTATIONAL RHEOMETER METHODS (912)**

**Sample solution:** Transfer 25 g of Colloidal Oatmeal in small portions, with stirring at 1000 rpm over a 1-min period, to 500 mL of water contained in a beaker, maintained at 45° and equipped with a variable speed mixer. Stir for 5 min after the addition of the last portion of oatmeal. Allow the suspension to stand for 90 min, and equilibrate to ambient temperature. Stir the suspension at 800 rpm for 1 min.

**Apparatus:** Equip a suitable rotational viscometer with a spindle having a cylinder 1.88 cm in diameter and 6.25 cm high attached to a shaft 0.32 cm in diameter, the distance from the top of the cylinder to the lower tip of the shaft being 0.75 cm, and the immersion depth being 8.15 cm (No. 1 spindle).

**Analysis:** Determine and record the viscosity of the suspension, with the spindle rotating at 60 rpm. Convert

to centipoise by multiplying the reading by the constant for the viscometer spindle and speed employed.

**Acceptance criteria:** The average of three viscosities obtained is greater than 1 and less than 100 centipoises.

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

### Copper Gluconate

$C_{12}H_{22}CuO_{14}$  453.84  
Copper, bis(D-gluconato-O<sup>1</sup>,O<sup>2</sup>)-;  
Copper D-gluconate (1:2) [527-09-3].

#### DEFINITION

Copper Gluconate contains NLT 98.0% and NMT 102.0% of copper gluconate ( $C_{12}H_{22}CuO_{14}$ ).

#### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Copper <191>:** A 50-mg/mL solution meets the requirements.
- **B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST**  
**Standard solution:** 10 mg/mL of USP Potassium Gluconate RS  
**Sample solution:** 10 mg/mL of Copper Gluconate, heating in a water bath at 60°, if necessary, to dissolve  
**Chromatographic system**  
(See *Chromatography* <621>, *Thin-Layer Chromatography*.)  
**Mode:** TLC  
**Adsorbent:** 0.25-mm layer of chromatographic silica gel  
**Application volume:** 5 µL  
**Developing solvent system:** Alcohol, ethyl acetate, ammonium hydroxide, and water (50:10:10:30)  
**Spray reagent:** Dissolve 2.5 g of ammonium molybdate in 50 mL of 2 N sulfuric acid in a 100-mL volumetric flask, add 1.0 g of ceric sulfate, swirl to dissolve, and dilute with 2 N sulfuric acid to volume.

#### Analysis

**Samples:** *Standard solution* and *Sample solution*  
Develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and dry at 110° for 20 min. Allow to cool, and spray with the *Spray reagent*. Heat the plate at 110° for about 10 min.  
**Acceptance criteria:** The principal spot of the *Sample solution* corresponds in color, size, and  $R_f$  value to that of the *Standard solution*.

#### ASSAY

- **PROCEDURE**  
**Sample:** 1.5 g of Copper Gluconate  
**Blank:** 100 mL of water  
**Titrimetric system**  
(See *Titrimetry* <541>.)  
**Mode:** Indirect titration  
**Titrant:** 0.1 N sodium thiosulfate VS  
**Endpoint detection:** Visual  
**Analysis:** Dissolve the *Sample* in 100 mL of water. Add 2 mL of glacial acetic acid and 5 g potassium iodide, mix, and titrate with *Titrant* to a light yellow color. Add 2 g of ammonium thiocyanide, and mix. Add 3 mL of starch TS, and continue titrating to a milk-white endpoint. Perform the *Blank* determination.

Calculate the percentage of copper gluconate ( $C_{12}H_{22}CuO_{14}$ ) in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F / W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)  
 $V_B$  = *Titrant* volume consumed by the *Blank* (mL)  
 $N$  = actual normality of the *Titrant* (mEq/mL)  
 $F$  = equivalency factor, 453.8 mg/mEq  
 $W$  = *Sample* weight (mg)  
**Acceptance criteria:** 98.0%–102.0%

#### IMPURITIES

- **CHLORIDE AND SULFATE, Chloride <221>**  
**Standard solution:** 1.0 mL of 0.020 N hydrochloric acid  
**Sample:** 1.0 g  
**Acceptance criteria:** NMT 0.07%
- **CHLORIDE AND SULFATE, Sulfate <221>**  
**Standard solution:** 1.0 mL of 0.020 N sulfuric acid  
**Sample:** 2.0 g  
**Acceptance criteria:** NMT 0.05%
- **ARSENIC, Method I <211>**  
**Test preparation:** 1.0 g in 35 mL of water  
**Acceptance criteria:** NMT 3 ppm
- **LIMIT OF LEAD**

[NOTE—For the preparation of all aqueous solutions and for the rinsing of glassware before use, use water that has been passed through a strong-acid, strong-base, mixed-bed ion-exchange resin. Select all reagents to have as low a content of lead as practicable, and store all reagent solutions in containers of borosilicate glass. Cleanse glassware before use by soaking in warm 8 N nitric acid for 30 min and by rinsing with deionized water.]

**Standard stock solution:** Transfer 10.0 mL of *Lead Nitrate Stock Solution*, prepared as directed in *Heavy Metals* <231>, to a 100-mL volumetric flask. Add 40 mL of water and 5 mL of nitric acid, and dilute with water to volume.

**Standard solution:** Transfer 0.40 mL of *Standard stock solution* to a 100-mL volumetric flask. Add 50 mL of water and 1 mL of nitric acid, and dilute with water to volume. This solution contains 0.04 µg/mL of lead.

**Sample stock solution:** Transfer 4 g of Copper Gluconate to a 100-mL volumetric flask. Add 50 mL of water and 5 mL of nitric acid, and sonicate to dissolve the specimen. Dilute with water to volume. Transfer 4.0 mL of this solution to a second 100-mL volumetric flask. Add 50 mL of water and 1 mL of nitric acid, dilute with water to volume, and mix.

**Blank:** Transfer 1.2 mL of nitric acid to a 100-mL volumetric flask and dilute with water to volume.

**Sample solution A:** Mix 10.0 mL of the *Sample stock solution* with 10.0 mL of *Blank*. This solution contains 0.00 µg/mL of added lead from the *Standard solution*.

**Sample solution B:** Mix 10.0 mL of the *Sample stock solution* with 4.0 mL of the *Standard solution* and 6.0 mL of *Blank*. This solution contains 0.008 µg/mL of added lead from the *Standard solution*.

**Sample solution C:** Mix 10.0 mL of the *Sample stock solution* with 7.0 mL of the *Standard solution* and 3.0 mL of *Blank*. This solution contains 0.014 µg/mL of added lead from the *Standard solution*.

**Sample solution D:** Mix 10.0 mL of the *Sample stock solution* with 10.0 mL of the *Standard solution*. This solution contains 0.020 µg/mL of added lead from the *Standard solution*.

#### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Graphite furnace atomic absorption spectrophotometry

**Analytical wavelength:** 283.3 nm  
**Lamp:** Lead hollow-cathode  
**Argon flow rate:** 3 L/min, or as noted  
**Graphite tube temperature:** See Table 1.

Table 1

Temperature (°)	Time (s)
70	10
90	60
120	15
250 (no gas flow)	5
250	10
250 (no gas flow)	2
2000	3.2

**Injection volume:** 20 µL

#### Analysis

**Samples:** Blank and Sample solutions A, B, C, and D

The graphite tube is temperature-programmed to reach 2000° in about 2 min, as shown in Table 1. When the temperature reaches 2000°, determine the absorbance at 283.3 nm, corrected for background absorption. Inject the Sample solutions and Blank, and determine the absorbances. Correct the absorbance values from the Sample solutions by subtracting from each the absorbance value from the Blank. Plot the corrected absorbances of the Sample solutions versus their added lead concentrations, in µg/mL. Draw the straight line best fitting the four points, and extrapolate the line until it intercepts the concentration axis. From the intercept, determine the concentration, C, in µg/mL, of lead in Sample solution A.

Calculate the content of lead in the portion of Copper Gluconate taken:

$$\text{Result} = (C \times V)/W$$

- C = concentration of lead in the Sample solution A (µg/mL), determined from the intercept of the linear regression line  
 V = volume of solvent taken to prepare the Sample solution A (mL)  
 W = weight of Calcium Gluconate taken to prepare the Sample solution A (g)

**Acceptance criteria:** NMT 25 µg/g

#### • REDUCING SUBSTANCES

**Sample:** 1.0 g of Copper Gluconate

**Blank:** 10 mL of water

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Residual titration

**Titrant:** 0.1 N iodine VS

**Back-titrant:** 0.1 N sodium thiosulfate VS

**Endpoint detection:** Visual

**Analysis:** Transfer the Sample to a 250-mL conical flask, add 10 mL of water to dissolve the Sample, then add 25 mL of alkaline cupric citrate TS. Cover the flask, boil gently for 5 min, accurately timed, and cool rapidly to room temperature. Add 25 mL of 0.6 N acetic acid, 10.0 mL of Titrant, and 10 mL of 3 N hydrochloric acid, and titrate with Back-titrant, adding 3 mL of starch TS as the endpoint is approached. Perform the Blank determination.

Calculate the percentage of reducing substances (as dextrose) in the Sample taken:

$$\text{Result} = \{[(V_b - V_s) \times N \times F]/W\} \times 100$$

V<sub>b</sub> = Back-titrant volume consumed by the Blank (mL)

V<sub>s</sub> = Back-titrant volume consumed by the Sample (mL)

N = actual normality of the Back-titrant (mEq/mL)

F = equivalency factor, 27 mg/mEq

W = Sample weight (mg)

**Acceptance criteria:** NMT 1.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** (11)

USP Potassium Gluconate RS

## Corticotropin Injection

Corticotropin.

Corticotropin [9002-60-2].

» Corticotropin Injection is a sterile solution, in a suitable diluent, of the material containing the polypeptide hormone having the property of increasing the rate of secretion of adrenal corticosteroids, which is obtained from the anterior lobe of the pituitary of mammals used for food by man. Its potency is not less than 80.0 percent and not more than 125.0 percent of the potency stated on the label in USP Corticotropin Units. It may contain a suitable antimicrobial agent.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store in a cold place.

**Labeling**—If the labeling of Injection recommends intravenous administration, include specific information on dosage.

**USP Reference standards** (11)—

USP Ascorbic Acid RS

USP Corticotropin RS

USP Endotoxin RS

USP Vasopressin RS

**Bacterial endotoxins** (85)—It contains not more than 3.1 USP Endotoxin Units per USP Corticotropin Unit.

**Vasopressin activity**—

**Phosphate buffer**—Dissolve 6.6 g of dibasic ammonium phosphate in about 950 mL of water, and adjust with concentrated phosphoric acid to a pH of 3.0. Dilute with water to 1 L, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of Phosphate buffer and acetonitrile (87:13). [NOTE—The retention time of the vasopressin peak is very sensitive to small changes in the acetonitrile concentration.]

**Standard solution**—Dissolve the entire contents of a vial of USP Vasopressin RS in a known volume of Phosphate buffer, and dilute with Phosphate buffer to obtain a final solution containing 0.1 USP Vasopressin Unit per mL.

**Test solution**—Dissolve the entire contents of a vial of the Injection in a known volume of Phosphate buffer, and dilute with Phosphate buffer to obtain a final solution containing 2.0 USP Corticotropin Units per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a variable wavelength detector set at 220 nm and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the Standard solution, and record the peak responses as directed for Procedure: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the vasopressin activity.

ity in USP Vasopressin Unit per USP Corticotropin Unit by the formula:

$$C(r_U / r_S)/2$$

in which  $C$  is the concentration, in USP Vasopressin Units per mL, of the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively. The vasopressin activity is not more than 0.05 USP Vasopressin Unit per USP Corticotropin Unit.

**pH** (791): between 3.0 and 7.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Standard preparation**—Pipet 2.5 mL of gelatin TS into an opened container of USP Corticotropin RS, and mix, to obtain a solution having a concentration of 2.0 USP Corticotropin Units per mL. Using gelatin TS as a diluent, prepare three diluted standard solutions such that the respective concentrations of corticotropin constitute a geometric series such as 1:2:4 or 1:3:9 and such that the quantity of corticotropin in each 0.5 mL lies within the range of 10 to 300 milli-units.

**Assay preparation**—In the same manner, using the same diluent, dilute the Injection to give three test solutions corresponding to those of the standard.

**The animals**—Select healthy rats, of the same but either sex, that have been raised on a diet fully adequate with respect to vitamin and mineral content. Anesthetize the rats with ether, and remove the hypophysis from each by application of gentle suction through a fine-tipped tube. Between 16 and 48 hours after the operation, select those rats weighing between 80 and 180 g, but restrict the selection so that no rat is more than 30% heavier than the lightest, and the number of rats is an exact multiple of 6. Separate the selected rats into 6 groups, equal in size, of not less than 6 rats each, and assign at random one of the three diluted standard solutions or of the three test solutions to each group.

**Procedure**—Inject all rats of each group subcutaneously with the assigned test doses. Three hours after the injection, anesthetize the rats, and remove both adrenal glands from each rat, free them from adhering tissue, and promptly weigh each pair on a suitable balance to the nearest 0.2 mg. Place the weighed glands from each rat in suitable vessels each containing 8.0 mL of metaphosphoric acid solution (1 in 40), and comminute the glands as by grinding with a small quantity of washed sand. Cover each vessel, and proceed similarly until all glands have been extracted.

**Ascorbic acid determination**—Filter the metaphosphoric acid extracts, and pipet 4 mL of each filtrate into suitable vessels each containing 4.0 mL of indophenol-acetate TS. Mix by shaking, and read the absorbance at 520 nm, with a suitable spectrophotometer. From the observed absorbance and the standard curve prepared as directed in the next paragraph, calculate the amount of ascorbic acid in terms of mg of ascorbic acid in each 100 g of adrenal gland tissue.

Prepare a standard concentration-absorbance curve, using three standard solutions containing in each mL, respectively, 6.0, 8.0, and 10.0 µg of USP Ascorbic Acid RS in metaphosphoric acid solution (1 in 40). Pipet into each of 3 suitable vessels, preferably spectrophotometer cells, 4 mL of indophenol-acetate TS. Add 4.0 mL of one of the three standard ascorbic acid solutions to one of the cells, mix, and promptly read the absorbance in the same instrument and under the same conditions as for the adrenal gland extracts. Repeat the process for the other two standard ascorbic acid solutions, plot the concentration-absorbance values, and draw the straight line best fitting the 3 plotted points.

**Calculation**—Tabulate the observed concentration of ascorbic acid in the adrenal glands of each rat, designated by

the symbol  $y$ , for each dosage group of  $f$  rats. If the data from one or more rats are missing, adjust to groups of equal size by suitable means (see *Replacement of Missing Values* (111)). Total the values of  $y$  in each group, and designate each total as  $T$ , subscripts 1 to 3 for the three successive dosage levels and subscripts  $S$  and  $U$  for the Standard and the Injection, respectively. Test both the agreement in slope of the dosage-response lines for the Standard and for the Injection, and the lack of curvature, as directed for a 3-dose balanced assay (see *Tests of Assay Validity* (111)). If the combined discrepancy as measured by  $F_3$  exceeds its tabular value in Table 9 (see *Combination of Independent Assays* (111)), regard these data as preliminary and repeat the assay.

Determine the logarithm of potency of the Injection by the formula:

$$M = (4iT_a / 3T_b) + \log R,$$

in which  $T_a = \Sigma(T_U - T_S)$ ;  $T_b = \Sigma(T_3 - T_1)$ ;  $i$  is the interval between successive log doses of both the *Standard preparation* and the *Assay preparation*; and  $R = v_S / v_U$  is the ratio of the high dose of the Standard in USP Units ( $v_S$ ) to the high dose of the Injection in mL ( $v_U$ ).

Compute the log confidence interval  $L$  (see *Confidence Intervals for Individual Assays* (111)).

**Replication**—Repeat the entire determination at least once. Test the agreement among the two or more independent determinations, and compute the weight for each (see *Combination of Independent Assays* (111)). Calculate the weighted mean log-potency  $\bar{M}$  and its confidence interval,  $L_c$  (see *Confidence Intervals for Individual Assays* (111)). The potency,  $P$ , is satisfactory if  $P = \text{antilog } \bar{M}$  is not less than 80% and not more than 125% of the labeled potency and if the confidence interval does not exceed 0.40.

## Corticotropin for Injection

Corticotropin.

Corticotropin [9002-60-2].

» Corticotropin for Injection is the sterile, dry material containing the polypeptide hormone having the property of increasing the rate of secretion of adrenal corticosteroids, which is obtained from the anterior lobe of the pituitary of mammals used for food by man. Its potency is not less than 80.0 percent and not more than 125.0 percent of the potency stated on the label in USP Corticotropin Units. It may contain a suitable antimicrobial agent and suitable diluents and buffers.

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* (1).

**Labeling**—If the labeling of Corticotropin for Injection recommends intravenous administration, include specific information on dosage.

#### USP Reference standards (11)—

USP Ascorbic Acid RS  
USP Corticotropin RS  
USP Endotoxin RS  
USP Vasopressin RS

**Bacterial endotoxins** (85)—It contains not more than 3.1 USP Endotoxin Units per USP Corticotropin Unit.

#### Vasopressin activity—

*Phosphate buffer, Mobile phase, Standard solution, and Chromatographic system*—Prepare as directed for *Vasopressin activity* under *Corticotropin Injection*.

**Test solution**—Dissolve the entire contents of a vial of Corticotropin for Injection in a known volume of *Phosphate buffer*, and dilute with *Phosphate buffer* to obtain a final solution containing 2.0 USP Corticotropin Units per mL.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the vasopressin activity in USP Vasopressin Unit per USP Corticotropin Unit by the formula:

$$C(r_u / r_s)/2$$

in which C is the concentration, in USP Vasopressin Units per mL, of the *Standard solution*; and  $r_u$  and  $r_s$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively. The vasopressin activity is not more than 0.05 USP Vasopressin Unit per USP Corticotropin Unit.

**pH** (791): between 2.5 and 6.0, in a solution constituted as directed in the labeling supplied by the manufacturer.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Sterility Tests* (71), *Uniformity of Dosage Units* (905), and *Constituted Solutions and Labeling under Injections* (1).

**Assay**—Proceed with the constituted solution of Corticotropin for Injection as directed in the Assay under *Corticotropin Injection*.

## Repository Corticotropin Injection

Corticotropin.  
Corticotropin [9002-60-2].

» Repository Corticotropin Injection is corticotropin in a solution of partially hydrolyzed gelatin. Its potency is not less than 80.0 percent and not more than 125.0 percent of the potency stated on the label in USP Corticotropin Units. It may contain a suitable antimicrobial agent.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP Ascorbic Acid RS  
USP Corticotropin RS  
USP Endotoxin RS  
USP Vasopressin RS

**Bacterial endotoxins** (85)—It contains not more than 3.1 USP Endotoxin Units per USP Corticotropin Unit.

**Vasopressin activity, pH, and Assay**—It meets the requirements for *Vasopressin activity*, *pH*, and *Assay* under *Corticotropin Injection*.

**Other requirements**—It meets the requirements under *Injections* (1).

## Corticotropin Zinc Hydroxide Injectable Suspension

Corticotropin zinc hydroxide.  
Corticotropin zinc hydroxide [9050-75-3].

» Corticotropin Zinc Hydroxide Injectable Suspension is a sterile suspension of corticotropin adsorbed on zinc hydroxide. Its potency is not less than 80.0 percent and not more than

125.0 percent of the potency stated on the label in USP Corticotropin Units. It contains not less than 1800  $\mu$ g and not more than 2200  $\mu$ g of zinc, and not less than 604  $\mu$ g and not more than 776  $\mu$ g of anhydrous dibasic sodium phosphate, for each 40 USP Corticotropin Units.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass. Store at controlled room temperature.

**Labeling**—Label it to indicate that it is not recommended for intravenous use and that the suspension is to be well shaken before use. The container label and the package label state the potency in USP Corticotropin Units in each mL.

**USP Reference standards** (11)—

USP Ascorbic Acid RS  
USP Corticotropin RS  
USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 3.1 USP Endotoxin Units per USP Corticotropin Unit.

**pH** (791): between 7.5 and 8.5, determined potentiometrically.

**Zinc**—Pipet a volume of the well-shaken Injectable Suspension, equivalent to about 6 mg of zinc, into a 125-mL conical flask, and add 2 mL of a buffer mixture containing 5.4 g of ammonium chloride and 26 mL of ammonium hydroxide in each 100 mL. Add 10 mL of water and 2 drops of eriochrome black TS, and titrate with 0.005 M edetate disodium VS to a clear blue endpoint. Perform a blank titration, and make any necessary correction. Each mL of 0.005 M edetate disodium is equivalent to 0.327 mg of Zn.

**Anhydrous dibasic sodium phosphate**—

**Ammonium molybdate reagent**—Dissolve 6.4 g of ammonium molybdate in 40 mL of water, and add 50 mL of 10 N sulfuric acid. Mix, and dilute with water to 100 mL. This solution is stable for about 2 weeks.

**Stannous chloride reagent**—Dissolve 1 g of stannous chloride in 5 mL of hydrochloric acid. Just prior to use, dilute 1 mL of this solution with water to 100 mL.

**Standard preparation**—Weigh accurately about 275 mg of anhydrous dibasic sodium phosphate ( $\text{Na}_2\text{HPO}_4$ ) into a 1000-mL volumetric flask. Dissolve in and dilute with water to volume. Dilute 10 mL of this solution with water to 100 mL.

**Test preparation**—Pipet 1 mL of the well-shaken Injectable Suspension into a 25-mL volumetric flask, add 0.1 mL of 10 N sulfuric acid, mix, dilute with water to volume, and again mix.

**Procedure**—Into separate 100-mL volumetric flasks pipet duplicate 10-mL portions of *Test preparation*, duplicate 10-mL portions of *Standard preparation*, and 10 mL of water to provide a blank. Treat each flask as follows. Dilute the contents with water to 60 mL, then add 10 mL of 10 N sulfuric acid, and mix. Add 10 mL of *Ammonium molybdate reagent*, mix, add 10 mL of water, and again mix. Add slowly, with mixing, 5 mL of *Stannous chloride reagent*, dilute with water to volume, and mix. Measure the absorbances of the solutions at 10 minutes, accurately timed, after the first addition of the *Stannous chloride reagent*, at a wavelength of 710 nm, with a suitable spectrophotometer, relative to the blank. Calculate the quantity, in  $\mu$ g, of anhydrous dibasic sodium phosphate in the portion of Injectable Suspension taken by the formula:

$$25C(A_u / A_s)$$

in which C is the concentration, in  $\mu$ g per mL, of  $\text{Na}_2\text{HPO}_4$  in the *Standard preparation*; and  $A_u$  and  $A_s$  are the absorbances of the solutions from the *Test preparation* and the *Standard preparation*, respectively.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Add sufficient 0.1 N hydrochloric acid to Injectable Suspension to effect complete solution, and using this in making the *Assay preparation*, proceed as directed in the Assay under *Corticotropin Injection*.

## Cortisone Acetate

$C_{23}H_{30}O_6$  402.48  
Pregn-4-ene-3,11,20-trione, 21-(acetyloxy)-17-hydroxy-;  
17,21-Dihydroxypregn-4-ene-3,11,20-trione 21-acetate  
[50-04-4].

### DEFINITION

Cortisone Acetate contains NLT 97.0% and NMT 102.0% of cortisone acetate ( $C_{23}H_{30}O_6$ ), calculated on the dried basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

**Sample:** Dissolve in methanol, evaporate the methanol on a steam bath, and dry at 105° for 30 min.

**Acceptance criteria:** Meets the requirements

#### • B. ULTRAVIOLET ABSORPTION (197U)

**Analytical wavelength:** 238 nm

**Medium:** Methanol

**Sample solution:** 10 µg/mL

**Acceptance criteria:** Absorptivities, calculated on the dried basis, do not differ by more than 3.0%.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile and water (45:55)

**Buffer:** Transfer 20 mL of 1 N hydrochloric acid, 150 mL of 0.5 N potassium chloride, and 50 mL of 0.5 M sodium acetate to a 1-L volumetric flask, and dilute with water to volume.

**Diluent:** Acetonitrile and *Buffer* (1:1)

**Standard solution:** 0.1 mg/mL of USP Cortisone Acetate RS in *Diluent*, prepared as follows. Transfer 25 mg of USP Cortisone Acetate RS to a 250-mL volumetric flask, and dissolve in 100 mL of *Diluent*. Sonicate until a clear solution is obtained, and dilute with *Diluent* to volume.

**Sample solution:** 0.1 mg/mL of Cortisone Acetate in *Diluent*, prepared as follows. Transfer 25 mg of Cortisone Acetate to a 250-mL volumetric flask, and dissolve in 100 mL of *Diluent*. Sonicate until a clear solution is obtained, and dilute with *Diluent* to volume.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; 10-µm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Column efficiency:** NLT 1500 theoretical plates

**Tailing factor:** NMT 2.0

**Capacity factor, *k'*:** NLT 2.0

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cortisone acetate ( $C_{23}H_{30}O_6$ ) in the portion of Cortisone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cortisone Acetate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cortisone Acetate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–102.0% on the dried basis

### IMPURITIES

• **RESIDUE ON IGNITION (281):** Negligible, from 100 mg

#### • ORGANIC IMPURITIES

**Solution A:** Acetonitrile and water (3:7)

**Solution B:** Acetonitrile and water (7:3)

**Mobile phase:** See *Table 1*.

**Table 1**

Time (min)	Solution A (%)	Solution B (%)
0	90	10
5	90	10
25	10	90
30	10	90
31	90	10
51	90	10

**Diluent:** A filtered mixture of acetonitrile, glacial acetic acid, and water (7: 0.1: 3)

**Standard solution:** 20 µg/mL of USP Cortisone Acetate RS in *Diluent*

**Sample solution:** 2.5 mg/mL of Cortisone Acetate in *Diluent*. Sonicate to dissolve.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 15-cm; packing L1

**Flow rate:** 1 mL/min

**Injection volume:** 15 µL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Relative standard deviation:** NMT 5.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Cortisone Acetate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of the major peak from the *Standard solution*

$C_S$  = concentration of USP Cortisone Acetate RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Cortisone Acetate in the *Sample solution* (mg/mL)

#### Acceptance criteria

**Any individual impurity:** NMT 1.5%

**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

#### • OPTICAL ROTATION, *Specific Rotation* (781S)

**Sample solution:** 10 mg/mL in dioxane

**Acceptance criteria:** +208° to +217°

#### • LOSS ON DRYING (731)

**Sample:** Dry a sample at 105° for 30 min.

**Acceptance criteria:** NMT 1.0%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.
- **USP REFERENCE STANDARDS** (11)  
USP Cortisone Acetate RS

---

**Cortisone Acetate Injectable Suspension**

---

» Cortisone Acetate Injectable Suspension is a sterile suspension of Cortisone Acetate in a suitable aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cortisone acetate ( $C_{23}H_{30}O_6$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—  
USP Cortisone Acetate RS

**Identification**—Mix 25 mL of water with a volume of Injectable Suspension equivalent to about 25 mg of cortisone acetate. Centrifuge, or allow the insoluble material to settle, then decant and discard the supernatant. Add 20 mL of methanol and, using agitation and warming as necessary, dissolve the residue. Evaporate the solvent on a steam bath with the aid of a current of air, then dry the residue at 105° for 30 minutes; the residue so obtained responds to *Identification test A* under *Cortisone Acetate*.

**pH** (791): between 5.0 and 7.0.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase*—Prepare as directed in the *Assay* under *Cortisone Acetate Tablets*.

*Internal standard solution*—Prepare a solution of prednisone in *Mobile phase* having a concentration of 0.5 mg per mL.

*Standard preparation*—Transfer about 12 mg of USP Cortisone Acetate RS, accurately weighed, to a stoppered, 50-mL conical flask. Add 20.0 mL of *Internal standard solution*, and sonicate for 5 minutes. Pass a portion through a polytetrafluoroethylene syringe filter, then combine 1 mL of the filtrate and 4 mL of *Mobile phase* to obtain the *Standard preparation*.

*Resolution solution*—Dissolve a quantity of hydrocortisone acetate in the *Standard preparation* to obtain a solution containing about 0.1 mg of hydrocortisone acetate per mL.

*Assay preparation*—Using a pipet calibrated “to contain,” transfer 2.0 mL of freshly mixed Injectable Suspension to a volumetric flask of a size to give a cortisone acetate concentration of 2 mg per mL when diluted to volume. Rinse the suspension remaining in the pipet into the flask with isopropyl alcohol, dilute with isopropyl alcohol to volume, and sonicate for 3 minutes. Deliver a 3.0-mL aliquot of this solution to a stoppered, 25-mL conical flask, and evaporate on a steam bath with the aid of a current of air to dryness. Add 10.0 mL of *Internal standard solution*, insert the stopper, and sonicate for 5 minutes. Pass a portion through a polytetrafluoroethylene syringe filter, then combine approximately 1 mL of the filtrate and 4 mL of *Mobile phase* to obtain the *Assay preparation*.

**Chromatographic system** (see *Chromatography* (621))—Prepare as directed in the *Assay* under *Cortisone Acetate Tablets*. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between cortisone acetate and hydrocortisone acetate is not less than 2.2 (if necessary, add equal parts of *n*-butyl chlo-

ride and water-saturated *n*-butyl chloride to the *Mobile phase* to meet this requirement). Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are 0.6 for cortisone acetate and 1.0 for prednisone; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Proceed as directed in the *Assay* under *Cortisone Acetate Tablets*. Calculate the quantity, in mg, of cortisone acetate ( $C_{23}H_{30}O_6$ ) in each mL of the Injectable Suspension taken by the formula:

$$W(V/12)(R_U/R_S)$$

in which  $V$  is the capacity, in mL, of the volumetric flask used for the *Assay preparation*; and the other terms are as defined therein.

---

**Cortisone Acetate Tablets**

---

**DEFINITION**

Cortisone Acetate Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of cortisone acetate ( $C_{23}H_{30}O_6$ ).

**IDENTIFICATION**

- **A. INFRARED ABSORPTION** (197K)

**Sample:** Powder a number of Tablets equivalent to 25 mg of cortisone acetate. Add 25 mL of solvent hexane, and extract for 15 min with occasional agitation. Decant and discard the supernatant, then extract the residue with 5 mL of chloroform, with frequent agitation, for 5 min. Filter, add 10 mL of methanol to the filtrate, mix, evaporate the solvent on a steam bath with the aid of a current of air, then dry the residue at 105° for 30 min. Use the residue.

**Acceptance criteria:** Meet the requirements

**ASSAY**

- **PROCEDURE**

**Mobile phase:** *n*-Butyl chloride, water-saturated *n*-butyl chloride, tetrahydrofuran, methanol, and glacial acetic acid (95:95:14:7:6)

**Internal standard solution:** 0.04 mg/mL of methylparaben in *Mobile phase*

**Standard stock solution:** Transfer 12 mg of USP Cortisone Acetate RS to a glass-stoppered, 50-mL conical flask, add 25.0 mL of the *Internal standard solution*, and sonicate for 5 min.

**Standard solution:** Nominally 0.12 mg/mL of USP Cortisone Acetate RS, prepared by combining 1 mL of the *Standard stock solution* with 3 mL of *Mobile phase*

**System suitability solution:** 0.1 mg/mL of hydrocortisone acetate in the *Standard solution*

**Sample stock solution:** Weigh, then finely powder NLT 20 Tablets. Transfer a portion of the powder, nominally equivalent to 12 mg of cortisone acetate, to a stoppered conical flask. Add 25.0 mL of the *Internal standard solution*, insert the stopper into the flask, and sonicate vigorously for 5 min. Pass a portion through a polytetrafluoroethylene syringe filter.

**Sample solution:** 0.12 mg/mL of cortisone acetate, prepared by combining 1 mL of the *Sample stock solution* filtrate and 3 mL of *Mobile phase*

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L3

**Flow rate:** 1 mL/min

**Injection volume:** 15  $\mu$ L

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for methylparaben and cortisone acetate are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.2 between cortisone acetate and hydrocortisone acetate, *System suitability solution*. If necessary, add equal parts of *n*-butyl chloride and water-saturated *n*-butyl chloride to the *Mobile phase* to meet this requirement.

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cortisone acetate ( $C_{23}H_{30}O_6$ ) in the portion of Tablets taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of cortisone acetate to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of cortisone acetate to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Cortisone Acetate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cortisone acetate in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

• **DISSOLUTION** <711>

**Medium:** 0.5% sodium lauryl sulfate solution; 1000 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Standard solution:** 5.55  $\mu$ g/mL of USP Cortisone Acetate RS in *Medium*

**Sample solution:** Pass a portion of the solution under test through a suitable filter. Dilute with *Medium*, if necessary.

**Instrumental conditions**

**Mode:** UV

**Analytical wavelength:** Maximum absorbance at about 242 nm

**Cell size:** 1 cm

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

**Tolerances:** NLT 75% (Q) of the labeled amount of cortisone acetate ( $C_{23}H_{30}O_6$ ) is dissolved.

• **UNIFORMITY OF DOSAGE UNITS** (905)

**Procedure for content uniformity**

**Mobile phase, Internal standard solution, Standard solution, System suitability solution, Chromatographic system, and System suitability:** Proceed as directed in the *Assay*.

**Sample stock solution:** Place 1 Tablet in a stoppered, 50-mL conical flask, deposit 0.25 mL of water onto the Tablet, insert the stopper into the flask, and allow to stand for 30 min. Add 2.5 mL of isopropyl alcohol, and place the unstoppered flask on a steam bath. Boil gently, if necessary, until the Tablet disintegrates, then evaporate the solvent with the aid of a current of air. Remove from the steam bath, add 10.0 mL of the *Internal standard solution* for each 5 mg of cortisone acetate declared, insert the stopper, and sonicate vigorously for 10 min. Pass a portion through a polytetrafluoroethylene syringe filter.

**Sample solution:** Combine 1 mL of the *Sample stock solution* filtrate and 3 mL of *Mobile phase*.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cortisone acetate ( $C_{23}H_{30}O_6$ ) in the Tablet taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of cortisone acetate to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of cortisone acetate to the internal standard from the *Standard solution*

$C_S$  = concentration of USP Cortisone Acetate RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cortisone acetate in the *Sample solution* (mg/mL)

**Acceptance criteria:** Meet the requirements

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers.

• **USP REFERENCE STANDARDS** <11>  
USP Cortisone Acetate RS

## Purified Cotton

» Purified Cotton is the hair of the seed of cultivated varieties of *Gossypium hirsutum* Linné, or of other species of *Gossypium* (Fam. Malvaceae), freed from adhering impurities, deprived of fatty matter, bleached, and sterilized in its final container.

**Packaging and storage**—Package it in rolls of not more than 500 g of a continuous lap, with a light-weight paper running under the entire lap, the paper being of such width that it may be folded over the edges of the lap to a distance of at least 25 mm, the two together being tightly and evenly rolled, and enclosed and sealed in a well-closed container. It may be packaged also in other types of containers if these are so constructed that the sterility of the product is maintained.

**Labeling**—Its label bears a statement to the effect that the sterility cannot be guaranteed if the package bears evidence of damage or if the package has been opened previously.

**Sterility** <71>: meets the requirements.

**Acidity or alkalinity**—Thoroughly saturate about 10 g with 100 mL of recently boiled and cooled water, then with the aid of a glass rod press out two 25-mL portions of the water into white porcelain dishes. To one portion add 3 drops of phenolphthalein TS, and to the other portion add 1 drop of methyl orange TS: no pink color develops in either portion.

**Residue on ignition** <281>—Place about 5 g, accurately weighed, in a porcelain or platinum dish, and moisten with 2 N sulfuric acid. Gently heat the cotton until it is charred, then ignite more strongly until the carbon is completely consumed: not more than 0.20% of residue remains.

**Water-soluble substances**—Place 10 g, accurately weighed, in a beaker containing 1000 mL of water, and boil gently for 30 minutes, adding water as required to maintain the volume. Pour the water through a funnel into another vessel, and press out the excess water from the cotton with a glass rod. Wash the cotton in the funnel with two 250-mL portions of boiling water, pressing the cotton after each washing. Filter the combined extract and washings, and wash the filter thoroughly with hot water. Evaporate the combined extract and washings to a small volume, transfer to a tared porcelain or platinum dish, evaporate to dryness,

and dry the residue at 105° to constant weight: the residue weighs not more than 35 mg (0.35%).

**Fatty matter**—Pack 10 ± 0.01 g in a Soxhlet extractor provided with a tared receiver, and extract with ether for 5 hours at a rate such that the ether siphons over not less than four times per hour. The ether solution in the flask shows no trace of blue, green, or brownish color. Evaporate the extract to dryness, and dry at 105° for 1 hour: the weight of the residue does not exceed 70 mg (0.7%).

**Dyes**—Pack about 10 g in a narrow percolator, and extract slowly with alcohol until the percolate measures 50 mL: when observed downward through a column 20 cm in depth, the percolate may show a yellowish color, but neither a blue nor a green tint.

**Other foreign matter**—The pinches of it taken for the determination of *Fiber length* contain no oil stains or metallic particles.

**Fiber length and Absorbency**—Remove it from its wrappings, and condition it for not less than 4 hours in a standard atmosphere of 65 ± 2% relative humidity at 21 ± 1.1° (70 ± 2°F), before determining the *Fiber length* and *Absorbency*.

**Fiber length**—Determine the fiber length of Purified Cotton as directed under *Cotton—Fiber Length* (691): not less than 60% of the fibers, by weight, are 12.5 mm or greater in length, and not more than 10% of the fibers, by weight, are 6.25 mm or less in length.

**Absorbency**—Proceed as directed under *Cotton—Absorbency Test* (691): submersion is complete in 10 seconds at a temperature of 25°, and the cotton retains not less than 24 times its weight of water.

## Cromolyn Sodium

C<sub>23</sub>H<sub>14</sub>Na<sub>2</sub>O<sub>11</sub> 512.33

4*H*-1-Benzopyran-2-carboxylic acid, 5,5'-[(2-hydroxy-1,3-propanediyl)bis(oxy)bis[4-oxo-, disodium salt].

Disodium 5,5'-[(2-hydroxytrimethylene)dioxy]bis[4-oxo-4*H*-1-benzopyran-2-carboxylate] [15826-37-6].

» Cromolyn Sodium contains not less than 98.0 percent and not more than 101.0 percent of C<sub>23</sub>H<sub>14</sub>Na<sub>2</sub>O<sub>11</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cromolyn Sodium RS

**Identification**—

**A:** The IR absorption spectrum of a potassium bromide dispersion of it, previously dried in vacuum at 105° to constant weight, exhibits maxima only at the same wavelengths as that of a similar preparation of USP Cromolyn Sodium RS.

**B:** The UV absorption spectrum of a 1 in 40,000 solution in *pH 7.4 sodium phosphate buffer* prepared as directed in the *Assay* exhibits maxima at the same wavelengths as that of a similar solution of USP Cromolyn Sodium RS, concomitantly measured.

**Acidity or alkalinity**—Dissolve 1.0 g in 25 mL of carbon dioxide-free water, and add two drops of bromothymol blue TS. If the solution is yellow, not more than 0.25 mL of 0.1 N sodium hydroxide is required to produce a blue color. If the solution is blue, not more than 0.25 mL of 0.1 N hydrochloric acid is required to produce a yellow color.

**Water**, *Method I* (921): not more than 10.0%.

**Heavy metals**, *Method II* (231): 0.002%.

**Limit of oxalate**—Dissolve 100 mg in 20 mL of water, add 5.0 mL of iron salicylate TS, and dilute with water to 50 mL. Determine the absorbance of the solution at 480 nm against a water blank. The absorbance is not less than that of a solution containing 350 µg of oxalic acid prepared in the same manner (0.35%).

**Related compounds**—Dissolve 100 mg of Cromolyn Sodium in 10.0 mL of a mixture of water, stabilizer-free tetrahydrofuran, and acetone (6:4:1). Similarly prepare a solution of USP Cromolyn Sodium RS in the same solvent mixture having a concentration of 10 mg per mL (*Standard solution A*). Quantitatively dilute a volume of *Standard solution A* with the same solvent mixture to obtain a diluted standard solution having a concentration of 0.05 mg per mL (*Standard solution B*). Apply 10-µL portions of the test solution, *Standard solution A*, and *Standard solution B* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and glacial acetic acid (9:9:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: the *R<sub>f</sub>* value of the principal spot obtained from the test solution corresponds to that obtained from *Standard solution A*. Any spot in the chromatogram obtained from the test solution moving ahead of the principal spot is not more intense than the spot in the chromatogram obtained from *Standard solution B* (0.5%).

**Assay**—

*pH 7.4 Sodium phosphate buffer*—Dissolve 70 g of anhydrous dibasic sodium phosphate in 900 mL of water. Adjust to a pH of 7.4 by the addition of dilute phosphoric acid (1 in 10). Dilute with water to 1000 mL, and mix. Transfer 10 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cromolyn Sodium RS in water to obtain a solution having a known concentration of about 250 µg per mL. Transfer 10 mL of this solution to a 100-mL volumetric flask, add 1 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix. The final concentration is about 25 µg per mL.

**Assay preparation**—Transfer about 100 mg of Cromolyn Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in about 100 mL of water, dilute with water to volume, and mix. Pipet 25 mL of this solution into a 100-mL volumetric flask, add 1 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 326 nm, with a suitable spectrophotometer, using a 1 in 100 solution of *pH 7.4 Sodium phosphate buffer* as the blank. Calculate the quantity, in mg, of C<sub>23</sub>H<sub>14</sub>Na<sub>2</sub>O<sub>11</sub> in the Cromolyn Sodium taken by the formula:

$$4C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Cromolyn Sodium RS in the *Standard preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Cromolyn Sodium Inhalation Powder

» Cromolyn Sodium Inhalation Powder is a mixture of equal parts of Lactose and Cromolyn Sodium contained in a hard gelatin capsule. It contains not less than 95.0 percent and not more than 125.0 percent of the labeled amount of cromolyn sodium ( $C_{23}H_{14}Na_2O_{11}$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature. Avoid excessive heat.

### USP Reference standards (11)—

USP Cromolyn Sodium RS

**Identification**—It meets the requirements of *Identification test B* under *Cromolyn Sodium*.

**Uniformity of dosage units** (905): meets the requirements.

### Assay—

*pH 7.4 Sodium phosphate buffer*—Prepare as directed in the *Assay* under *Cromolyn Sodium*.

*Assay preparation*—Remove and accurately weigh the contents of not fewer than 20 capsules of Cromolyn Sodium Inhalation Powder, and transfer the combined contents to a 250-mL volumetric flask. Dissolve in 100 mL of water, dilute with water to volume, and mix. Transfer an aliquot of this solution, equivalent to 8 mg of cromolyn sodium, to a 250-mL volumetric flask, add 1 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix.

*Standard preparation*—Dissolve a suitable quantity of USP Cromolyn Sodium RS, previously dried in vacuum at 105° to constant weight and accurately weighed, in water to obtain a solution having a known concentration of about 350 µg per mL. Transfer 10 mL of this solution to a 100-mL volumetric flask, add 1 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix. The final concentration is about 35 µg per mL.

*Procedure*—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 326 nm, with a suitable spectrophotometer, using a solution of *pH 7.4 Sodium phosphate buffer* (1 in 250) as the blank. Calculate the quantity, in mg, of cromolyn sodium ( $C_{23}H_{14}Na_2O_{11}$ ) in the aliquot taken by the formula:

$$0.25C(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Cromolyn Sodium RS in the *Standard preparation*; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Cromolyn Sodium Inhalation Solution

» Cromolyn Sodium Inhalation Solution is a sterile, aqueous solution of Cromolyn Sodium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{23}H_{14}Na_2O_{11}$ .

**Packaging and storage**—Preserve in single-unit double-ended glass ampuls or in low-density polyethylene ampuls.

**Labeling**—The label indicates that the Inhalation Solution is not to be used if it contains a precipitate.

### USP Reference standards (11)—

USP Cromolyn Sodium RS

**Identification**—The UV absorption spectrum of the *Assay preparation* prepared as directed in the *Assay* exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Cromolyn Sodium RS, concomitantly measured.

**Sterility** (71): meets the requirements.

**Uniformity of dosage units** (905): meets the requirements.

**pH** (791): between 4.0 and 7.0.

**Related compounds**—Apply 10-µL portions of Inhalation Solution and Standard solutions of USP Cromolyn Sodium RS in a mixture of water, stabilizer-free tetrahydrofuran, and acetone (6:4:1) containing 10 mg per mL (*Standard solution A*) and 0.1 mg per mL (*Standard solution B*) to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, methanol, and glacial acetic acid (9:9:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: the *R<sub>f</sub>* value of the principal spot obtained from the Inhalation Solution corresponds to that obtained from *Standard solution A*. Any spot in the chromatogram obtained from the Inhalation Solution moving ahead of the principal spot is not more intense than the spot in the chromatogram obtained from *Standard solution B* (1.0%).

### Assay—

*pH 7.4 Sodium phosphate buffer* and *Standard preparation*—Prepare as directed in the *Assay* under *Cromolyn Sodium*.

*Assay preparation*—Dilute with water an accurately measured volume of Inhalation Solution, equivalent to about 25 mg of cromolyn sodium, to obtain a solution having a concentration of about 250 µg per mL. Pipet 10 mL of this solution into a 100-mL volumetric flask, add 1 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix.

*Procedure*—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 326 nm, with a suitable spectrophotometer, using a 1 in 100 aqueous solution of *pH 7.4 Sodium phosphate buffer* as the blank. Calculate the quantity, in mg, of  $C_{23}H_{14}Na_2O_{11}$  in each mL of the Inhalation Solution taken by the formula:

$$(C/V)(A_U / A_S)$$

in which *C* is the concentration, in µg per mL, of USP Cromolyn Sodium RS in the *Standard preparation*; *V* is the volume, in mL, of Inhalation Solution taken; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cromolyn Sodium Nasal Solution

» Cromolyn Sodium Nasal Solution is an aqueous solution of Cromolyn Sodium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{23}H_{14}Na_2O_{11}$ . It may contain suitable stabilizers.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Cromolyn Sodium RS

**Identification**—It meets the requirements for *Identification* test B under *Cromolyn Sodium*.

**pH** (791): between 4.0 and 7.0.

**Related compounds**—It meets the requirements of the test for *Related compounds* under *Cromolyn Sodium Inhalation Solution*, “Nasal Solution” being read in place of “Inhalation Solution.”

**Assay**—

*pH 7.4 Sodium phosphate buffer*—Prepare as directed in the *Assay* under *Cromolyn Sodium*.

*Assay preparation*—Transfer 4 mL of Nasal Solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer an aliquot of this solution, equivalent to 8 mg of cromolyn sodium, to a 250-mL volumetric flask. Add 2.5 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix.

*Standard preparation*—Prepare as directed in the *Assay* under *Cromolyn Sodium*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cromolyn Sodium Inhalation Solution*.

## Cromolyn Sodium Ophthalmic Solution

» Cromolyn Sodium Ophthalmic Solution is a sterile, aqueous solution of Cromolyn Sodium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{23}H_{14}Na_2O_{11}$ . It may contain suitable antimicrobial and stabilizing agents.

**Packaging and storage**—Preserve in tight, light-resistant, single-dose or multiple-dose containers. Ophthalmic Solution that is packaged in multiple-dose containers contains a suitable antimicrobial agent.

**USP Reference standards** (11)—

USP Cromolyn Sodium RS

**Identification**—It meets the requirements for *Identification* test B under *Cromolyn Sodium*.

**Sterility** (71): meets the requirements.

**pH** (791): between 4.0 and 7.0.

**Related compounds**—It meets the requirements of the test for *Related compounds* under *Cromolyn Sodium Inhalation Solution*, “Ophthalmic Solution” being read in place of “Inhalation Solution.”

**Assay**—

*pH 7.4 Sodium phosphate buffer*—Prepare as directed in the *Assay* under *Cromolyn Sodium*.

*Assay preparation*—Transfer 4 mL of Ophthalmic Solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer an aliquot of this solution, equivalent to 8 mg of cromolyn sodium, to a 250-mL volumetric flask. Add 2.5 mL of *pH 7.4 Sodium phosphate buffer*, dilute with water to volume, and mix.

*Standard preparation*—Prepare as directed in the *Assay* under *Cromolyn Sodium*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cromolyn Sodium Inhalation Solution*.

## Crotamiton

$C_{13}H_{17}NO$  203.28

2-Butenamide, *N*-ethyl-*N*-(2-methylphenyl)-.

*N*-Ethyl-*o*-crotonotoluidide [483-63-6].

» Crotamiton is a mixture of *cis* and *trans* isomers containing not less than 97.0 percent and not more than 103.0 percent of  $C_{13}H_{17}NO$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Crotamiton RS

**Identification**—

**A: Infrared Absorption** (197F).

**B: Ultraviolet Absorption** (197U)—

*Solution*: 20  $\mu$ g per mL.

*Medium*: cyclohexane.

**C**: To about 10 mL of a saturated solution in water add a few drops of potassium permanganate TS: a brown color is produced, and a brown precipitate is formed on standing.

**Specific gravity** (841): between 1.008 and 1.011 at 20°.

**Refractive index** (831): between 1.540 and 1.543 at 20°.

**Residue on ignition** (281): not more than 0.1%.

**Bound halogen**—Place 4 drops in a 3-mm (ID) test tube, and add calcium oxide to a height of 1 cm. Heat the tube in a flame, starting from the top, until the reaction is complete, then ignite for a short time. Transfer the contents to a beaker containing 10 mL of water, acidify with nitric acid, and filter. To the filtrate add 0.2 mL of silver nitrate solution (1 in 60): any opalescence obtained is not more than that obtained from a blank solution treated in the same manner.

**Assay**—Transfer about 50 mg of Crotamiton, accurately weighed, to a 100-mL volumetric flask, add cyclohexane to volume, and mix. Transfer 10.0 mL of this solution to a 250-mL volumetric flask, dilute with cyclohexane to volume, and mix. Determine the absorbance of this solution and of a solution of USP Crotamiton RS in the same medium having a known concentration of about 20  $\mu$ g per mL in 1-cm cells at the wavelength of maximum absorbance at about 242 nm, with a suitable spectrophotometer, using cyclohexane as the blank. Calculate the quantity, in mg, of  $C_{13}H_{17}NO$  in the Crotamiton taken by the formula:

$$2.5C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Crotamiton RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the assay solution and the Standard solution, respectively.

## Crotamiton Cream

» Crotamiton Cream contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{13}H_{17}NO$ .

**Packaging and storage**—Preserve in collapsible tubes or tight, light-resistant containers.

**USP Reference standards** (11)—

USP Crodamiton RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay preparation*.

**Minimum fill** (755): meets the requirements.

**Assay**—

*Internal standard solution*—Dissolve butyl benzoate in methanol to obtain a solution containing about 17.5 mg per mL.

*Mobile phase*—Prepare a suitable degassed and filtered mixture of acetonitrile and water (3:2).

*Standard solution*—Dissolve a suitable quantity of USP Crodamiton RS, accurately weighed, in methanol to obtain a solution having a known concentration of about 1 mg per mL.

*Standard preparation*—Pipet 10 mL of *Standard solution* and 5 mL of *Internal standard solution* into a 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Assay preparation*—Transfer an accurately weighed portion of Crodamiton Cream, equivalent to about 50 mg of crodamiton, to a tared 50-mL volumetric flask. Add about 25 mL of methanol, and shake and sonicate to disperse the cream. Dilute with methanol to volume, and mix. Filter about 20 mL through moderately retentive filter paper. Pipet 10 mL of the clear filtrate and 5 mL of *Internal standard solution* into a 50-mL volumetric flask, dilute with methanol to volume, and mix.

*Procedure*—Inject equal volumes of the *Standard preparation* and the *Assay preparation* into a liquid chromatograph (see *Chromatography* (621)) equipped with a 254-nm detector and a 4.6-mm × 25-cm stainless steel column that contains packing L1. In a suitable chromatogram, the resolution,  $R$ , between peaks for crodamiton and butyl benzoate is not less than 3.0; and the lowest and highest peak response ratios ( $R_s$ ) of three replicate injections of the *Standard preparation* agree within 2.0%. Calculate the quantity, in mg, of  $C_{13}H_{17}NO$  in the portion of Cream taken by the formula:

$$250C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Crodamiton RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the crodamiton peak and the butyl benzoate peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Cupric Chloride**

$CuCl_2 \cdot 2H_2O$  170.48

$CuCl_2$  134.45

Copper chloride ( $CuCl_2$ ) dihydrate;  
Copper(2+) chloride dihydrate [10125-13-0].  
Anhydrous [7447-39-4].

**DEFINITION**

Cupric Chloride contains NLT 99.0% and NMT 100.5% of  $CuCl_2$ , calculated on the dried basis.

**IDENTIFICATION**

- **A. IDENTIFICATION TESTS—GENERAL, Chloride** (191): A solution (1 in 20) meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Copper** (191): A solution (1 in 20) meets the requirements.

**ASSAY**• **PROCEDURE**

**Sample solution:** 8 mg/mL of Cupric Chloride in water

**Analysis:** To the *Sample solution* add 4 mL of acetic acid and 3 g of potassium iodide. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding 2 g of potassium thiocyanate and 3 mL of starch TS as the endpoint is approached. Each mL of 0.1 N sodium thiosulfate is equivalent to 13.45 mg of Cupric Chloride ( $CuCl_2$ ).

**Acceptance criteria:** 99.0%–100.5% on the dried basis

**IMPURITIES**• **LIMIT OF SODIUM**

**Sample stock solution:** Transfer 10.0 g of Cupric Chloride to a 100-mL volumetric flask, add water, and swirl to dissolve. Add 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.1 g/mL of cupric chloride.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of the *Sample stock solution* equivalent to the *Sample Weight* given in Table 1. To two of the flasks add the amounts of reference analyte ion specified in Table 1. Add 2 mL of potassium chloride solution (1 in 20) to each flask, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* (851)), analyze the *Sample solutions* by the method of standard addition analysis according to Table 1.

**Acceptance criteria:** NMT 0.02%

Table 1

Limit Test	Wave-length (nm)	Sample Weight (g)	Reference Ion Added (mg)	Flame Type	Background Correction
Sodium	589.0	0.1	0.01/0.02	Air-acetylene	No
Potassium	766.5	0.1	0.01/0.02	Air-acetylene	No
Calcium	422.7	2.0	0.05/0.10	Air-acetylene	No
Iron	248.3	2.0	0.05/0.10	Air-acetylene	Yes
Nickel	232.0	2.0	0.10/0.20	Air-acetylene	No

• **LIMIT OF POTASSIUM**

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of the *Sample stock solution* equivalent to the *Sample Weight* given in Table 1. To two of the flasks add the amounts of reference analyte ion specified in Table 1, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* (851)), analyze the *Sample solutions* by the method of standard addition analysis according to Table 1.

**Acceptance criteria:** NMT 0.01%

• **LIMIT OF CALCIUM**

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of the *Sample stock solution* equivalent to the *Sample Weight* given in Table 1. To two of the flasks add the amounts of reference analyte ion specified in Table 1, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis according to *Table 1*.

**Acceptance criteria:** NMT 0.005%

• **LIMIT OF IRON**

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of the *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis according to *Table 1*.

**Acceptance criteria:** NMT 0.005%

• **LIMIT OF NICKEL**

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of the *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis according to *Table 1*.

**Acceptance criteria:** NMT 0.01%

• **INSOLUBLE MATTER**

**Sample:** 10 g of Cupric Chloride

**Analysis:** Transfer the *Sample* to a 250-mL beaker. Add 100 mL of water and 2 mL of hydrochloric acid. Cover the beaker, and heat to boiling. Digest the hot solution on a steam bath for 1 h, and pass through a tared, filtering crucible of fine-pore size. Rinse the beaker with hot water, passing the rinsings through the filter, and finally wash the filter with additional hot water. Retain the combined filtrate and washings for the test for *Limit of Sulfate*. Dry the filter at 105°.

**Acceptance criteria:** The residue weighs NMT 1.0 mg (0.01%).

• **LIMIT OF SULFATE**

**Analysis:** Heat to boiling the combined filtrate and washings retained from the test for *Insoluble Matter*. Add 10 mL of barium chloride TS, digest for 2 h on a steam bath, and allow to stand overnight. Pass the solution through a tared, porcelain filtering crucible of medium-pore size, and wash the residue with two 10-mL portions of hot water. Ignite at 800 ± 25° to constant weight.

**Acceptance criteria:** The weight of the residue, corrected for the weight obtained in a blank test, does not exceed 1.2 mg (0.005%).

**SPECIFIC TESTS**

- **LOSS ON DRYING** <731>: Dry a sample at 105° for 16 h: it loses 20.9%–21.4% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

## Cupric Chloride Injection

**DEFINITION**

Cupric Chloride Injection is a sterile solution of Cupric Chloride in Water for Injection. It contains NLT 90.0% and NMT 110.0% of the labeled amount of copper (Cu).

**IDENTIFICATION**

- **A.** The *Sample solution* exhibits an absorption maximum at about 325 nm when prepared and tested as directed in the *Assay*.

**ASSAY**

• **PROCEDURE**

**Sodium chloride solution:** 1.35 g/L of sodium chloride

**Standard stock solution:** Transfer 1.000 g of copper to a 1000-mL volumetric flask, dissolve in 20 mL of nitric acid, and dilute with 0.2 N nitric acid to volume. This solution contains 1000 µg/mL of copper. Store in a polyethylene bottle.

**Standard solutions:** Pipet 15 mL of *Standard stock solution* into a 250-mL volumetric flask, dilute with water to volume, and mix. Transfer 4.0, 5.0, and 6.0 mL of this solution to separate 100-mL volumetric flasks containing 10 mL of *Sodium chloride solution*, dilute the contents of each flask with water to volume, and mix.

These *Standard solutions* contain 2.4, 3.0, and 3.6 µg of copper per mL, respectively.

**Sample stock solution:** Transfer a volume of Injection, equivalent to 2 mg of copper, into 100 mL of water.

**Sample solution:** Pipet 15 mL of the *Sample stock solution* into a 100-mL volumetric flask. From the labeled amount of sodium chloride, if any, in the Injection, calculate the amount, in mg, of sodium chloride in the initial dilution, and add sufficient *Sodium chloride solution* to bring the total sodium content of this flask to 13.5 mg. Dilute with water to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** Atomic absorption

**Analytical wavelength:** 324.8 nm (copper emission line)

**Lamp:** Copper hollow-cathode

**Flame:** Air-acetylene

**Blank:** *Sodium chloride solution* and water (1 in 10)

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*  
Plot the absorbances of the *Standard solutions* versus concentration, in µg/mL, of copper, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration, *C*, in µg/mL, of copper in the *Sample solution*.

Calculate the percentage of copper in the portion of Injection taken:

$$\text{Result} = [(C/V) \times F \times V_1 \times D] \times (100/L)$$

*C* = concentration of copper in the *Sample solution* (µg/mL)

*V* = volume of Injection (mL)

*F* = conversion factor from µg to mg, 1/1000

*V*<sub>1</sub> = volume of the *Sample stock solution*, 100 mL

*D* = dilution factor from the *Sample solution*, 100/15

*L* = label claim (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

- **PH** <791>: 1.5–2.5
- **BACTERIAL ENDOTOXINS TEST** <85>: It contains NMT 250.0 USP Endotoxin Units/mg of copper.
- **PARTICULATE MATTER IN INJECTIONS** <788>: Meets the requirements for small-volume injections
- **OTHER REQUIREMENTS:** Meets the requirements in *Injections* <1>

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.
- **LABELING:** Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid before administration.

- **USP REFERENCE STANDARDS** <11>  
USP Endotoxin RS

## Cupric Sulfate

$\text{CuSO}_4 \cdot 5\text{H}_2\text{O}$  249.69

$\text{CuSO}_4$  159.61

Sulfuric acid, copper(2+) salt (1:1), pentahydrate;  
Copper(2+) sulfate (1:1) pentahydrate [7758-99-8].  
Anhydrous [7758-98-7].

### DEFINITION

Cupric Sulfate, dried at 250° to constant weight, contains NLT 98.5% and NMT 100.5 % of  $\text{CuSO}_4$ .

### IDENTIFICATION

- **A. IDENTIFICATION TESTS—GENERAL, Sulfate** <191>: A solution (1 in 10) meets the requirements.
- **B. IDENTIFICATION TESTS—GENERAL, Copper** <191>: A solution (1 in 10) meets the requirements.

### ASSAY

#### PROCEDURE

**Sample solution:** Place 650 mg of Cupric Sulfate in a weighed container fitted with a ground-glass stopper. Dry, allow to cool in a desiccator, and weigh again to obtain the weight of the sample. Dissolve in 50 mL of water.

**Analysis:** To the *Sample solution* add 4 mL of 6 N acetic acid and 3 g of potassium iodide. Titrate the liberated iodine with 0.1 N sodium thiosulfate VS, adding about 2 g of potassium thiocyanate and 3 mL of starch TS as the endpoint is approached. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 15.96 mg of cupric sulfate ( $\text{CuSO}_4$ ).

**Acceptance criteria:** 98.5%–100.5% on the dried basis

### IMPURITIES

#### LIMIT OF SODIUM

**Sample stock solution:** Transfer 40.0 g of Cupric Sulfate to a 200-mL volumetric flask, add water, and swirl to dissolve. Add 5 mL of nitric acid, and dilute with water to volume. This solution contains 0.2 g/mL of cupric sulfate.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*. Add 2 mL of potassium chloride solution (1 in 20) to each flask, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis given in *Table 1*.

**Acceptance criteria:** NMT 0.02%

Table 1

Limit Test	Wave-length (nm)	Sample Weight (g)	Reference Ion Added (mg)	Flame Type	Back-ground Cor-rec-tion
Sodium	589.0	0.05	0.005/0.01	Air-acety-lene	No
Potassi-um	766.5	0.4	0.02/0.04	Air-acety-lene	No

Table 1 (Continued)

Limit Test	Wave-length (nm)	Sample Weight (g)	Reference Ion Added (mg)	Flame Type	Back-ground Cor-rec-tion
Calcium	422.7	0.8	0.02/0.04	Nitrous oxide-acety-lene	No
Iron	248.3	4.0	0.12/0.24	Air-acety-lene	Yes
Nickel	232.0	4.0	0.10/0.20	Air-acety-lene	No

#### LIMIT OF POTASSIUM

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis given in *Table 1*.

**Acceptance criteria:** NMT 0.01%

#### LIMIT OF CALCIUM

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis given in *Table 1*.

**Acceptance criteria:** NMT 0.005%

#### LIMIT OF IRON

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis given in *Table 1*.

**Acceptance criteria:** NMT 0.003%

#### LIMIT OF NICKEL

**Sample stock solution:** Prepare as directed in the test for *Limit of Sodium*.

**Sample solutions:** To three 25-mL volumetric flasks add a volume of *Sample stock solution* equivalent to the *Sample Weight* given in *Table 1*. To two of the flasks add the amounts of reference analyte ion specified in *Table 1*, and dilute with water to volume.

**Analysis:** Using atomic absorption spectrophotometry (see *Spectrophotometry and Light-Scattering* <851>), analyze the *Sample solutions* by the method of standard addition analysis given in *Table 1*.

**Acceptance criteria:** NMT 0.005%

### SPECIFIC TESTS

- **LOSS ON DRYING** <731>: Dry a sample at 250° to constant weight: it loses 33.0%–36.5% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store at controlled room temperature.

**Cupric Sulfate Injection**

» Cupric Sulfate Injection is a sterile solution of Cupric Sulfate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of copper (Cu).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type II glass.

**Labeling**—Label the Injection to indicate that it is to be diluted to the appropriate strength with Sterile Water for Injection or other suitable fluid prior to administration.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Identification**—The *Assay preparation*, prepared as directed in the *Assay*, exhibits an absorption maximum at about 325 nm when tested as directed for *Procedure* in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 250.0 USP Endotoxin Units per mg of copper.

**pH** (791): between 2.0 and 3.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay—**

*Sodium chloride solution*, *Copper stock solution*, and *Standard preparations*—Prepare as directed in the *Assay* under *Cupric Chloride Injection*.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 2 mg of copper, to a 100-mL volumetric flask, dilute with water to volume, and mix. Pipet 15 mL of this solution into a 100-mL volumetric flask. From the labeled amount of sodium chloride, if any, in the Injection, calculate the amount, in mg, of sodium chloride in the initial dilution, and add sufficient *Sodium chloride solution* to bring the total sodium content of this flask to 13.5 mg. Dilute with water to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Cupric Chloride Injection*.

**Cyanocobalamin**

$C_{63}H_{88}CoN_{14}O_{14}P$   
Vitamin B<sub>12</sub> [68-19-9].

1355.37

**DEFINITION**

Cyanocobalamin contains NLT 96.0% and NMT 102.0% of cyanocobalamin ( $C_{63}H_{88}CoN_{14}O_{14}P$ ), calculated on the dried basis.

**IDENTIFICATION**

- **A. ULTRAVIOLET ABSORPTION** (197U)

**Wavelength range:** 200–700 nm

**Sample solution:** Prepare as directed in the *Assay*.

**Acceptance criteria:** The absorption spectrum exhibits maxima at  $278 \pm 1$ ,  $361 \pm 1$ , and  $550 \pm 2$  nm. The absorbance ratio  $A_{361}/A_{278}$  is 1.70–1.90, and the absorbance ratio  $A_{361}/A_{550}$  is 3.15–3.40.

- **B.**

**Sample solution:** Fuse 1 mg of Cyanocobalamin with 50 mg of potassium pyrosulfate in a porcelain crucible. Cool, break up the mass with a glass rod, add 3 mL of water, and dissolve by boiling.

**Analysis:** Add 1 drop of phenolphthalein TS, and add sodium hydroxide solution (100 mg/mL), dropwise, until just pink. Add 500 mg of sodium acetate, 0.5 mL of 1 N acetic acid, and 0.5 mL of nitroso R salt solution (2 mg/mL). Add 0.5 mL of hydrochloric acid, and boil for 1 min.

**Acceptance criteria:** A red or orange-red color appears immediately after the addition of nitroso R salt. The red color persists after boiling with the addition of hydrochloric acid.

- **C. HPLC**

**Mobile phase and Chromatographic system:** Proceed as directed in the test for *Related Compounds*.

**Standard solution:** 50 µg/mL of cyanocobalamin from USP Cyanocobalamin RS in *Mobile phase*. Use within 1 h.

**Sample solution:** 50 µg/mL of Cyanocobalamin in *Mobile phase*. Use within 1 h.

**Acceptance criteria:** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*.

**ASSAY**

- **PROCEDURE**

**Standard solution:** 30 µg/mL of cyanocobalamin from USP Cyanocobalamin RS in water

[NOTE—USP Cyanocobalamin RS is a solid dispersion of cyanocobalamin in mannitol. Dissolve and dilute quantitatively and stepwise NLT 30 mg of USP Cyanocobalamin RS to prepare the *Standard solution*.]

**Sample solution:** 30 µg/mL of Cyanocobalamin in water

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** UV

**Analytical wavelength:** 361 nm

**Cell:** 1 cm

**Blank:** Water

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of cyanocobalamin ( $C_{63}H_{88}CoN_{14}O_{14}P$ ) in the portion of Cyanocobalamin taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of cyanocobalamin in the *Standard solution* (µg/mL)

$C_U$  = concentration of Cyanocobalamin in the *Sample solution* (µg/mL)

**Acceptance criteria:** 96.0%–102.0% on the dried basis

**IMPURITIES**

- **RELATED COMPOUNDS**

**Solution A:** 10 g/L of disodium hydrogen phosphate in water

**Mobile phase:** Mixture of methanol and *Solution A* (26.5: 73.5). Adjust with phosphoric acid to a pH of 3.5.

**System suitability solution:** Dissolve 25 mg of Cyanocobalamin in 10 mL of water, warming if necessary. Allow to cool, add 5 mL of a 1.0-g/L solution of tosyl-chloramide sodium and 0.5 mL of 0.05 M hydrochloric acid, and then dilute with water to 25 mL. Shake and allow to stand for 5 min. Dilute 1.0 mL of this solution with *Mobile phase* to 10 mL, and inject immediately.

**Quantitative limit solution:** 1 µg/mL of Cyanocobalamin in *Mobile phase*. Use within 1 h.

**Sample solution:** 1 mg/mL of Cyanocobalamin in *Mobile phase*. Use within 1 h.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 361 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L7

**Column temperature:** 35°

**Flow rate:** 0.8 mL/min

**Injection size:** 20 µL

#### System suitability

**Samples:** *System suitability solution* and *Quantitative limit solution*

[NOTE—The chromatogram of the *System suitability solution* should exhibit two major peaks, cyanocobalamin and 7β,8β-lactocyanocobalamin. The relative retention times for the two peaks are 1.0 and 1.2, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.5 between cyanocobalamin and 7β, 8β-lactocyanocobalamin, *System suitability solution*

**Signal-to-noise ratio:** NLT 5.0 for the major peak, *Quantitative limit solution*

#### Analysis

**Sample:** *Sample solution*

[NOTE—Allow the run time be at least three times the retention time of cyanocobalamin peak.]

Identify the impurities listed in *Table 1*, and measure the peak responses.

Calculate the percentage of individual impurities in the portion of Cyanocobalamin taken:

$$\text{Result} = (r_U/r_T) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_T$  = sum of peak responses of all the peaks from the *Sample solution*

**Acceptance criteria:** See *Table 1*.

[NOTE—Disregard any peak less than 0.1%.]

**Table 1**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Cyanocobalamin	1.0	—
7β,8β-Lactocyanocobalamin	1.2	1.0
50-Carboxycyanocobalamin	1.4	0.5
34-Methylcyanocobalamin	1.5	2.0
32-Carboxycyanocobalamin	1.6	1.0
8-Epi-cyanocobalamin	2.5	1.0
Any other unidentified impurity	—	0.5
Total impurities	—	3.0

#### SPECIFIC TESTS

##### • LOSS ON DRYING <731>

**Sample:** 25 mg

**Analysis:** Dry the *Sample* in a suitable vacuum drying apparatus at 105° and at a pressure of NMT 5 mm of mercury for 2 h.

**Acceptance criteria:** NMT 12.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers, and store at controlled room temperature.

• **USP REFERENCE STANDARDS** <11>  
USP Cyanocobalamin RS

### Cyanocobalamin Injection

» Cyanocobalamin Injection is a sterile solution of Cyanocobalamin in Water for Injection, or in Water for Injection rendered isotonic by the addition of Sodium Chloride. It contains not less than 95.0 percent and not more than 115.0 percent of the labeled amount of anhydrous cyanocobalamin ( $C_{63}H_{88}CoN_{14}O_{14}P$ ).

**Packaging and storage**—Preserve in light-resistant, single-dose or multiple-dose containers, preferably of Type I glass, and store at controlled room temperature.

**USP Reference standards** <11>—

USP Cyanocobalamin RS

USP Endotoxin RS

**Identification**—The absorption spectrum, in the range of 300 nm to 550 nm, of the solution employed for measurement of absorbance in the *Assay* exhibits maxima at the same wavelengths as that of a similar solution of USP Cyanocobalamin RS, concomitantly measured, and the ratio  $A_{361}/A_{550}$  is between 3.15 and 3.40.

**Bacterial endotoxins** <85>—It contains not more than 0.4 USP Endotoxin Unit per µg of cyanocobalamin.

**pH** <791>: between 4.5 and 7.0.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—Dilute, if necessary, an accurately measured volume of Injection, equivalent to not less than 300 µg of cyanocobalamin, quantitatively and stepwise with water to a concentration of about 30 µg per mL. Dissolve an accurately weighed quantity of USP Cyanocobalamin RS in water, and dilute quantitatively and stepwise with water to obtain a Standard solution having a known concentration of about 30 µg per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 361 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in µg, of  $C_{63}H_{88}CoN_{14}O_{14}P$  in each mL of the Injection taken by the formula:

$$10(C/V)(A_U/A_S)$$

in which C is the concentration, in µg per mL, of USP Cyanocobalamin RS in the Standard solution; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the absorbances of the solution from the Injection and the Standard solution, respectively.

### Cyclandelate

$C_{17}H_{24}O_3$  276.37

3,3,5-Trimethylcyclohexanol  $\alpha$ -phenyl- $\alpha$ -hydroxyacetate.  
1,5-*cis*-3,3,5-Trimethylcyclohexyl 2-hydroxy-2-phenyl acetate [456-59-7].

» Cyclandelate contains not less than 98.0 percent of  $C_{17}H_{24}O_3$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers, and store below 40°, preferably between 15° and 30°.

**USP Reference standards** (11)—

USP Cyclandelate RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 0.5 mg per mL.

*Medium:* 95% alcohol.

The solution exhibits absorption maxima between 250 and 254 nm, between 256 and 260 nm, and between 262 and 266 nm.

**B:** *Thin-Layer Chromatographic Identification Test* (201)—

*Test solution*—Dissolve 10 mg of Cyclandelate in 1 mL of alcohol.

*Application volume:* 5  $\mu$ L.

*Developing solvent system:* a mixture of hexane, ethyl acetate, and glacial acetic acid (8:2:1).

**Loss on drying** (731)—Dry 1 g over silica gel for 24 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.002%.

**Chromatographic purity**—

*Mobile phase and Chromatographic system*—Prepare as directed in the Assay.

*Test solution*—Transfer about 100 mg of Cyclandelate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

*Standard solution*—Pipet 3.0 mL of the *Test solution* into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Test solution* and the *Standard solution* into the chromatograph, record the chromatograms, and measure the areas for all the peaks. Allow the chromatogram of the *Test solution* to run for a period of time that is about 3 times the retention time of cyclandelate. The total area of all the peaks from the *Test solution*, other than the peak obtained from cyclandelate, is not greater than the peak area of cyclandelate obtained from the *Standard solution*: not more than 3.0% of total impurities is found.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile and water (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Resolution solution*—Dissolve accurately weighed quantities of USP Cyclandelate RS and dicyclohexyl phthalate in *Mobile phase* to obtain a solution having known concentrations of about 0.2 mg per mL and 0.08 mg per mL, respectively.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Cyclandelate RS in *Mobile phase* to obtain a solution having a known concentration of about 1.0 mg per mL. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation*—Transfer about 100 mg of Cyclandelate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 10.0 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 228-nm detector and a 4.0-mm  $\times$  15-cm column that contains packing L1.

The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between cyclandelate and dicyclohexyl phthalate is not less than 7. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of  $C_{17}H_{24}O_3$  in the portion of Cyclandelate taken by the formula:

$$500C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Cyclandelate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cyclizine Hydrochloride

$C_{18}H_{22}N_2 \cdot HCl$  302.84

Piperazine, 1-(diphenylmethyl)-4-methyl-, monohydrochloride.

1-(Diphenylmethyl)-4-methylpiperazine monohydrochloride [303-25-3].

» Cyclizine Hydrochloride contains not less than 98.0 percent and not more than 100.5 percent of  $C_{18}H_{22}N_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Cyclizine Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** Dissolve 500 mg in 10 mL of a mixture of 3 volumes of alcohol and 2 volumes of water, warming if necessary. Cool the solution in an ice bath, add 1 mL of 1 N sodium hydroxide and 20 mL of water, stir, and filter: the precipitate of the base so obtained, washed with water and dried in vacuum at 60° for 2 hours, melts between 106° and 109°.

**C:** It responds to the tests for *Chloride* (191).

**pH** (791): between 4.5 and 5.5, determined potentiometrically in a 1 in 50 solution, the solvent being a mixture of 2 volumes of alcohol and 3 volumes of water.

**Loss on drying** (731)—Dry it at 120° for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Ordinary impurities** (466)—

*Test solution:* methanol.

*Standard solution:* methanol.

*Eluant:* a mixture of chloroform, methanol, and ammonium hydroxide (80:20:1).

*Visualization:* 2.

**Assay**—Transfer to a beaker about 400 mg of Cyclizine Hydrochloride, accurately weighed, and dissolve in 80 mL of glacial acetic acid. Add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 15.14 mg of  $C_{18}H_{22}N_2 \cdot HCl$ .

## Cyclizine Hydrochloride Tablets

» Cyclizine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $C_{18}H_{22}N_2 \cdot HCl$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Cyclizine Hydrochloride RS

### Identification—

**A:** Shake a quantity of finely powdered Tablets, equivalent to about 500 mg of cyclizine hydrochloride, with 25 mL of water for 5 minutes, and filter the mixture. Cool the filtrate in an ice bath, add a slight excess of 1 N sodium hydroxide, and stir well: the precipitate so obtained responds to *Identification test B* under *Cyclizine Hydrochloride*.

**B:** Tablets meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

**Dissolution, Procedure for a Pooled Sample** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_{18}H_{22}N_2 \cdot HCl$  dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{18}H_{22}N_2 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—Proceed with Tablets as directed under *Salts of Organic Nitrogenous Bases* (501), diluting the *Standard Preparation* and the *Assay Preparation*, respectively, with an equal volume of dilute sulfuric acid (1 in 100), and determining the absorbance at the wavelength of maximum absorbance at about 264 nm. Calculate the quantity, in mg, of  $C_{18}H_{22}N_2 \cdot HCl$  in the portion of Tablets taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Cyclizine Hydrochloride RS in the *Standard Preparation*.

## Cyclobenzaprine Hydrochloride

$C_{20}H_{21}N \cdot HCl$  311.85

1-Propanamine, 3-(5H-dibenzo[a,d]cyclohepten-5-ylidene)-N,N-dimethyl-, hydrochloride.

N,N-Dimethyl-5H-dibenzo[a,d]cycloheptene- $\Delta^5$ - $\gamma$ -propylamine hydrochloride [6202-23-9].

» Cyclobenzaprine Hydrochloride contains not less than 99.0 percent and not more than 101.0 percent of  $C_{20}H_{21}N \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Cyclobenzaprine Hydrochloride RS

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 15  $\mu$ g per mL.

*Medium:* methanol.

Absorptivities at 290 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** A solution (1 in 50) responds to the tests for *Chloride* (191).

**Melting range** (741): between 215° and 219°, but the range between beginning and end of melting does not exceed 2°.

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.001%.

**Chromatographic purity**—Dissolve 100 mg in methanol, and dilute with methanol to 5.0 mL to obtain the *Test solution*. Dissolve a suitable quantity of USP Cyclobenzaprine Hydrochloride RS in methanol to obtain a *Standard solution* having a known concentration of about 20 mg per mL. Dilute a portion of this solution quantitatively and stepwise with methanol to obtain a *Diluted standard solution* having a concentration of about 100  $\mu$ g per mL. Apply separate 5- $\mu$ L portions of the three solutions to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture and previously washed with methanol. Develop the chromatogram in a suitable chamber with a freshly prepared solvent system consisting of a mixture of acetone, toluene, and ammonium hydroxide (75:25:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and view under short-wavelength UV light: the  $R_f$  value of the principal spot from the *Test solution* corresponds to that of the *Standard solution*; and any other spot obtained from the *Test solution* does not exceed, in size or intensity, the principal spot obtained from the *Diluted standard solution* (0.5%).

**Assay**—Dissolve about 400 mg of Cyclobenzaprine Hydrochloride, accurately weighed, in about 80 mL of glacial acetic acid, add 15 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a platinum ring electrode and a sleeve-type calomel electrode containing 0.1 N lithium perchlorate in glacial acetic acid (see *Titrimetry* (541)). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.19 mg of  $C_{20}H_{21}N \cdot HCl$ .

## Cyclobenzaprine Hydrochloride Tablets

### DEFINITION

Cyclobenzaprine Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of cyclobenzaprine hydrochloride ( $C_{20}H_{21}N \cdot HCl$ ).

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197M)

**Sample:** Transfer an amount equivalent to 50 mg of cyclobenzaprine hydrochloride, from a quantity of finely powdered Tablets, to a small flask. Add 10 mL of methylene chloride, swirl to dissolve, and filter. Evaporate the clear filtrate to about 5 mL, transfer to a centrifuge tube, and add 1–2 mL of ether. Evaporate with the aid

of a current of air to about 1 mL, and agitate until crystallization occurs. Wash the crystals with several portions of ether, and air-dry.

**Acceptance criteria:** Meet the requirements

- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### PROCEDURE

**Mobile phase:** Acetonitrile, methanol, methanesulfonic acid, and water (28: 24: 0.2: 48). Adjust with diethylamine to a pH of 3.6.

**Standard solution:** 0.05 mg/mL of USP Cyclobenzaprine Hydrochloride RS in 0.1 N hydrochloric acid

**Sample solution:** Nominally 0.05 mg/mL of cyclobenzaprine hydrochloride from finely powdered Tablets (NLT 20) in 0.1 N hydrochloric acid prepared as follows. Transfer a suitable amount of the powder to a suitable volumetric flask. Add 75% of the flask volume of 0.1 N hydrochloric acid, and shake by mechanical means for 30 min. Dilute with 0.1 N hydrochloric acid to volume.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 290 nm

**Column:** 4.6-mm × 10-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 10 µL

### System suitability

**Sample:** *Standard solution*

### Suitability requirements

**Capacity factor:** NLT 2.0

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2

**Relative standard deviation:** NMT 2.0%

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cyclobenzaprine hydrochloride ( $C_{20}H_{21}N \cdot HCl$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of cyclobenzaprine hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### DISSOLUTION <711>

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 1:** 50 rpm

**Time:** 30 min

**Standard solution:** USP Cyclobenzaprine Hydrochloride RS in *Medium* having a concentration similar to the one expected in the *Sample solution*

**Sample solution:** Pass a portion of the solution under test through a suitable filter, and dilute with *Medium* if necessary.

### Instrumental conditions

(See *Spectrophotometry and Light-Scattering* <851>.)

**Mode:** UV

**Analytical wavelength:** 290 nm

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of cyclobenzaprine hydrochloride ( $C_{20}H_{21}N \cdot HCl$ ) dissolved.

**Tolerances:** NLT 75% (Q) of the labeled amount of cyclobenzaprine hydrochloride ( $C_{20}H_{21}N \cdot HCl$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS <905>:** Meet the requirements

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **USP REFERENCE STANDARDS <11>**

USP Cyclobenzaprine Hydrochloride RS

## Cyclopentolate Hydrochloride

$C_{17}H_{25}NO_3 \cdot HCl$  327.85

Benzeneacetic acid,  $\alpha$ -(1-hydroxycyclopentyl)-, 2-(dimethylamino)ethyl ester, hydrochloride, ( $\pm$ )-; 2-(Dimethylamino)ethyl ( $\pm$ )-1-hydroxy- $\alpha$ -phenylcyclopentaneacetate hydrochloride [5870-29-1].

» Cyclopentolate Hydrochloride contains not less than 98.0 percent and not more than 102.0 percent of  $C_{17}H_{25}NO_3 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers, and store in a cold place.

### USP Reference standards <11>

USP Cyclopentolate Hydrochloride RS

### Identification

**A:** *Infrared Absorption* <197K>.

**B:** A solution (1 in 500) responds to the tests for *Chloride* <191>.

**pH** <791>: between 4.5 and 5.5, in a solution (1 in 100).

**Loss on drying** <731>—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.05%.

### Chromatographic purity

*Buffer solution*, *Mobile phase*, and *Chromatographic system*—Prepare as directed under *Assay*.

*Test preparation*—Use the *Assay preparation*.

*Procedure*—Inject a volume (about 20 µL) of the *Test preparation* into the chromatograph, record the chromatogram obtained for a period of not less than twice the retention time of cyclopentolate, and measure the peak responses. Calculate the percentage of each peak, other than the solvent peak and the cyclopentolate peak, in the specimen of Cyclopentolate Hydrochloride taken by the same formula:

$$100r_i / r_t$$

in which  $r_i$  is the response of each peak and  $r_t$  is the sum of the responses of all of the peaks, excluding that of the solvent peak: not more than 1.0% individual impurity and not more than 2.0% total impurities are found.

### Assay

*Buffer solution*—Dissolve 660 mg of dibasic ammonium phosphate in 1000 mL of water. Adjust with phosphoric acid to a pH of  $3.0 \pm 0.1$ , and mix.

*Mobile phase*—Prepare a suitable filtered and degassed mixture of acetonitrile and *Buffer solution* (7:3). Make adjust-

ments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyclopentolate Hydrochloride RS in water, dilute quantitatively, and stepwise if necessary, with water, and mix to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer about 100 mg of Cyclopentolate Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 15-cm column that contains packing L15. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 3000 theoretical plates, the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>17</sub>H<sub>25</sub>NO<sub>3</sub> · HCl in the portion of Cyclopentolate Hydrochloride taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cyclopentolate Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the cyclopentolate peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cyclopentolate Hydrochloride Ophthalmic Solution

» Cyclopentolate Hydrochloride Ophthalmic Solution is a sterile, aqueous solution of Cyclopentolate Hydrochloride. It may contain suitable buffers and other additives. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>17</sub>H<sub>25</sub>NO<sub>3</sub> · HCl.

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**USP Reference standards** <11>—  
USP Cyclopentolate Hydrochloride RS

**Identification**—Place in a 125-mL separator a volume of Ophthalmic Solution, equivalent to about 50 mg of cyclopentolate hydrochloride, and place in a second separator about 50 mg of USP Cyclopentolate Hydrochloride RS dissolved in 5 mL of water. Treat each solution as follows. Add 1 g of potassium carbonate, and extract with two 10-mL portions of ether. Pass the ether extracts through ether-washed filter paper, collect the filtrate in a small beaker, and evaporate to dryness: the residue so obtained responds to *Identification test A* under *Cyclopentolate Hydrochloride*.

**Sterility** <71>: meets the requirements.

**pH** <791>: between 3.0 and 5.5.

**Assay**—

*Buffer solution*, *Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Cyclopentolate Hydrochloride*.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 10 mg of cyclopentolate hydrochloride, to a 100-mL volumetric flask, dilute with water to volume, and mix.

**Procedure**—Proceed as directed in the *Assay* under *Cyclopentolate Hydrochloride*. Calculate the quantity, in mg, of cyclopentolate hydrochloride (C<sub>17</sub>H<sub>25</sub>NO<sub>3</sub> · HCl) in each mL of the Ophthalmic Solution taken by the formula:

$$100(C / V)(r_U / r_S)$$

in which V is the volume, in mL, of Ophthalmic Solution taken, and the other terms are as defined therein.

## Cyclophosphamide

C<sub>7</sub>H<sub>15</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>P · H<sub>2</sub>O 279.10

C<sub>7</sub>H<sub>15</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>P 261.09

2*H*-1,3,2-Oxazaphosphorin-2-amine, *N,N*-bis(2-chloroethyl)tetrahydro-, 2-oxide, monohydrate, (±); (±)-2-[Bis(2-chloroethyl)amino]tetrahydro-2*H*-1,3,2-oxazaphosphorine 2-oxide monohydrate [6055-19-2]. Anhydrous [50-18-0].

### DEFINITION

Cyclophosphamide contains NLT 97.0% and NMT 103.0% of C<sub>7</sub>H<sub>15</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>P, calculated on the anhydrous basis.

[**CAUTION**—Great care should be taken in handling Cyclophosphamide, as it is a potent cytotoxic agent.]

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Mobile phase:** Acetonitrile and water (3:7)

**Ethylparaben solution:** Dissolve 185 mg of ethylparaben in 250 mL of alcohol in a 1000-mL volumetric flask, and dilute with water to volume.

**System suitability solution:** Transfer USP Cyclophosphamide RS, equivalent to 25 mg of anhydrous cyclophosphamide, to a 50-mL volumetric flask, add 25 mL of water, and shake to dissolve the USP Reference Standard. Add 5.0 mL of *Ethylparaben solution*, and dilute with water to volume.

**Standard solution:** 0.5 mg/mL of USP Cyclophosphamide RS in water

**Sample solution:** 0.5 mg/mL of Cyclophosphamide in water

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 195 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.5 mL/min

**Injection size:** 25 µL

**System suitability**

**Sample:** *System suitability solution*

[NOTE—The relative retention times for cyclophosphamide and ethylparaben are about 0.7 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2 between cyclophosphamide and ethylparaben

**Relative standard deviation:** NMT 2% from six replicate injections, cyclophosphamide peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_7H_{15}Cl_2N_2O_2P$  in the Cyclophosphamide taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Cyclophosphamide RS in the *Standard solution* (mg/mL). [NOTE—Concentration is calculated on the anhydrous basis.]

$C_U$  = concentration of Cyclophosphamide in the *Sample solution* (mg/mL). [NOTE—Nominal concentration is calculated on the anhydrous basis.]

**Acceptance criteria:** 97.0%–103.0% on the anhydrous basis

#### IMPURITIES

##### Inorganic Impurities

• **HEAVY METALS** (231): NMT 20 ppm

*Sample solution:* 40 mg/mL, and filter if necessary

##### Organic Impurities

##### • PROCEDURE 1: LIMIT OF PROPANOLAMINE

**Diluent:** Methylene chloride and dehydrated alcohol (17:3)

**Standard solution:** 12.5 µg/mL of USP Propanolamine RS in *Diluent*. [NOTE—Propanolamine in the *Standard solution* is 0.025% of Cyclophosphamide in the *Sample solution*.]

**Sample solution:** 50 mg/mL of Cyclophosphamide in *Diluent*

##### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.1-mm layer of chromatographic silica gel

**Application volume:** 2 µL

**Developing solvent system A:** Toluene, methylene chloride, and methanol (5:5:1). Prepare at time of use.

**Developing solvent system B:** Methanol and glacial acetic acid (9:1)

**Solution A:** Hydrochloric acid and water (7:18)

**Solution B:** 5 g/L of potassium permanganate in water

**Reagent A:** *Solution A* and *Solution B* (1:1). [NOTE—Mix in a small beaker at the time of use under a fume hood to generate chlorine gas, and immediately place the beaker with solution into closed TLC chamber (placed in a fume hood).]

**Reagent B:** 100 mg of tetramethylbenzidine in 2.5 mL of methylene chloride, and diluted with cyclohexane to 100 mL

##### Analysis

**Samples:** *Standard solution* and *Sample solution*

Develop with *Developing solvent system A* over a path of 7 cm followed by air drying for 15 min. Develop again in *Developing solvent system B* over a path of 2 cm followed by air drying for NLT 10 min. [NOTE—Transfer *Developing solvent system B* to the chamber 15 min before development.] Dry the plate at 45° under a vacuum for 50 min. Place the plate in a closed chromatography tank (placed in a fume hood) containing *Reagent A*, and leave the plate in the tank for 10 min. Remove the plate and place it in a fume hood for 10 min to remove the excess chlorine. Stain the plate by dipping it into *Reagent B*. Remove it from *Reagent B* and wait for 15 min, evaluate it with a suitable densitometer, equipped with a filter having its maximum transmittance at 375 nm, and locate and scan the

spot produced by propanolamine from the *Standard solution* and any spot from the *Sample solution* having the same  $R_f$  as that produced by propanolamine from the *Standard solution*.

##### Acceptance criteria

**Propanolamine:** The spot of propanolamine from the *Sample solution* is not more intense than the spot of propanolamine from the *Standard solution* (0.025%).

##### • PROCEDURE 2: LIMIT OF DEGRADATION PRODUCTS

**Diluent:** Methanol and water (1:1)

**Standard solution A:** 12 µg/mL of USP Cyclophosphamide Related Compound A RS in *Diluent*

**Standard solution B:** 12 µg/mL of USP Cyclophosphamide Related Compound B RS in *Diluent*

**Standard solution C:** 12 µg/mL of USP Cyclophosphamide Related Compound C RS in *Diluent*

**Standard solution D:** 15 µg/mL of USP Cyclophosphamide Related Compound D RS in *Diluent*.

[NOTE—Cyclophosphamide related compound D is free base ( $M_r = 260.66$ ) and USP Cyclophosphamide Related Compound D RS is available as dihydrochloride salt ( $M_r = 333.58$ ).]

**Standard solution E:** 12 µg/mL of USP Cyclophosphamide RS in *Diluent*

**Sample solution:** 20 mg/mL of Cyclophosphamide in *Diluent*

##### Chromatographic system

(See *Chromatography* (621), *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture containing a fluorescent indicator

**Application volume:** 20 µL

**Developing solvent system:** Methylene chloride, glacial acetic acid, methanol, and water (50:25:15:12)

**Reagent A:** 3.16 g/L solution of potassium permanganate in water and 10% hydrochloric acid (1:1).

[NOTE— Mix in a small beaker at the time of use under a fume hood to generate chlorine gas, and immediately place the beaker with solution into closed TLC chamber (placed in a fume hood).]

**Reagent B:** Dissolve 250 mg of tetramethylbenzidine in 50 mL of dehydrated alcohol, and dilute with cyclohexane to 200 mL.

##### Analysis

**Samples:** *Standard solution A*, *Standard solution B*, *Standard solution C*, *Standard solution D*, *Standard solution E*, and *Sample solution*

[NOTE— Apply *Standard solution E* after the plate development in the *Developing solvent system*. Proceed as directed in the *Analysis* below.]

Develop with *Developing solvent system* over a path of 10 cm followed by drying at room temperature for 15 min in a fume hood. Develop again in the fresh portion of the *Developing solvent system* over a path of 10 cm followed by drying at room temperature for 15 min in a fume hood. Apply *Standard solution E* at the starting point of the plate. Dry the plate in an oven at 50° under a vacuum for 20 min or using a TLC heating plate at 50° for 20 min in a fume hood. Allow the plate to stand at room temperature for 5 min. Place the plate in a closed chromatography tank (placed in a fume hood) containing *Reagent A*, and leave the plate in the tank for at least 15 min. Remove the plate and place it in a fume hood for 15 min to remove the excess chlorine. Stain the plate by dipping it into *Reagent B* or spraying it with *Reagent B*. Examine the plate by visual evaluation.

##### Acceptance criteria

The spot of cyclophosphamide related compound A from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound A from *Standard solution A* (0.06%).

The spot of cyclophosphamide related compound B from the *Sample solution* is not more intense than the

spot of cyclophosphamide related compound B from *Standard solution B* (0.06%).

The spot of cyclophosphamide related compound C from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound C from *Standard solution C* (0.06%).

The spot of cyclophosphamide related compound D from the *Sample solution* is not more intense than the spot of cyclophosphamide related compound D from *Standard solution D* (0.06%).

The spot of any individual unspecified impurity in the *Sample solution* is not more intense than the spot of cyclophosphamide from *Standard solution E* (0.06%).

**Individual impurities:** See *Impurity Table 1*.

**Impurity Table 1**

Name	Retardation Factor	Acceptance Criteria, NMT (%)
Cyclophosphamide related compound D <sup>a</sup>	0.15	0.06
Cyclophosphamide related compound C <sup>b</sup>	0.20	0.06
Cyclophosphamide related compound B <sup>c</sup>	0.43	0.06
Cyclophosphamide related compound A <sup>d</sup>	0.90	0.06
Any unspecified impurity	—	0.06

<sup>a</sup> 3-[2-(2-Chloroethylamino)ethylamino]propyl dihydrogen phosphate.

<sup>b</sup> 3-Aminopropyl dihydrogen phosphate.

<sup>c</sup> 3-(2-Chloroethyl)-2-oxo-2-hydroxy-1,3,6,2-oxadiazaphosphonane.

<sup>d</sup> Bis(2-chloroethyl)amine hydrochloride.

## SPECIFIC TESTS

### • LIMIT OF CHLORIDE

**Sample solution:** Dissolve 2.0 g of Cyclophosphamide in 30 mL of water, and add 80 mL of isopropyl alcohol and 5 mL of 10% nitric acid.

**Analysis:** Titrate potentiometrically with 0.01 N silver nitrate VS. Perform a blank determination, and make any necessary correction (see *Titrimetry* <541>). Each 1.0 mL of 0.01 N silver nitrate equals 0.355 mg of chloride ion. Calculate the percentage of chloride in the portion of Cyclophosphamide taken:

$$\text{Result} = [(V - B) \times N \times F \times 100] / [TN \times W \times (100 - A) / 100]$$

V = sample titrant volume (mL)

B = blank titrant volume (mL)

N = titrant normality

F = equivalence factor, 0.355 mg of chloride ion/mL of TN

TN = theoretical normality, 0.01 N

W = sample weight (mg)

A = assay correction for water

**Acceptance criteria:** NMT 0.033%

### • LIMIT OF PHOSPHATE

**Diluent:** 0.2 g/mL of hydrochloric acid in water

**Solution A:** Heat 20 g of tin with 85 mL of hydrochloric acid until no more hydrogen is released. Allow to cool. Transfer 1.0 mL of this solution into a 10-mL volumetric flask, and dilute with *Diluent* to volume.

**Standard stock solution:** 0.72 g/L of monobasic potassium phosphate. Transfer 1.0 mL of this solution into a 100-mL volumetric flask, and dilute with water to volume. Prepare immediately before use.

**Standard solution:** *Standard stock solution* and water (1:49). Prepare immediately before use. [NOTE—This solution contains 100 µg/L of PO<sub>4</sub>.]

**Sample solution:** Dissolve 100 mg of Cyclophosphamide in water, and dilute to 100 mL.

**Analysis:** To the *Sample solution* add 4 mL of sulfomolybdic acid TS. Shake and add 0.1 mL of *Solution A*. Prepare a standard in the same manner using the *Standard solution*. After 10 min, compare the colors using 20 mL of each solution in color comparison tubes in diffused daylight, viewing vertically against a white background.

**Acceptance criteria:** Any color from the *Sample solution* is not more intense than that from the *Standard solution* (NMT 0.01%).

• **BACTERIAL ENDOTOXINS TEST** <85>: Where the label states that Cyclophosphamide is sterile, it contains NMT 0.0625 USP Endotoxin Unit/mg of cyclophosphamide.

• **STERILITY TESTS** <71>: Where the label states that Cyclophosphamide is sterile, it meets the requirements.

• **PH** <791>: 3.9–7.1, in a solution (1 in 100), determined 30 min after its preparation

• **WATER DETERMINATION, Method I** <921>: 5.7%–6.8%

## ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers at a temperature between 2° and 30°.

• **LABELING:** Where the label states that Cyclophosphamide is sterile, the tests for *Bacterial Endotoxins Test* <85> and *Sterility Tests* <71> should be performed.

## Cyclophosphamide for Injection

» Cyclophosphamide for Injection is a sterile mixture of Cyclophosphamide with or without a suitable diluent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous cyclophosphamide (C<sub>7</sub>H<sub>15</sub>Cl<sub>2</sub>N<sub>2</sub>O<sub>2</sub>P).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>. Storage at a temperature not exceeding 25° is recommended. It will withstand brief exposure to temperatures up to 30°, but is to be protected from temperatures above 30°.

### USP Reference standards <11>—

USP Cyclophosphamide RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

### Identification—

**A:** It responds to the *Thin-layer Chromatographic Identification Test* <201>, a solution of it in chloroform, equivalent to 20 mg of cyclophosphamide per mL, filtered if necessary,

being used as the test solution. Apply 5  $\mu$ L of the test solution and the Standard solution, use a solvent system consisting of a mixture of chloroform, methanol, and ammonium hydroxide (75:20:5), and visualize the spots by placing the plate in an iodine chamber.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.20 USP Endotoxin Unit per mg of cyclophosphamide.

**pH** (791): between 3.0 and 9.0, but the range does not exceed 3 pH units, in a solution containing the equivalent of 20 mg of anhydrous cyclophosphamide per mL, determined 30 minutes after its preparation.

**Other requirements**—It meets the requirements for *Sterility Tests* (71), *Uniformity of Dosage Units* (905), and *Labeling under Injections* (1).

#### Assay—

**Mobile phase**—Prepare a suitable, degassed solution of water and acetonitrile (70:30).

**Internal standard solution**—Dissolve 185 mg of ethylparaben in 250 mL of alcohol in a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparation**—Transfer an accurately weighed quantity of USP Cyclophosphamide RS, equivalent to about 25 mg of anhydrous cyclophosphamide, to a 50-mL volumetric flask, add about 25 mL of water, and shake to dissolve the USP Reference Standard. Add 5.0 mL of *Internal standard solution*, dilute with water to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.5 mg of anhydrous cyclophosphamide per mL.

**Assay preparation**—Accurately weigh a portion of Cyclophosphamide for Injection, equivalent to about 200 mg of anhydrous cyclophosphamide, to a 200-mL volumetric flask, add about 50 mL of water, and shake for about 5 minutes, dilute with water to volume, and mix. Pipet 25 mL of this solution and 5 mL of *Internal standard solution* into a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatography is equipped with a 195-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph six replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2%, and the resolution factor between cyclophosphamide and ethylparaben is not less than 2.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for cyclophosphamide and 1.0 for ethylparaben. Calculate the quantity, in mg, of  $C_7H_{15}Cl_2N_2O_2P$  in the portion of Cyclophosphamide for Injection taken by the formula:

$$400C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of anhydrous cyclophosphamide in the *Standard preparation*, as determined from the concentration of USP Cyclophosphamide RS corrected for moisture by a titrimetric water determination; and  $R_U$  and  $R_S$  are the ratios of the peak responses of cyclophosphamide to those of the internal standard in the *Assay preparation* and the *Standard preparation*, respectively.

## Cyclophosphamide Tablets

» Cyclophosphamide Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of anhydrous cyclophosphamide ( $C_7H_{15}Cl_2N_2O_2P$ ).

**Packaging and storage**—Preserve in tight containers. Storage at a temperature not exceeding 25° is recommended. Tablets will withstand brief exposure to temperatures up to 30°, but are to be protected from temperatures above 30°.

**USP Reference standards** (11)—

USP Cyclophosphamide RS

#### Identification—

**A:** Extract a portion of finely powdered Tablets, equivalent to about 50 mg of cyclophosphamide, with 25 mL of chloroform, filter about 2 mL of the chloroform solution, mix the filtrate with 500 mg of potassium bromide, evaporate the chloroform, carefully removing the last trace of solvent in a small vacuum flask, and use the residue to prepare a potassium bromide dispersion: the IR absorption spectrum of the potassium bromide dispersion so obtained exhibits maxima, between 6.5 and 14  $\mu$ m, only at the same wavelengths as that of a similar preparation of USP Cyclophosphamide RS.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

**Medium:** water; 900 mL, deaerated.

**Apparatus:** 1:100 rpm.

**Time:** 45 minutes.

Determine the amount of  $C_7H_{15}Cl_2N_2O_2P$  dissolved by employing the following method.

**Mobile phase**—Prepare a suitable filtered and degassed mixture of water and acetonitrile (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Cyclophosphamide RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration corresponding to that of the solution under test.

**Test solution**—Use portions of the solution under test passed through a 0.8- $\mu$ m filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 195-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peak. Calculate the amount of cyclophosphamide ( $C_7H_{15}Cl_2N_2O_2P$ ) dissolved by the formula:

$$900C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cyclophosphamide RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses for cyclophosphamide obtained from the *Test solution* and *Standard solution*, respectively.

**Tolerances**—Not less than 75% (Q) of the labeled amount of cyclophosphamide ( $C_7H_{15}Cl_2N_2O_2P$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**PROCEDURE FOR CONTENT UNIFORMITY**—

**Perchloric acid solution**—Dissolve 23.5 mL of perchloric acid in water, and dilute with water to 1 L.

**4-(p-Nitrobenzyl)pyridine solution**—Dissolve 1.5 g of 4-(p-nitrobenzyl)pyridine in 200 mL of ethylene glycol.

**Sodium hydroxide solution**—Dissolve 20 g of sodium hydroxide in 1000 mL of diluted alcohol.

**Procedure**—Place 1 Tablet in a volumetric flask of suitable size so that the final concentration is about 500 µg per mL. Fill the flask about two-thirds full of water, shake until the Tablet is completely disintegrated, dilute with water to volume, and filter, discarding the first 10 mL of the filtrate. Place in separate 27-mm × 170-mm test tubes 2.0 mL of the filtrate, 2.0 mL of water to provide a blank, and 2.0 mL of the Standard solution, prepared by dissolving an accurately weighed quantity of USP Cyclophosphamide RS in water and diluting quantitatively and stepwise with water to obtain a solution having a known concentration of about 500 µg per mL. Treat each tube as follows. Add 0.7 mL of *Perchloric acid solution*, mix, and heat at 95° for 10 minutes. Cool, add 1.0 mL of sodium acetate TS, mix, add 1.6 mL of *4-(p-Nitrobenzyl)pyridine solution*, mix, and heat at 95° for 10 minutes. Cool, add 8.0 mL of *Sodium hydroxide solution*, and mix. Within 4 minutes, determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at 560 nm, with a suitable spectrophotometer, against the blank. Calculate the quantity, in mg, of  $C_7H_{15}Cl_2N_2O_2P$  in the Tablet taken by the formula:

$$(T/500)(A_U / A_S)$$

in which *T* is the labeled quantity, in mg, of anhydrous cyclophosphamide in the Tablet; *C* is the concentration, in µg per mL, of USP Cyclophosphamide RS, corrected for moisture by a titrimetric water determination, in the Standard solution; and *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances of the solution from the Tablet and the Standard solution, respectively.

**Assay**—

**Mobile phase**—Prepare a suitable, degassed solution of water and acetonitrile (70:30).

**Internal standard solution**—Dissolve 185 mg of ethylparaben in 250 mL of alcohol in a 1000-mL volumetric flask, dilute with water to volume, and mix.

**Standard preparation**—Transfer an accurately weighed quantity of USP Cyclophosphamide RS, equivalent to about 25 mg of anhydrous cyclophosphamide, to a 50-mL volumetric flask, add about 25 mL of water, and shake to dissolve the USP Reference Standard. Add 5.0 mL of *Internal standard solution*, dilute with water to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.5 mg of anhydrous cyclophosphamide per mL.

**Assay preparation**—Transfer not fewer than 10 Tablets to a volumetric flask of suitable size so that the final concentration is about 1 mg of anhydrous cyclophosphamide per mL. Fill about half full with water, shake for 30 minutes, dilute with water to volume, and mix. Filter through fast, fluted filter paper, discarding the first 40 to 50 mL of the filtrate. Pipet 25 mL of the filtrate and 5 mL of *Internal standard solution* into a 50-mL volumetric flask, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatography is equipped with a 195-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph six replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the rela-

tive standard deviation is not more than 2%, and the resolution factor between cyclophosphamide and ethylparaben is not less than 2.

**Procedure**—Separately inject equal volumes (about 25 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.7 for cyclophosphamide and 1.0 for ethylparaben. Calculate the quantity, in mg, of  $C_7H_{15}Cl_2N_2O_2P$  per Tablet taken by the formula:

$$(2CV/N)(R_U / R_S)$$

in which *C* is the concentration, in mg per mL, of anhydrous cyclophosphamide in the *Standard preparation*, as determined from the concentration of USP Cyclophosphamide RS corrected for moisture by a titrimetric water determination; *V* is the volume, in mL, of the volumetric flask to which the *N* Tablets were transferred; *N* is the number of Tablets taken; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak responses of cyclophosphamide to those of the internal standard in the *Assay preparation* and the *Standard preparation*, respectively.

## Cyclopropane

$C_3H_6$  42.08  
Cyclopropane.  
Cyclopropane [75-19-4].

» Cyclopropane contains not less than 99.0 percent, by volume, of  $C_3H_6$ .

**Caution**—Cyclopropane is highly flammable. Do not use where it may be ignited.

**Packaging and storage**—Preserve in cylinders. [NOTE—Maintain cylinders of Cyclopropane at 25 ± 2° for not less than 6 hours prior to withdrawing specimens for the tests and assay, and correct the results to 25° and 760 mm of mercury.]

**Labeling**—The label bears a warning that cyclopropane is highly flammable and is not to be used where it may be ignited.

**Acidity or alkalinity**—Add 0.3 mL of methyl red TS and 0.3 mL of bromothymol blue TS to 400 mL of boiling water, and boil the solution for 5 minutes. Pour 100 mL of the boiling solution into each of three color-comparison tubes marked *A*, *B*, and *C*, respectively. To tube *B* add 0.20 mL of 0.012 N hydrochloric acid, and to tube *C* add 0.40 mL of 0.012 N hydrochloric acid. Insert the stopper in each of the tubes, and cool them to room temperature. Pass 2000 mL of Cyclopropane through the solution in tube *B* at a rate requiring about 30 minutes for the passage of the gas: the color of the solution in tube *B* is no deeper orange-red than that in tube *C* and no deeper yellow-green than that in tube *A*.

NOTE—The various detector tubes called for in the respective tests are listed under *Reagents* in the section *Reagents, Indicators, and Solutions*.

**Carbon dioxide**—Place the container so that when its valve is opened, the gaseous phase can be sampled. Connect one end of a carbon dioxide detector tube to the container valve, and the other end to a gas flow meter. Pass 1000 mL of the Cyclopropane through the tube at a suitable rate: the indicator change corresponds to not more than 0.03%.

**Halogens**—Provide a 500-mL flask with a tightly fitting two-hole stopper. Through one opening pass a delivery tube bent at right angles and extending just beyond the lower surface of the stopper. Through the other opening insert a capillary tube bent at right angles and having a bore of  $1 \pm 0.2$  mm, in the same manner. Place in a 50-mL cylinder, having an internal diameter of  $2 \pm 0.25$  cm, 40 mL of a solution containing 850 mg of sodium carbonate in 1000 mL of water. Provide the cylinder with a two-hole stopper, and through one opening pass a right-angle delivery tube, having a bore of  $3 \pm 0.5$  mm, to within 2 mm of the bottom of the cylinder. The end of the delivery tube that extends out of the cylinder is provided with an enlargement  $8 \pm 0.5$  cm long having an internal diameter of  $2 \pm 0.25$  cm. Through the other opening in the stopper pass another right-angle delivery tube, having it extend just below the surface of the stopper. Collect 500 mL of Cyclopropane in the flask. By means of hydrostatic pressure, applied through the delivery tube, force the gas through the capillary tube, the water used being previously saturated with Cyclopropane. Ignite the gas, place the enlarged end of the delivery tube, connected with the cylinder, around the flame, extending the flame one-third of the way into the enlargement. Apply suction to the shorter delivery tube connected with the cylinder, thus drawing the spent gases through the sodium carbonate solution, the period of ignition of the 500 mL of Cyclopropane requiring approximately 30 minutes. Make any necessary correction for the amount of halogen in the volume of air used for the ignition of the gas. Transfer the sodium carbonate solution to a 500-mL volumetric flask, and rinse the cylinder thoroughly, collecting the rinsings in the flask. Dilute the solution with water to volume, and mix. To a 50-mL aliquot add sufficient nitric acid to make it acid to litmus paper, and then add 1 mL of acid in excess. Prepare a blank containing 0.50 mL of 0.0012 N hydrochloric acid and 4 mL of the sodium carbonate solution in 46 mL of water, acidify to litmus with nitric acid, then add 1 mL of acid in excess and 1 mL of silver nitrate TS to each solution: after 5 minutes any opalescence in the solution representing the Cyclopropane does not exceed that in the blank (0.02% as chloride).

**Propylene, allene, and other unsaturated hydrocarbons**—Place the container so that when its valve is opened, the gaseous phase can be sampled. Connect one end of an olefin detector tube to the container valve, and the other end to a gas flow meter. Pass the Cyclopropane through the detector tube at a suitable rate: the color of the indicating layer of the tube contents matches the color standard after the passage of not less than 400 mL of Cyclopropane (0.9% as propylene).

**Assay**—Place the container so that when its valve is opened, the gaseous phase can be sampled. Withdraw 100 mL of Cyclopropane, accurately measured in a gas buret previously filled with mercury and equipped with a leveling bulb at the lower end. Connect one arm of the buret stopcock to a pipet that previously has been filled with sulfuric acid. By appropriate manipulation of the stopcock and the leveling bulb, transfer the gas between the pipet and the buret, bringing about sufficient contact of the gas with the acid to reduce the volume of unabsorbed gas to a minimum as measured in the buret. Not more than 1.0 mL of gas remains.

(+)-4-Amino-3-isoxazolidinone [68-41-7].

» Cycloserine has a potency of not less than 900  $\mu\text{g}$  of  $\text{C}_3\text{H}_6\text{N}_2\text{O}_2$  per mg.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cycloserine RS

**Identification**—Dissolve about 1 mg in 10 mL of 0.1 N sodium hydroxide. To 1 mL of the resulting solution add 3 mL of 1 N acetic acid and 1 mL of a mixture, prepared 1 hour before use, of equal parts of sodium nitroprusside solution (1 in 25) and 4 N sodium hydroxide: a blue color gradually develops.

**Condensation products**—Its absorptivity (see *Spectrophotometry and Light-Scattering* (851)) at 285 nm, determined in a 0.1 N sodium hydroxide solution containing 0.40 mg per mL is not more than 0.80.

**Specific rotation** (781S): between  $108^\circ$  and  $114^\circ$ .

*Test solution*: 50 mg per mL, in 2 N sodium hydroxide.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 5.5 and 6.5, in a solution (1 in 10).

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at  $60^\circ$  for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%, the charred residue being moistened with 2 mL of nitric acid and 5 drops of sulfuric acid.

**Assay**—

*pH 6.8 Phosphate buffer*—Prepare as directed in *Buffer Solutions* under *Solutions* in the section *Reagents, Indicators, and Solutions*.

*Mobile phase*—Dissolve 0.5 g of sodium 1-decanesulfonate in 800 mL of water, add 50 mL of acetonitrile and 5 mL of glacial acetic acid, and mix. Adjust with 1 N sodium hydroxide to a pH of 4.4. Filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Quantitatively dissolve an accurately weighed quantity of USP Cycloserine RS in *pH 6.8 Phosphate buffer* to obtain a solution having a known concentration of about 0.4 mg per mL.

*Assay preparation*—Transfer about 20 mg of Cycloserine, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *pH 6.8 Phosphate buffer* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 219-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5- $\mu\text{m}$  packing L1. The flow rate is about 1 mL per minute. The column temperature is maintained at about  $30^\circ$ . Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.8; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for cycloserine. Calculate the quantity, in  $\mu\text{g}$ , of  $\text{C}_3\text{H}_6\text{N}_2\text{O}_2$  in each mg of Cycloserine taken by the formula:

$$50,000(C/W)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cycloserine RS in the *Standard preparation*; W is the quantity, in mg, of Cycloserine taken to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses for cycloserine obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cycloserine

$\text{C}_3\text{H}_6\text{N}_2\text{O}_2$  102.09  
3-Isloxazolidinone, 4-amino-, (R)-.

## Cycloserine Capsules

» Cycloserine Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of cycloserine ( $C_3H_6N_2O_2$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cycloserine RS

**Identification**—Shake a quantity of the contents of Capsules, equivalent to about 10 mg of cycloserine, with 100 mL of 0.1 N sodium hydroxide, and filter: 1 mL of the filtrate so obtained responds to the *Identification* test under *Cycloserine*.

**Dissolution** (711)—

*Medium:* pH 6.8 Phosphate buffer (see *Buffer Solutions* under *Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 30 minutes.

Determine the amount of  $C_3H_6N_2O_2$  dissolved by employing the following method.

pH 6.8 Phosphate buffer, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the *Assay*.

*Standard solution*—Quantitatively dissolve an accurately weighed quantity of USP Cycloserine RS in pH 6.8 Phosphate buffer to obtain a solution having a known concentration of about 0.25 mg per mL.

*Test solution*—Use a filtered portion of the solution under test.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses for cycloserine. Calculate the quantity, in mg, of cycloserine ( $C_3H_6N_2O_2$ ) dissolved by the formula:

$$900C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cycloserine RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the peak responses for cycloserine obtained from the *Test solution* and the *Standard solution*, respectively.

*Tolerances*—Not less than 80% (Q) of the labeled amount of  $C_3H_6N_2O_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 100 mg of the contents of Capsules in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 1.0% of its weight.

**Assay**—

pH 6.8 Phosphate buffer, *Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Cycloserine*.

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of cycloserine, to a 250-mL volumetric flask, dilute with pH 6.8 Phosphate buffer to volume, mix, and filter.

*Procedure*—Proceed as directed in the *Assay* under *Cycloserine*. Calculate the quantity, in mg, of cycloserine ( $C_3H_6N_2O_2$ ) in the portion of Capsules taken by the formula:

$$250C(r_U / r_S)$$

in which the terms are as defined therein.

## Cyclosporine

$C_{62}H_{111}N_{11}O_{12}$  1202.61

Cyclo[[*(E)*-(2*S*,3*R*,4*R*)-3-hydroxy-4-methyl-2-(methylamino)-6-octenoyl]-L-2-aminobutyryl-N-methylglycyl-N-methyl-L-leucyl-L-valyl-N-methyl-L-leucyl-L-alanyl-D-alanyl-N-methyl-L-leucyl-N-methyl-L-leucyl-N-methyl-L-valyl].

[*R*-[*R*\*,*R*\*-*(E)*]-Cyclic(L-alanyl-D-alanyl-N-methyl-L-leucyl-N-methyl-L-leucyl-N-methyl-L-valyl-3-hydroxy-N,4-dimethyl-L-2-amino-6-octenoyl-L- $\alpha$ -aminobutyryl-N-methylglycyl-N-methyl-L-leucyl-L-valyl-N-methyl-L-leucyl)] [59865-13-3].

» Cyclosporine contains not less than 98.5 percent and not more than 101.5 percent of cyclosporine A ( $C_{62}H_{111}N_{11}O_{12}$ ), calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Cyclosporine RS

USP Cyclosporine Resolution Mixture RS

This material is a 100:1 mixture of cyclosporine and cyclosporine U.

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cyclosporine, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

**Heavy metals**, *Method II* (231): 0.002%.

**Related compounds**—Using the chromatograms obtained from *Standard preparation 2* and the *Assay preparation* in the *Assay*, calculate the percentage of each impurity by the formula:

$$2000(C / W)(r_i / r_{S2})$$

in which C is the concentration, in mg per mL, of USP Cyclosporine RS in *Standard preparation 2*; W is the weight, in mg, of Cyclosporine taken to prepare the *Assay preparation*;  $r_i$  is the response of an individual impurity observed in the chromatogram of the *Assay preparation*; and  $r_{S2}$  is the response of the main cyclosporine peak in the chromatogram obtained from *Standard preparation 2*: not more than 0.7% of any individual impurity is found, and the sum of all such impurities is not more than 1.5%, any impurities corresponding to less than 0.05% being disregarded.

**Assay**—

*Mobile phase*—Prepare a mixture of water, acetonitrile, *tert*-butyl methyl ether, and phosphoric acid (520:430:50:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of acetonitrile and water (1:1).

*Standard preparation 1*—Dissolve an accurately weighed quantity of USP Cyclosporine RS in *Diluent* to obtain a solution having a known concentration of about 1.25 mg per mL.

**Standard preparation 2**—Transfer 2.0 mL of *Standard preparation 1* to a 250-mL volumetric flask, dilute with *Diluent* to volume, and mix. This solution contains about 0.01 mg of USP Cyclosporine RS per mL.

**Assay preparation**—Dissolve about 25 mg of Cyclosporine, accurately weighed, in *Diluent*, dilute with *Diluent* to 20.0 mL, and mix.

**Resolution solution**—Prepare a solution of USP Cyclosporine Resolution Mixture RS in *Diluent* having a concentration of about 1.25 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector, a 0.25-mm × 1-m stainless steel tube connected to a 4-mm × 25-cm column that contains 3- to 5-μm packing L1. The tube and column are maintained at 80°. The flow rate is about 1.2 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the cyclosporine U peak and the main cyclosporine peak are resolved from each other. Chromatograph *Standard preparation 1*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%. Chromatograph *Standard preparation 2*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 10%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20 μL) of *Standard preparation 1*, *Standard preparation 2*, and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of cyclosporine A (C<sub>62</sub>H<sub>111</sub>N<sub>11</sub>O<sub>12</sub>) in the Cyclosporine taken by the formula:

$$(CP/10U)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cyclosporine RS in *Standard preparation 1*; P is the specified purity, in μg per mg, of USP Cyclosporine RS; U is the concentration, in mg per mL, of specimen in the *Assay preparation*; and  $r_U$  and  $r_S$  are the main cyclosporine peak responses obtained from the *Assay preparation* and *Standard preparation 1*, respectively.

## Cyclosporine Capsules

» Cyclosporine Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cyclosporine (C<sub>62</sub>H<sub>111</sub>N<sub>11</sub>O<sub>12</sub>).

**Packaging and storage**—Preserve in tight containers, and store at controlled room temperature.

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** (711)—

WHERE CAPSULES CONTAIN LIQUID—

**Medium:** water; 500 mL.

**Apparatus 2:** 50 rpm.

**Time:** 15 minutes.

**Procedure**—Place 1 Capsule in each vessel, and allow the Capsule to sink to the bottom of the vessel before starting rotation of the blade. Observe the Capsules, and record the time taken for each Capsule shell to rupture.

**Tolerances**—The requirements are met if all of the Capsules tested rupture in not more than 15 minutes. If 1 or 2 of the Capsules rupture in more than 15 but not more than

30 minutes, repeat the test on 12 additional Capsules. Not more than 2 of the total of 18 Capsules tested rupture in more than 15 but not more than 30 minutes.

WHERE CAPSULES CONTAIN POWDER—

**Medium:** 0.1 N hydrochloric acid containing 0.5% of sodium lauryl sulfate; 1000 mL.

**Apparatus 1:** 150 rpm.

**Time:** 90 minutes.

Determine the amount of C<sub>62</sub>H<sub>111</sub>N<sub>11</sub>O<sub>12</sub> dissolved by employing the following method.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, water, methanol, and phosphoric acid (900:450:50:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Quantitatively dissolve an accurately weighed quantity of USP Cyclosporine RS in *Dissolution Medium* to obtain a solution having a known concentration of about 0.001 L mg per mL, L being the labeled quantity, in mg, of cyclosporine in each Capsule. Transfer 25.0 mL of this solution to a 50-mL volumetric flask, dilute with acetonitrile to volume, and mix. This solution contains about 0.0005 L mg of USP Cyclosporine RS per mL.

**Test solution**—Filter a portion of the solution under test. Transfer 5.0 mL of the filtrate to a 10-mL volumetric flask, dilute with acetonitrile to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm × 25-cm column that contains packing L1 and is maintained at a constant temperature of about 80°. The flow rate is about 2 mL per minute. Chromatograph the *Standard solution*, and record the peak areas as directed for *Procedure*: the column efficiency is not less than 700 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 μL) of the solution estimated to contain 0.1 mg of cyclosporine per mL, or 40 μL of the solution estimated to contain 0.025 mg of cyclosporine per mL of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of C<sub>62</sub>H<sub>111</sub>N<sub>11</sub>O<sub>12</sub> dissolved by the formula:

$$2000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cyclosporine RS in the *Standard solution*; and  $r_U$  and  $r_S$  are the cyclosporine peak areas obtained from the *Test solution* and the *Standard solution*, respectively.

**Tolerances**—Not less than 80% (Q) of the labeled amount of C<sub>62</sub>H<sub>111</sub>N<sub>11</sub>O<sub>12</sub> is dissolved in 90 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921)—For Capsules that contain powder, not more than 3.5% is found, using finely ground Capsule contents.

**Assay**—

WHERE CAPSULES CONTAIN LIQUID—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay* under *Cyclosporine Injection*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyclosporine RS in dehydrated alcohol to obtain a solution having a known concentration of about 1 mg per mL. Use this solution promptly after preparation.

**Assay preparation**—Using a sharp blade, carefully cut open not fewer than 20 Capsules, and with the aid of dehydrated alcohol transfer the contents of the Capsules to a suitable volumetric flask. Wash the blade with dehydrated alcohol, and transfer the washings to the volumetric flask. Dilute the contents of the volumetric flask with dehydrated alcohol to volume, and mix. Quantitatively dilute an accu-

rately measured volume of this solution with dehydrated alcohol to obtain a solution having a concentration of about 1 mg of cyclosporine per mL.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of cyclosporine ( $C_{62}H_{111}N_{11}O_{12}$ ) in each Capsule taken by the formula:

$$(L/D)(CP/1000)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of cyclosporine in each Capsule taken; *D* is the concentration, in mg per mL, of the *Assay preparation*, based on the labeled quantity of cyclosporine in the Capsules taken and the extent of dilution; *C* is the concentration, in mg per mL, of USP Cyclosporine RS in the *Standard preparation*; *P* is the purity, in  $\mu$ g per mg, of USP Cyclosporine RS; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

WHERE CAPSULES CONTAIN POWDER—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, water, methanol, and phosphoric acid (605:400:50:0.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluting solvent**—Prepare a mixture of acetonitrile, tetrahydrofuran, and dehydrated alcohol (9:5:4).

**Standard preparation**—Transfer about 25 mg of USP Cyclosporine RS, accurately weighed, to a 25-mL volumetric flask. Add 2.5 mL of water, and sonicate for 10 minutes. Add about 10 mL of *Diluting solvent*, sonicate for 5 minutes, dilute with *Diluting solvent* to volume, and mix.

**Assay stock preparation**—Transfer the contents of 20 Capsules to a volumetric flask of such capacity, *V*, in mL, to make a final concentration of 10 mg of cyclosporine per mL. Add 0.1*V* mL of water to the flask, and sonicate for 10 minutes. Add 0.4*V* mL of *Diluting solvent* to the flask, and sonicate for 5 minutes. Dilute with *Diluting solvent* to volume, and mix.

**Assay preparation**—Transfer 5.0 mL of *Assay stock preparation* to a 50-mL volumetric flask, add 5 mL of water, dilute with *Diluting solvent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L13 and is maintained at a constant temperature of about 70°. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the column efficiency is not less than 700 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of cyclosporine ( $C_{62}H_{111}N_{11}O_{12}$ ) in each Capsule taken by the formula:

$$10CV(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Cyclosporine RS in the *Standard preparation*; *V* is the volume, in mL, of the volumetric flask used to prepare the *Assay stock preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the cyclosporine peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cyclosporine Injection

» Cyclosporine Injection is a sterile solution of Cyclosporine in a suitable vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cyclosporine ( $C_{62}H_{111}N_{11}O_{12}$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers.

**Labeling**—Label it to indicate that it is to be diluted with a suitable parenteral vehicle prior to intravenous infusion.

**USP Reference standards** (11)—

USP Cyclosporine RS

USP Endotoxin RS

**Identification**—

**A:** Prepare a solution of it in methanol containing about 0.5 mg of cyclosporine per mL (test solution). Prepare a Standard solution containing 0.5 mg per mL of USP Cyclosporine RS in methanol. Separately apply 10- $\mu$ L portions of the test solution and the Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry in a current of air, place the plate in a suitable chromatographic chamber, and develop the chromatogram, using ethyl ether as the developing solvent, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and allow it to dry. Place the plate in a second chromatographic chamber, and develop the chromatogram in a solvent system consisting of a mixture of ethyl acetate, methyl ethyl ketone, water, and formic acid (60:40:2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, and allow it to dry. Spray the plate with a freshly prepared mixture of 5 mL of *Solution A* (340 mg of bismuth subnitrate dissolved in 20 mL of 20% acetic acid), 5 mL of *Solution B* (8 g of potassium iodide dissolved in 20 mL of water), 20 mL of glacial acetic acid, and water to make 100 mL. Immediately again spray the plate with hydrogen peroxide TS. Cyclosporine appears as a brown spot having an *R<sub>F</sub>* value of about 0.45 on the chromatograms: the *R<sub>F</sub>* value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution. [NOTE—Disregard any spots at the origin.]

**B:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for cyclosporine, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Bacterial endotoxins** (85)—Prepare the test specimen as follows, using USP Endotoxin RS. Make a 1:10 dilution of the Injection with Water for Injection. Add 0.1 mL of the resulting suspension and 0.1 mL of appropriately constituted LAL reagent to a suitable pyrogen-free test tube, and mix on a vortex mixer for about 5 seconds: the article under test contains not more than 0.84 USP Endotoxin Unit per mg of cyclosporine.

**Sterility** (71): meets the requirements.

**Alcohol content** (where present)—

**Internal standard solution**—Mix 3 mL of *n*-propyl alcohol and 50 mL of butyl alcohol.

**Standard stock solution**—Transfer about 1.6 g of dehydrated alcohol, accurately weighed, to a 25-mL volumetric flask, dilute with butyl alcohol to volume, and mix.

**Standard preparation**—Transfer 5.0 mL of *Standard stock solution* and 6.0 mL of *Internal standard solution* to a 25-mL

volumetric flask, dilute with butyl alcohol to volume, and mix.

**Test preparation**—Transfer an accurately weighed portion of Injection, equivalent to about 320 mg of  $C_2H_5OH$ , to a 25-mL volumetric flask, add 6.0 mL of *Internal standard solution*, dilute with butyl alcohol to volume, and mix.

**Chromatographic system**—The gas chromatograph is equipped with a flame-ionization detector and contains a 2-mm  $\times$  2-m glass column packed with support  $S_3$ . The injection port is maintained at a temperature of about 280°, the detector is maintained at about 290°, and the column is maintained at 145° for 8 minutes and is programmed thereafter to rise to 270° at a rate of 32° per minute. Nitrogen is used as the carrier gas, flowing at a rate of about 35 mL per minute. [NOTE—Make adjustments if necessary to obtain satisfactory chromatography.]

**System suitability**—Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*; the relative standard deviation for replicate injections is not greater than 2.0%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Inject separate suitable portions (about 1  $\mu$ L) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The elution order is alcohol, *n*-propyl alcohol, and butyl alcohol. Calculate the quantity, in mg, of  $C_2H_5OH$  in the portion of Injection taken by the formula:

$$25C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of  $C_2H_5OH$  in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios of the alcohol peak to the *n*-propyl alcohol internal standard peak obtained from the *Test preparation* and the *Standard preparation*, respectively: it contains between 80.0% and 120.0% of the labeled amount of  $C_2H_5OH$ .

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, water, methanol, and phosphoric acid (550:400:50:0.5), making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyclosporine RS in methanol to obtain a solution having a known concentration of about 0.5 mg per mL. Use this solution promptly after preparation.

**Assay preparation 1** (where it is represented as being in a single-dose container)—Using a suitable hypodermic needle and syringe, withdraw all of the withdrawable contents from 1 container of Injection, and dilute quantitatively with methanol to obtain a solution containing about 0.5 mg of cyclosporine per mL. Use this solution promptly after preparation.

**Assay preparation 2** (where the label states the quantity of cyclosporine in a given volume)—Dilute an accurately measured volume of Injection quantitatively with methanol to obtain a solution containing about 0.5 mg of cyclosporine per mL. Use this solution promptly after preparation.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 4.6-mm  $\times$  25-cm analytical column that contains packing L16. The column is maintained at 70°. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor,  $K'$ , is not less than 3 and not more than 10; the column efficiency is not less than 700 theoretical plates; the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cyclosporine ( $C_{26}H_{111}N_{11}O_{12}$ ) withdrawn from the container or in each mL of the Injection taken by the same formula:

$$(L / D)(CP / 1000)(r_U / r_S)$$

in which  $L$  is the labeled quantity, in mg, of cyclosporine in the container or in each mL of Injection;  $D$  is the concentration, in mg of cyclosporine per mL, of *Assay preparation 1* or *Assay preparation 2* based on the labeled quantity in the container or in the volume of Injection taken and the extent of dilution, respectively;  $C$  is the concentration, in mg per mL, of USP Cyclosporine RS in the *Standard preparation*;  $P$  is the purity, in  $\mu$ g per mg, of USP Cyclosporine RS; and  $r_U$  and  $r_S$  are the peak responses obtained from *Assay preparation 1* or *Assay preparation 2* and the *Standard preparation*, respectively.

## Cyclosporine Oral Solution

» Cyclosporine Oral Solution is a solution of Cyclosporine in a suitable vehicle. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cyclosporine ( $C_{62}H_{111}N_{11}O_{12}$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Cyclosporine RS

#### Identification—

**A:** Using a solution of it in a mixture of methanol and chloroform (4:1) containing about 1 mg of cyclosporine per mL (test solution) and a Standard solution containing 1 mg of USP Cyclosporine RS in the same solvent mixture, proceed as directed in *Identification* test A under *Cyclosporine Injection*, beginning with "Separately apply 10- $\mu$ L portions of the test solution": the Oral Solution meets the requirements of the test.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

#### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

#### Alcohol content (where present)—

**Internal standard solution, Chromatographic system, and System suitability**—Proceed as directed in the test for *Alcohol content* under *Cyclosporine Injection*.

**Standard stock solution**—Transfer about 2.5 g of dehydrated alcohol, accurately weighed, to a 50-mL volumetric flask, dilute with butyl alcohol to volume, and mix.

**Standard preparation**—Transfer 5.0 mL of *Standard stock solution* and 6.0 mL of *Internal standard solution* to a 25-mL volumetric flask, dilute with butyl alcohol to volume, and mix.

**Test preparation**—Transfer an accurately weighed portion of Oral Solution, equivalent to about 250 mg of  $C_2H_5OH$ , to a 25-mL volumetric flask, add 6.0 mL of *Internal standard solution*, dilute with butyl alcohol to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the test for *Alcohol content* under *Cyclosporine Injection*. Calculate the quantity, in mg, of  $C_2H_5OH$  in the portion of Oral Solution taken by the formula:

$$25C(R_U / R_S)$$

in which the terms are as defined therein: between 80.0% and 120.0% of the labeled amount of  $C_2H_5OH$  is found.

#### Assay—

**Mobile phase**—Prepare as directed in the Assay under *Cyclosporine Injection*.

**Solvent mixture**—Prepare a mixture of methanol and chloroform (4:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyclosporine RS in *Solvent mixture* to obtain a solution having a known concentration of about 1 mg per mL. Use this solution promptly after preparation.

**Assay preparation**—Quantitatively dilute an accurately measured volume of Oral Solution with *Solvent mixture* to obtain a solution containing about 1 mg of cyclosporine per mL. Use this solution promptly after preparation.

**Chromatographic system**—Proceed as directed for *Chromatographic system* in the Assay under *Cyclosporine Injection*, except to maintain the column at 50° instead of 70°.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cyclosporine ( $C_{62}H_{111}N_{11}O_{12}$ ) in each mL of the Oral Solution taken by the formula:

$$(L/D)(CP/1000)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of cyclosporine in each mL of Oral Solution taken; *D* is the concentration, in mg per mL, of the *Assay preparation*, based on the labeled quantity of cyclosporine in the volume of Oral Solution taken and the extent of dilution; *C* is the concentration, in mg per mL, of USP Cyclosporine RS in the *Standard preparation*; *P* is the purity, in  $\mu$ g per mg, of USP Cyclosporine RS; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cyproheptadine Hydrochloride

$C_{21}H_{21}N \cdot HCl \cdot 1\frac{1}{2}H_2O$  350.88

Piperidine, 4-(5*H*-dibenzo[*a,d*]cyclohepten-5-ylidene)-1-methyl-, hydrochloride, sesquihydrate.

4-(5*H*-Dibenzo[*a,d*]cyclohepten-5-ylidene)-1-methylpiperidine hydrochloride sesquihydrate [41354-29-4].

Anhydrous 323.87 [969-33-5].

» Cyproheptadine Hydrochloride contains not less than 98.5 percent and not more than 100.5 percent of  $C_{21}H_{21}N \cdot HCl$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Cyproheptadine Hydrochloride RS

#### Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 16  $\mu$ g per mL.

*Medium:* alcohol.

Absorptivities at 286 nm do not differ by more than 3.0%.

**C:** Dissolve 100 mg of Cyproheptadine Hydrochloride in 10 mL of methanol. Place 1 drop of the solution on a filter paper, dry, and view under short-wavelength UV light: a bright blue fluorescence is observed.

**Acidity**—Dissolve 1.0 g of Cyproheptadine Hydrochloride in 25 mL of methanol, add methyl red TS, and titrate with 0.10 N sodium hydroxide: not more than 0.15 mL is required (0.05% as HCl).

**Water, Method I** (921): between 7.0% and 9.0%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.003%.

**Assay**—Dissolve about 650 mg of Cyproheptadine Hydrochloride, accurately weighed, in 50 mL of glacial acetic acid, heating to dissolve. Cool, add 10 mL of mercuric acetate TS, 0.5 mL of acetic anhydride, and 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 32.39 mg of  $C_{21}H_{21}N \cdot HCl$ .

## Cyproheptadine Hydrochloride Oral Solution

» Cyproheptadine Hydrochloride Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cyproheptadine hydrochloride ( $C_{21}H_{21}N \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Cyproheptadine Hydrochloride RS

**Identification**—Place about 50 mL of Oral Solution in a separator, add 25 mL of sodium bicarbonate solution (2 in 100), and extract with three 15-mL portions of isoctane. Wash the combined isoctane extracts with 15 mL of sodium bicarbonate solution (2 in 100), and discard the washing. Evaporate the isoctane solution on a steam bath to dryness, and dissolve the residue in 1 mL of carbon disulfide, filtering if necessary. Determine the IR absorption spectrum as directed under *Identification—Organic Nitrogenous Bases* (181), obtaining the spectrum of USP Cyproheptadine Hydrochloride RS as directed: the Oral Solution meets the requirements of the test.

**pH** (791): between 3.5 and 4.5.

#### Assay—

**Methanesulfonic acid solution, Mobile phase, and Chromatographic system**—Proceed as directed in the Assay under *Cyproheptadine Hydrochloride Tablets*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyproheptadine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.02 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 2 mg of cyproheptadine hydrochloride, to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix. Pass the solution through a filter having a 0.45- $\mu$ m or finer porosity.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of cyproheptadine hydrochloride ( $C_{21}H_{21}N \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cyproheptadine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the cyproheptadine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cyproheptadine Hydrochloride Tablets

» Cyproheptadine Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{21}H_{21}N \cdot HCl$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Cyproheptadine Hydrochloride RS

**Identification**—Tablets meet the requirements under *Identification*—Organic Nitrogenous Bases (181).

**Dissolution** (711)—

*Medium*: 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of  $C_{21}H_{21}N \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 285 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Cyproheptadine Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{21}H_{21}N \cdot HCl$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Methanesulfonic acid solution**—Prepare a solution of methanesulfonic acid in water (3:1000).

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile, isopropyl alcohol, and *Methanesulfonic acid solution* (20:15:65); while mixing adjust with triethylamine to a pH of  $4.0 \pm 0.05$ . Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyproheptadine Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 0.08 mg per mL.

**Assay preparation**—Transfer a number of Tablets, accurately weighed, equivalent to 80 mg of cyproheptadine hydrochloride, to a 1-liter volumetric flask, dissolve by sonication in 500 mL of *Mobile phase* for 15 minutes, and agitate for 30 minutes. Dilute with *Mobile phase* to volume, and mix. Pass through a filter having a 0.45- $\mu$ m or finer porosity.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 285-nm detector and a 3.9-mm  $\times$  15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as di-

rected for *Procedure*: the tailing factor is not more than 2.5; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{21}H_{21}N \cdot HCl$  in each of the Tablets taken by the formula:

$$1000(C / N)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cyproheptadine Hydrochloride RS in the *Standard preparation*; N is the number of Tablets taken for the *Assay preparation*; and  $r_U$  and  $r_S$  are the cyproheptadine peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cyromazine

$C_6H_{10}N_6$  166.18

N-Cyclopropyl-1,3,5-triazine-2,4,6-triamine.

2-Cyclopropylamino-4,6-diamino-s-triazine [66215-27-8].

» Cyromazine contains not less than 98.0 percent and not more than 102.0 percent of  $C_6H_{10}N_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Cyromazine RS

**Identification**—

**A: Infrared Absorption** (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range** (741): between 219° and 226°.

**Loss on drying** (731)—Dry it at 105° to a constant weight: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Assay**—

**Mobile phase**—Mix 930 mL of water, 3.72 g of dibasic potassium phosphate, and 6.48 g of monobasic potassium phosphate. Add 50 mL of methanol and 20 mL of acetonitrile, and mix. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cyromazine RS in methanol to obtain a solution having a known concentration of about 0.50 mg per mL. Dilute an aliquot of the resulting solution with *Mobile phase* to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

**Assay preparation**—Dissolve an accurately weighed quantity of Cyromazine in methanol to obtain a solution having a known concentration of about 0.50 mg per mL. Dilute an aliquot of the resulting solution with *Mobile phase* to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 214-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the content, in percentage, of C<sub>6</sub>H<sub>10</sub>N<sub>6</sub> in the portion of Cyromazine taken by the formula:

$$100(C_s / C_u)(r_u / r_s)$$

in which C<sub>s</sub> is the concentration, in μg per mL, of USP Cyromazine RS in the *Standard preparation*; C<sub>u</sub> is the concentration, in μg per mL, of Cyromazine in the *Assay preparation*; and r<sub>u</sub> and r<sub>s</sub> are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cysteine Hydrochloride

C<sub>3</sub>H<sub>7</sub>NO<sub>2</sub>S · HCl · H<sub>2</sub>O 175.63

C<sub>3</sub>H<sub>7</sub>NO<sub>2</sub>S · HCl 157.62  
L-Cysteine hydrochloride monohydrate [7048-04-6].  
Anhydrous [52-89-1].

### DEFINITION

Cysteine Hydrochloride is L-cysteine hydrochloride monohydrate and contains NLT 98.5% and NMT 101.5% of L-cysteine hydrochloride (C<sub>3</sub>H<sub>7</sub>NO<sub>2</sub>S · HCl), calculated on the dried basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** <197K>

### ASSAY

#### Change to read:

#### PROCEDURE

**Sample:** 250 mg of Cysteine Hydrochloride

**Blank:** Proceed as directed in the *Analysis* without the *Sample*.

#### Titrimetric system

(See *Titrimetry* <541>.)

**Mode:** Residual titration

**Titrant:** 0.1 N iodine VS

**Back titrant:** 0.1 N sodium thiosulfate VS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to an iodine flask. Add 20.0 mL of water and 4 g of potassium iodide, and mix. Cool the solution in an ice bath, and add 5 mL of 3 N hydrochloric acid and 25.0 mL of 0.1 N iodine VS. • Insert the stopper, and allow to stand in the dark for 20 min, while remaining in the ice bath. • (ERR 1-Jul-2012) Titrate the excess iodine with the *Back titrant*. • Titrate the starch TS as the endpoint is approached. Perform the *Blank* determination. Calculate the percentage of cysteine hydrochloride (C<sub>3</sub>H<sub>7</sub>NO<sub>2</sub>S · HCl) in the *Sample* taken:

teine hydrochloride (C<sub>3</sub>H<sub>7</sub>NO<sub>2</sub>S · HCl) in the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times N \times F] / W\} \times 100$$

V<sub>B</sub> = Back titrant volume consumed by the *Blank* (mL)

V<sub>S</sub> = Back titrant volume consumed by the *Sample* (mL)

N = actual normality of the *Back titrant* (mEq/mL)

F = equivalency factor, 157.6 mg/mEq

W = *Sample* weight (mg)

**Acceptance criteria:** 98.5%–101.5% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** <281>: NMT 0.4%

- **CHLORIDE AND SULFATE**, *Sulfate* <221>

**Standard solution:** 0.10 mL of 0.020 N sulfuric acid

**Sample:** 0.33 g of Cysteine Hydrochloride

**Acceptance criteria:** NMT 0.03%.

- **IRON** <241>: NMT 30 ppm

- **HEAVY METALS**, *Method I* <231>: NMT 15 ppm

### RELATED COMPOUNDS

**N-Ethylmaleimide solution:** 40 mg/mL of N-ethylmaleimide in alcohol

**Standard stock solution:** Dissolve 20 mg of USP L-Cysteine Hydrochloride RS in 10.0 mL of water. Add 10.0 mL of *N-Ethylmaleimide solution*, and mix. Allow the solution to stand for 5 min before using.

**Standard solution:** 0.05 mg/mL from *Standard stock solution* in water. [NOTE—This solution has a concentration equivalent to 0.5% of that of the *Sample solution*.]

**System suitability solution:** Transfer 10 mg of USP L-Tyrosine RS and 10 mL of the *Standard stock solution* to a 25-mL volumetric flask. Dilute with water to volume.

**Sample stock solution:** Transfer 0.2 g of Cysteine Hydrochloride to a 10-mL volumetric flask, dissolve, and dilute with water to volume.

**Sample solution:** To 5.0 mL of the *Sample stock solution* add 5.0 mL of *N-Ethylmaleimide solution*, and mix. Allow the solution to stand for 5 min before using.

### Chromatographic system

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture

**Application volume:** 5 μL

**Developing solvent system:** Butyl alcohol, glacial acetic acid, and water (3:1:1)

**Spray reagent:** 2 mg/mL of ninhydrin in a mixture of butyl alcohol and 2 N acetic acid (95:5)

### System suitability

**Suitability requirements:** The chromatogram of the *System suitability solution* exhibits two clearly separated spots.

### Analysis

**Samples:** *Standard solution*, *System suitability solution*, and *Sample solution*.

After air-drying the plate, spray with *Spray reagent*, and heat between 100° and 105° for 15 min. Examine the plate under white light.

**Acceptance criteria:** Any secondary spot of the *Sample solution* is not larger or more intense than the principal spot of the *Standard solution*.

**Individual impurities:** NMT 0.5%

**Total impurities:** NMT 2.0%

### SPECIFIC TESTS

- **OPTICAL ROTATION**, *Specific Rotation* <781S>

**Sample solution:** 80 mg/mL in 6 N hydrochloric acid

**Acceptance criteria:** +5.7° to +6.8°

- **LOSS ON DRYING** <731>: Dry a sample at room temperature at a pressure not exceeding 5 mm of mercury for 24 h: it loses 8.0%–12.0% of its weight.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP L-Cysteine Hydrochloride RS  
USP L-Tyrosine RS

**Cysteine Hydrochloride Injection**

» Cysteine Hydrochloride Injection is a sterile solution of Cysteine Hydrochloride in Water for Injection. It contains not less than 85.0 percent and not more than 115.0 percent of the labeled amount of  $C_3H_7NO_2S \cdot HCl \cdot H_2O$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—

USP L-Cysteine Hydrochloride RS  
USP Endotoxin RS

**Identification**—

**A:** To 2 mL of Injection add 3 mL of water, and mix. Add 10 mL of cupric sulfate TS: a bluish-gray precipitate is formed.

**B:** To 2 mL of Injection add 3 mL of water, and mix. Add 2 mL of 3 N sodium hydroxide and 2 drops of sodium nitroferricyanide solution (1 in 20): a red-purple color is produced, and it rapidly changes to yellow.

**Bacterial endotoxins** (85)—It contains not more than 0.7 USP Endotoxin Unit per mg of cysteine hydrochloride.

**pH** (791): between 1.0 and 2.5.

**Heavy metals, Method II** (231): 2 ppm.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Standard stock preparation**—Dissolve an accurately weighed quantity of USP L-Cysteine Hydrochloride RS in nitrogen-saturated water to obtain a solution having a known concentration of about 1 mg per mL.

**Standard preparation**—Transfer 20.0 mL of *Standard stock preparation* to a 200-mL volumetric flask, dilute with nitrogen-saturated 1.0 N sodium hydroxide to volume, and mix.

**Assay preparation**—Dilute an accurately measured volume of Injection, equivalent to about 250 mg of cysteine hydrochloride, quantitatively and stepwise with nitrogen-saturated 1.0 N sodium hydroxide, to obtain a solution having a concentration of about 0.1 mg per mL.

**Procedure**—Transfer a suitable amount of *Standard preparation* to a polarographic cell. With mercury dropping from the electrode, lower the dropping mercury electrode of a polarograph so that the end is submerged in the liquid. Bubble oxygen-free, water-saturated nitrogen through the liquid for 15 minutes. Record the polarogram from  $-0.2$  volt to  $-1.10$  volts, using a saturated calomel electrode as the reference electrode. In a similar manner, record the polarograms obtained using portions of the *Assay preparation* and of the nitrogen-saturated 1.0 N sodium hydroxide. Determine the height of the diffusion current wave at  $-0.4$  volt. Calculate the quantity, in mg, of  $C_3H_7NO_2S \cdot HCl \cdot H_2O$  in each mL of the Injection taken by the formula:

$$2500(C/V)[(i_a)_U / (i_a)_S]$$

in which C is the concentration, in mg per mL, of USP L-Cysteine Hydrochloride RS. In the *Standard preparation*, V is the volume, in mL, of Injection taken; and  $(i_a)_U$  and  $(i_a)_S$  are the observed diffusion currents, corrected for the diffu-

sion current of the 0.1 N sodium hydroxide, of the *Assay preparation* and the *Standard preparation*, respectively.

**Cytarabine**

$C_9H_{13}N_3O_5$  243.22

2(1H)-Pyrimidinone, 4-amino-1- $\beta$ -D-arabinofuranosyl-1- $\beta$ -D-Arabinofuranosylcytosine [147-94-4].

» Cytarabine contains not less than 98.0 percent and not more than 102.0 percent of  $C_9H_{13}N_3O_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Cytarabine RS  
USP Endotoxin RS  
USP Uracil Arabinoside RS

**Identification**—

**A:** *Infrared Absorption* (197M): previously dried at a pressure of not more than 5 mm of mercury at  $60^\circ$  for 3 hours.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between  $+154^\circ$  and  $+160^\circ$ .

*Test solution:* 10 mg per mL, in water.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at  $60^\circ$  for 3 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Heavy metals, Method II** (231): 0.001%.

**Chromatographic purity**—

**Phosphate buffer**—Prepare a solution containing 0.01 M monobasic sodium phosphate and 0.01 M dibasic sodium phosphate in a suitable container. Adjust with 0.1 M sodium hydroxide or 0.1 M phosphoric acid to a pH of 7.0.

**Solution A**—Prepare a filtered and degassed mixture of *Phosphate buffer* and methanol (49:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Prepare this solution fresh daily.

**Solution B**—Prepare a filtered and degassed mixture of *Phosphate buffer* and methanol (7:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Prepare this solution fresh daily.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed under *Chromatographic system*.

**System suitability solution**—Dissolve suitable quantities of uridine, USP Uracil Arabinoside RS, and USP Cytarabine RS in water to obtain a solution containing about 0.02, 0.02, and 5.0 mg per mL, respectively.

**Standard solution**—Dissolve an accurately weighed quantity of USP Cytarabine RS in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 4  $\mu$ g per mL.

**Test solution**—Transfer about 25 mg of Cytarabine, accurately weighed, to a 5.0-mL volumetric flask, dissolve in and

dilute with water to volume, and mix. [NOTE—Prepare this solution fresh daily.]

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1 mL per minute. The chromatograph is programmed to provide variable mixtures of *Solution A* and *Solution B*, the percentage of *Solution B* being 0% at the time of injection. This composition is held for 10 minutes. *Solution B* is then linearly increased to 100% over a period of 10 minutes. After maintaining this composition for 5 minutes, the percentage of *Solution B* is then linearly decreased to 0% over a period of 5 minutes. This composition is maintained for 20 minutes to equilibrate the system. Chromatograph the *System suitability solution*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.55 for uracil, 1.14 for uridine, 1.62 for uracil arabinoside, and 1.0 for cytarabine; and the resolution, *R*, between cytarabine and uridine is not less than 1.25. Chromatograph the *Standard solution*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of uracil arabinoside in the portion of Cytarabine taken by the formula:

$$500(C / W)(r_i / 1.34r_s)$$

in which *C* is the concentration, in mg per mL, of USP Cytarabine RS in the *Standard solution*; *W* is the weight, in mg, of the specimen, 1.34 is the relative response factor for uracil arabinoside; *r<sub>i</sub>* is the peak response of uracil arabinoside in the *Test solution*; and *r<sub>s</sub>* is the peak response of USP Cytarabine RS in the *Standard solution*: not more than 0.30% is found.

Calculate the percentage of all other impurities in the portion of Cytarabine taken by the formula:

$$500(C / W)(r_i / F_r)$$

in which *C* is the concentration, in mg per mL, of USP Cytarabine RS in the *Standard solution*; *W* is the weight, in mg, of the specimen; *r<sub>i</sub>* is the peak response of each impurity in the *Test solution*; *r<sub>s</sub>* is the peak response of USP Cytarabine RS in the *Standard solution*; and *F<sub>r</sub>*, the relative response factor, equals 2.5 for the uracil peak, with a relative retention time of 0.55, 1.5 for peaks with relative retention times of 0.38, 0.43, and 1.14, and 1.0 for all other peaks. Not more than 0.10% of any individual impurity is found, and not more than 0.30% of total impurities is found (including uracil arabinoside).

**Other requirements**—Where the label states that Cytarabine is sterile, it meets the requirements for *Sterility Tests* <71> and for *Bacterial endotoxins* under *Cytarabine for Injection*. Where the label states that Cytarabine must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Cytarabine for Injection*.

#### Assay—

**Phosphate buffer**—Dissolve 0.73 g of monobasic sodium phosphate and 1.4 g of dibasic sodium phosphate in 1 L of water, mix, and filter.

**Mobile phase**—Prepare a filtered and degassed mixture of *Phosphate buffer* and methanol (95:5). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Cytarabine RS in water, and dilute quantita-

tively, and stepwise if necessary, with water to obtain a solution having a known concentration of about 0.1 mg per mL.

**Resolution solution**—Dissolve an accurately weighed quantity of USP Uracil Arabinoside RS in *Standard preparation*, and dilute quantitatively, and stepwise if necessary, with *Standard preparation* to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Transfer about 10 mg of Cytarabine, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for cytarabine and 1.3 for uracil arabinoside; and the resolution, *R*, between cytarabine and uracil arabinoside is not less than 2.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%. [NOTE—After chromatography has been completed, flush the column with a mixture of water and methanol (7:3).]

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>9</sub>H<sub>13</sub>N<sub>3</sub>O<sub>5</sub> in the portion of Cytarabine taken by the formula:

$$100C(r_u / r_s)$$

in which *C* is the concentration, in mg per mL, of USP Cytarabine RS in the *Standard preparation*; and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Cytarabine for Injection

» Cytarabine for Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of cytarabine (C<sub>9</sub>H<sub>13</sub>N<sub>3</sub>O<sub>5</sub>).

**Packaging and storage**—Preserve in *Containers for Sterile Solids* as described under *Injections* <1>.

#### USP Reference standards <11>—

USP Cytarabine RS

USP Uracil Arabinoside RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 0.07 USP Endotoxin Unit per mg of cytarabine.

**pH** <791>: between 4.0 and 6.0, in a solution containing the equivalent of 10 mg of cytarabine per mL.

**Water, Method I** <921>: not more than 3.0%.

**Other requirements**—It meets the requirements for *Sterility Tests* <71>, *Uniformity of Dosage Units* <905>, and *Labeling* under *Injections* <1>. The drug substance in the vial meets the requirements for *Cytarabine*.

**Assay—**

*Phosphate buffer, Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Proceed as directed in the Assay under Cytarabine.

*Assay preparation*—Separately constitute 5 vials of Cytarabine for Injection in a volume of water, accurately measured, corresponding to the volume specified in the labeling. Pool and mix the constituted solutions in a suitable container. Transfer an accurately measured volume of the constituted solution, equivalent to about 100 mg of cytarabine, to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 50-mL volumetric flask, dilute with water to volume, and mix.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_9H_{13}N_3O_5$  in the portion of constituted solution taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Cytarabine RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dacarbazine

$C_6H_{10}N_6O$  182.18

1H-Imidazole-4-carboxamide, 5-(3,3-dimethyl-1-triazenyl)-.  
5-(3,3-Dimethyl-1-triazeno)imidazole-4-carboxamide  
[4342-03-4].

» Dacarbazine contains not less than 97.0 percent and not more than 102.0 percent of  $C_6H_{10}N_6O$ .

**Caution**—Great care should be taken in handling Dacarbazine, as it is a potent cytotoxic agent.

**Packaging and storage**—Preserve in tight, light-resistant containers, in a refrigerator.

### USP Reference standards (11)—

USP Dacarbazine RS

USP Dacarbazine Related Compound A RS

5-Aminoimidazole-4-carboxamide hydrochloride.

USP Dacarbazine Related Compound B RS

2-Azahypoxanthine.

$C_4H_3N_5O$  137.10

**Identification**—The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Dacarbazine RS.

**Residue on ignition** (281): not more than 0.1%.

**Related compounds**—Dissolve an accurately weighed quantity of Dacarbazine in 0.1 N hydrochloric acid to obtain a solution having a concentration of 40 mg per mL, and apply 5  $\mu$ L of the solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Apply, separately, 5  $\mu$ L of a methanolic solution containing 0.40 mg of USP Dacarbazine Related Compound A RS per mL, and 5  $\mu$ L of an aqueous solution containing 0.40 mg of USP Dacarbazine Related Compound B RS per mL. Develop the chromatogram in a mixture of butanol, water, and acetic acid (5:2:1), until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by viewing under short-wavelength UV light: any spots obtained from the test solution are not greater in size or intensity than the spots, occurring at the respective  $R_f$  values, produced by the Standard solutions, corresponding to not more than 1.0% of dacarbazine related compound A and not more than 1.0% of dacarbazine related compound B.

**Assay**—[NOTE—Throughout this procedure, avoid exposing Dacarbazine and its solutions to light.]

**Standard preparations**—Transfer about 30 mg of USP Dacarbazine RS, accurately weighed, to a 50-mL volumetric flask, add 0.1 N hydrochloric acid to volume, and mix (*Standard stock solution*). Dilute a portion of *Standard stock solution* quantitatively and stepwise with 0.1 N hydrochloric acid to obtain an *Acidic standard preparation* having a known concentration of about 6  $\mu$ g per mL. Dilute a portion of *Standard stock solution* quantitatively and stepwise with pH 7.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) to obtain a *Neutral standard preparation* having a known concentration of about 6  $\mu$ g per mL.

**Assay preparations**—Prepare as directed under *Standard preparations*, except to use about 30 mg of Dacarbazine, accurately weighed.

**Procedure**—Concomitantly determine the absorbances of the *Acidic standard preparation* and the *Acidic assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 323 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Concomitantly determine the absorbances of the *Neutral standard preparation* and the *Neutral assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 329 nm, using pH 7.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*) as the blank. Calculate the quantity, in mg, of  $C_6H_{10}N_6O$  in the portion of Dacarbazine taken by the formula:

$$5C[(A_{323} + A_{329})_U / (A_{323} + A_{329})_S]$$

in which C is the concentration, in  $\mu$ g per mL, of USP Dacarbazine RS in the *Standard preparations*, and the parenthetical expressions are the sums of the absorbances of the *Assay preparations* (U) and the *Standard preparations* (S), respectively, measured at the wavelengths indicated by the subscripts.

## Dacarbazine for Injection

» Dacarbazine for Injection is a sterile, freeze-dried mixture of Dacarbazine and suitable buffers or diluents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_6H_{10}N_6O$ .

**Caution**—Great care should be taken to prevent inhaling particles of Dacarbazine for Injection and exposing the skin to it.

**Packaging and storage**—Preserve in single-dose or multiple-dose *Containers for Sterile Solids* as described under *Injections* (1), preferably of Type I glass, protected from light.

### USP Reference standards (11)—

USP Dacarbazine RS

USP Dacarbazine Related Compound B RS

2-Azahypoxanthine.

$C_4H_3N_5O$  137.10

USP Endotoxin RS

**Completeness of solution**—When dissolved as directed in the labeling, it yields a clear, pale yellow to yellow solution.

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* (1).

### Identification—

**A:** Dissolve a suitable quantity of Dacarbazine for Injection in water to obtain a solution having a concentration of 10 mg of dacarbazine per mL. Apply separately 1  $\mu$ L of the freshly prepared solution and 1  $\mu$ L of an aqueous solution, containing 10 mg each of USP Dacarbazine RS and citric acid per mL, to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram in a solvent system consisting of a mixture of isopropyl alcohol and 1 N ammonium hydroxide (3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Spray the plate evenly with a freshly prepared solution containing 1% of ferric chloride and 1% of potassium ferricyanide (prepared by mixing 5 mL of a 10% aqueous solution of ferric chloride with 5 mL of a 10% aqueous solution of potassium ferricyanide and diluting with water to 50 mL). Dacarbazine

appears as an intense blue spot on a light yellow background: the  $R_f$  value of the spot obtained from the test solution corresponds to that obtained from the Standard solution.

**B:** To 1 mL of a solution (1 in 100) in a test tube add a few crystals of periodic acid and 4 drops of methanol. Shake, and after 1 minute add 5 mL of a 0.2% acetylacetone reagent solution (prepared by mixing 15.0 g of ammonium acetate, 0.30 mL of glacial acetic acid, and 0.20 mL of acetylacetone in a 100-mL volumetric flask, adding water to volume, and mixing). Shake, and place in a water bath maintained at a temperature of 60°: an intense yellow color develops in a few minutes (*presence of mannitol*).

**C:** To 2 drops of an aqueous solution (1 in 100) in a 15-mL test tube add 10 mL of a solution prepared by mixing 10 mL of acetic anhydride with 30 mL of pyridine: an intense yellow color is produced immediately and after a few minutes becomes red-violet (*presence of citric acid*).

**Bacterial endotoxins** (85)—It contains not more than 0.52 USP Endotoxin Unit per mg of dacarbazine.

**pH** (791): between 3.0 and 4.0, in a solution containing an amount of Dacarbazine for Injection equivalent to about 1 g of dacarbazine in 100 mL of water.

**Water, Method I** (921): not more than 1.5%.

**Limit of 2-azahypoxanthine**—[NOTE—The *Mobile phase* employed in this procedure is corrosive. The system should be rinsed well with methanol following completion of analysis.]

*Mobile phase*—Transfer 2.2 g of docusate sodium to a 1000-mL volumetric flask, dissolve in a mixture of 100 mL of water and 15 mL of glacial acetic acid, and dilute with water to volume. Filter the solution through a 0.5- $\mu$ m porosity filter. Prepare this solution fresh daily.

*Standard solution*—Prepare a solution of USP Dacarbazine Related Compound B RS to contain 0.04 mg per mL.

*Test solution*—Constitute the contents of 1 vial of Dacarbazine for Injection. Using the contents of the constituted vial, dilute quantitatively with water to obtain a solution containing 4 mg of dacarbazine per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.2 mL per minute. Chromatograph five replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph by means of a suitable sampling valve or high-pressure microsyringe. Measure the peak responses at corresponding retention times obtained from the *Standard solution* and the *Test solution*, and calculate the quantity, in mg, of 2-azahypoxanthine monohydrate in the dacarbazine taken by the formula:

$$(CV)(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dacarbazine Related Compound B RS in the *Standard solution*; V is the final volume, in mL, of the *Test solution*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 1.0% is found.

**Other requirements**—It meets the requirements for *Sterility Tests* (71), *Uniformity of Dosage Units* (905) and *Labeling under Injections* (1).

**Assay**—Dissolve the contents of not fewer than 10 containers of Dacarbazine for Injection in 0.1 N hydrochloric acid. Transfer and combine the solutions quantitatively rinsing as necessary with 0.1 N hydrochloric acid. Dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric

acid to obtain a solution containing about 0.4 mg per mL. Transfer 2.0 mL of this solution to a 250-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix. Dissolve an accurately weighed quantity of USP Dacarbazine RS in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a Standard solution having a known concentration of about 3.2  $\mu$ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 323 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the average quantity, in mg, of  $C_6H_{10}N_6O$  in each container of Dacarbazine for Injection taken by the formula:

$$125(VC / N)(A_U / A_S)$$

in which V is the volume, in mL, of the solution produced by dilution of the combined container contents to a concentration of 0.4 mg per mL taking account of dilution factors in the case of stepwise dilution; C is the concentration, in mg per mL, of USP Dacarbazine RS in the Standard solution; N is the number of vials taken; and  $A_U$  and  $A_S$  are the absorbances of the solution of Dacarbazine for Injection and the Standard solution, respectively.

## Dactinomycin

$C_{62}H_{86}N_{12}O_{16}$  1255.42

Actinomycin D.

Actinomycin D [50-76-0].

» Dactinomycin contains not less than 950  $\mu$ g and not more than 1030  $\mu$ g of  $C_{62}H_{86}N_{12}O_{16}$  per mg, calculated on the dried basis.

**Caution**—Great care should be taken to prevent inhaling particles of Dactinomycin and exposing the skin to it.

**Packaging and storage**—Preserve in tight containers, protected from light and excessive heat.

**USP Reference standards** (11)—

USP Dactinomycin RS

USP Endotoxin RS

**Identification**—

**A:** *Ultraviolet Absorption* (197U)—

*Solution:* 25  $\mu$ g per mL.

*Medium:* methanol.

Absorptivity at 445 nm, calculated on the dried basis, is not less than 95.0% and not more than 103.0% of that of USP Dactinomycin RS, the potency of the Reference Standard being taken into account.

*Ratio:*  $A_{240}/A_{445}$  between 1.30 and 1.50.

**B:** The chromatogram obtained from the *Assay preparation* in the Assay exhibits a major peak for dactinomycin, the retention time of which corresponds to that exhibited by the *Standard preparation*, and the chromatogram compares qualitatively to that obtained from the *Standard preparation*.

**Specific rotation** (781S): between  $-293^\circ$  and  $-329^\circ$  measured at 20°.

*Test solution:* 1 mg per mL, in methanol.

**Crystallinity** (695): meets the requirements.

**Bacterial endotoxins** (85)—It contains not more than 100 USP Endotoxin Units per mg.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 5.0% of its weight.

**Assay**—[NOTE—In this procedure, use a freshly prepared *Standard preparation* and *Assay preparation*, protected from light.]

*Mobile phase*—Prepare a suitable mixture of acetonitrile, 0.04 M sodium acetate, and 0.07 M acetic acid (approximately 46:25:25), filter through a membrane filter (1-μm or finer porosity), and degas. [NOTE—The acetonitrile concentration may be varied to provide appropriate *Chromatographic system* performance and to provide a suitable elution time.]

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dactinomycin RS in *Mobile phase*, and dilute quantitatively with *Mobile phase* to obtain a solution having a known concentration of about 1200 μg of dactinomycin per mL.

*Assay preparation*—Dissolve about 30 mg of Dactinomycin, accurately weighed, in *Mobile phase* to make 25.0 mL, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.0 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 1.0%.

*Procedure*—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The retention time is about 25 minutes for Dactinomycin. Calculate the potency, in μg, of C<sub>62</sub>H<sub>86</sub>N<sub>12</sub>O<sub>16</sub> per mg taken by the formula:

$$25(C/W)(r_U/r_S)$$

in which C is the concentration, in μg, of dactinomycin in each mL of the *Standard preparation*; W is the weight, in mg, of Dactinomycin taken; and  $r_U$  and  $r_S$  are the peak responses of the *Assay preparation* and the *Standard preparation*, respectively.

## Dactinomycin for Injection

### DEFINITION

Dactinomycin for Injection is a sterile mixture of Dactinomycin and Mannitol. It contains NLT 90.0% and NMT 120.0% of the labeled amount of C<sub>62</sub>H<sub>86</sub>N<sub>12</sub>O<sub>16</sub>.

[**CAUTION**—Great care should be taken to prevent inhaling particles of Dactinomycin and exposing the skin to it.]

### IDENTIFICATION

#### A. PROCEDURE

*Standard solution:* 25 μg/mL of USP Dactinomycin RS in methanol

*Sample solution:* 25 μg/mL of dactinomycin in methanol

**Acceptance criteria:** The UV absorption spectrum of the *Sample solution* exhibits maxima and minima at the same wavelengths as the *Standard solution*, concomitantly measured.

**Ratio:** A<sub>240</sub>/A<sub>445</sub>, 1.30–1.50

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### PROCEDURE

[NOTE—Use freshly prepared *Standard solution* and *Sample solution*, protected from light.]

*Mobile phase:* Acetonitrile and water (3:2)

*Standard solution:* 250 μg/mL of USP Dactinomycin RS in *Mobile phase*

*Sample solution:* 250 μg/mL of dactinomycin from Dactinomycin for Injection diluted with *Mobile phase*. Filter, if necessary, to obtain a clear solution. [NOTE—Prepare the solution by adding a suitable aliquot of *Mobile phase* to one container of Dactinomycin for Injection.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 2.5 mL/min

**Injection size:** 10 μL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for dactinomycin is 6 min.]

#### Suitability requirements

**Column efficiency:** NLT 1200 theoretical plates

**Tailing factor:** NMT 2

**Relative standard deviation:** NMT 3.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of C<sub>62</sub>H<sub>86</sub>N<sub>12</sub>O<sub>16</sub> in the portion of Dactinomycin for Injection taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Dactinomycin RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of dactinomycin in the *Sample solution* (μg/mL)

**Acceptance criteria:** 90.0%–120.0%

### SPECIFIC TESTS

- PH (791):** 5.5–7.5, in the solution constituted as directed in the labeling
- LOSS ON DRYING (731):** Dry a portion in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 h: it loses NMT 4.0% of its weight.
- OTHER REQUIREMENTS:** It meets the requirements under *Injections* (1).
- BACTERIAL ENDOTOXINS TEST (85):** NMT 100.0 USP Endotoxin Units/mg of dactinomycin.
- STERILITY TESTS (71):** Meets the requirements when tested as directed for *Test for Sterility of the Product to be Examined*, *Membrane Filtration*, each container being constituted aseptically by injecting Sterile Water for Injection through the stopper, and the entire contents of all the containers being collected aseptically with the aid of 200 mL of *Fluid A* before filtering.
- CONSTITUTED SOLUTION:** At the time of use, it meets the requirements for *Injections* (1), *Constituted Solutions*.

### ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Preserve in light-resistant Containers for Sterile Solids as described under *Injections* (1).
- LABELING:** Label it to include the statement "Protect from light."
- USP REFERENCE STANDARDS (11)**
  - USP Dactinomycin RS
  - USP Endotoxin RS

## Danazol

$C_{22}H_{27}NO_2$  337.46

Pregna-2,4-dien-20-yno[2,3-*d*]isoxazol-17-ol, (17 $\alpha$ )-  
17 $\alpha$ -Pregna-2,4-dien-20-yno[2,3-*d*]isoxazol-17-ol  
[17230-88-5].

» Danazol contains not less than 97.0 percent and not more than 102.0 percent of  $C_{22}H_{27}NO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Danazol RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* prepared as directed in the Assay.

**Specific rotation** (781S): between +21° and +27°.

*Test solution:* 10 mg per mL, in chloroform.

**Loss on drying** (731)—Dry it at a pressure not exceeding 5 mm of mercury at 60° to constant weight: it loses not more than 2.0% of its weight.

**Chromatographic purity**—

*Solvent*—Prepare a mixture of chloroform and methanol (9:1).

*Standard solutions*—Dissolve an accurately weighed quantity of USP Danazol RS in *Solvent* to obtain a solution having a known concentration of 1 mg per mL. Dilute quantitatively with *Solvent* to obtain *Standard solutions* having the following compositions:

Standard solution	Dilution	Concentration ( $\mu$ g RS per mL)	Percentage (% for comparison with test specimen)
A	(1 in 2)	500	1.0
B	(1 in 4)	250	0.5
C	(1 in 10)	100	0.2
D	(1 in 20)	50	0.1

*Test solution*—Dissolve an accurately weighed quantity of Danazol in *Solvent* to obtain a solution containing 50 mg per mL.

*Procedure*—Apply separately 5  $\mu$ L of the *Test solution* and 5  $\mu$ L of each *Standard solution* to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Position the plate in a chromatographic chamber and develop the chromatograms in a solvent system consisting of a mixture of cyclohexane and ethyl acetate (7:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate in warm, circulating air. Examine the plate under short-wavelength UV light. Expose the plate to iodine vapors for 5 minutes. Compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatograms of the *Standard solutions*: the sum of the intensities of secondary spots obtained from the *Test solution* corresponds to not more than

1.0% of related compounds, with no single impurity corresponding to more than 0.5%.

**Assay**—Dissolve about 100 mg of Danazol, accurately weighed and previously dried, in about 50 mL of alcohol in a 100-mL volumetric flask, swirl until dissolved, dilute with alcohol to volume, and mix. Transfer 2.0 mL of this solution to a 100-mL volumetric flask, dilute with alcohol to volume, and mix. Similarly, dissolve an accurately weighed quantity of USP Danazol RS in alcohol to obtain a Standard solution having a known concentration of about 20  $\mu$ g per mL. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 285 nm, using alcohol as the blank. Calculate the quantity, in mg, of  $C_{22}H_{27}NO_2$  in the portion of Danazol taken by the formula:

$$5C(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Danazol RS in the Standard solution; and  $A_U$  and  $A_S$  are the absorbances of the solution of Danazol and the Standard solution, respectively.

## Danazol Capsules

» Danazol Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{22}H_{27}NO_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Danazol RS

**Identification**—Shake the contents of a sufficient number of Capsules, equivalent to about 50 mg of Danazol, with 50 mL of chloroform, and filter. Evaporate the filtrate on a steam bath with the aid of a stream of nitrogen to dryness: the IR absorption spectrum of a potassium bromide dispersion of the residue, previously dried, exhibits maxima at the same wavelengths as that of a similar preparation of USP Danazol RS.

**Dissolution** (711)—

*Medium:* 0.75% sodium lauryl sulfate solution; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 30 minutes.

*Procedure*—Determine the amount of  $C_{22}H_{27}NO_2$  dissolved as follows. Remove an aliquot from the solution under test at a point midway between the stirring shaft and the wall of the vessel and approximately midway in depth. Measure the amount in solution in filtered portions of the *Dissolution Medium*, suitably diluted with the *Dissolution Medium*, at the wavelength of maximum absorbance at about 286 nm, with a suitable spectrophotometer, in comparison with a solution of known concentration of USP Danazol RS prepared as follows. Transfer 10 mg of USP Danazol RS, accurately weighed, to a 10-mL volumetric flask, and dissolve in isopropyl alcohol. Transfer 2.0 mL to a 100-mL volumetric flask, dilute with *Dissolution Medium* to volume, and mix.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{22}H_{27}NO_2$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of acetonitrile, methanol, and water (4:3:3). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Danazol RS in *Mobile phase* to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Accurately weigh the contents of not less than 20 Capsules. Mix the contents, and transfer an accurately weighed portion of the powder, equivalent to about 100 mg of danazol, to a 100-mL volumetric flask. Add about 50 mL of *Mobile phase*, and shake by mechanical means for about 10 minutes. Dilute with *Mobile phase* to volume, mix, and filter, discarding the first 5 mL of the filtrate. Pipet 5 mL of the filtrate into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution through a 0.45-μm porosity filter, discarding the first 5 mL of the filtrate.

**Chromatographic system** (see *System Suitability* under *Chromatography* (621))—The liquid chromatograph is equipped with a 270-nm detector and a 3.9-mm × 15-cm column that contains 4-μm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of danazol in the portion of Capsules taken by the formula:

$$500C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Danazol RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dantrolene Sodium

$C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$  399.29  
2,4-Imidazolidinedione, 1-[[[5-(4-nitrophenyl)-2-furanyl]methylene]amino]-, sodium salt, hydrate (2:7).  
1-[[5-(p-Nitrophenyl)furfurylidene]amino]hydantoin sodium salt hydrate [24868-20-0].

» Dantrolene Sodium contains not less than 90.0 percent and not more than 96.0 percent of  $C_{14}H_{10}N_4O_5$ , the free acid form of Dantrolene Sodium, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

### USP Reference standards (11)—

USP Dantrolene RS

USP Dantrolene Related Compound A RS  
5-(4-Nitrophenyl)-2-furaldehyde azine.  
 $C_{22}H_{14}N_4O_6$

USP Dantrolene Related Compound B RS  
5-(4-Nitrophenyl)-2-furaldehyde-2-carboxymethyl semicarbazone.  
 $C_{14}H_{12}N_4O_6$

USP Dantrolene Related Compound C RS  
5-(4-Nitrophenyl)-2-furancarboxyaldehyde.  
 $C_{11}H_7NO_4$

USP Dantrolene Sodium RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** Ignite about 200 mg; the residue meets the requirements of the flame test for *Sodium* (191).

**Water**, *Method Ia* (921): between 14.5% and 17.0%.

**Heavy metals**, *Method II* (231): 0.002%.

### Limit of dantrolene related compound A—

**Test stock solution**—Prepare as directed for the *Assay stock preparation* as directed in the *Assay*.

**Mobile phase**—Prepare a filtered and degassed mixture of acetonitrile and water (80:20). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Dantrolene Related Compound A RS and USP Dantrolene Sodium RS in dimethylformamide to obtain a solution having known concentrations of 17.5 μg per mL of dantrolene related compound A and 50 μg per mL of dantrolene sodium. Dilute with acetonitrile to obtain a solution having concentrations of about 0.35 μg per mL of dantrolene related compound A and 1 μg per mL of dantrolene sodium.

**Test solution**—Dilute the *Test stock solution* with acetonitrile to obtain a solution having a concentration of about 0.175 mg per mL of dantrolene sodium.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor for dantrolene related compound A is not more than 1.5; and the relative standard deviation for replicate injections is not more than 5% for dantrolene related compound A. [NOTE—The dantrolene peak elutes at void volume at approximately 1.5 minutes.]

**Procedure**—Inject equal volumes (about 20 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the response for the dantrolene related compound A peak. Calculate the percentage of dantrolene related compound A in the portion of Dantrolene Sodium taken by the formula:

$$100(r_U / r_S)(C_S / C_T)$$

in which  $r_U$  and  $r_S$  are the peak responses of dantrolene related compound A obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of dantrolene related compound A in the *Standard solution*; and  $C_T$  is the concentration, in mg per mL, of Dantrolene Sodium in the *Test solution*: not more than 0.15% of dantrolene related compound A is found.

### Related compounds—

**Mobile phase**, **System suitability stock solution B**, **Diluent**, and **Chromatographic system**—Prepare as directed in the *Assay*.

**Standard solution**—Dilute quantitatively the *System suitability stock solution B* with *Diluent* to obtain a solution having a known concentration of 0.25 μg per mL each of dantrolene related compound B and dantrolene related compound C.

**Test solution**—Use the *Assay preparation*.

**Procedure**—Inject equal volumes (about 20 μL) of the *Standard solution* and *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of each of the relevant

dantrolene related compounds in the portion of Dantrolene Sodium taken by the formula:

$$100(C_S / C_T)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of dantrolene related compound B or dantrolene related compound C in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of Dantrolene Sodium in the *Test solution*;  $r_U$  is the individual peak response for dantrolene related compound B or dantrolene related compound C obtained from the *Test solution*; and  $r_S$  is the response of the corresponding peak obtained from the *Standard solution*. Not more than 0.50% of dantrolene related compound B is found; and not more than 0.30% of dantrolene related compound C is found.

#### Assay—

**Buffer**—Dissolve 3.85 g of ammonium acetate in 1.0 L of water, and adjust with glacial acetic acid to a pH of  $4.5 \pm 0.1$ .

**Diluent**—Prepare a mixture of water and acetonitrile (50:50).

**Solution A**—Prepare a filtered and degassed mixture of water, *Buffer*, and acetonitrile (70:20:10).

**Solution B**—Prepare a filtered and degassed mixture of acetonitrile and *Buffer* (80:20).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability stock solution A**—Transfer 62.5 mg of USP Dantrolene Sodium RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 1.25 mg per mL of dantrolene sodium.

**System suitability stock solution B**—Transfer 6.3 mg each of USP Dantrolene Related Compound B RS and USP Dantrolene Related Compound C RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having known concentrations of about 0.125 mg per mL each of dantrolene related compound B and dantrolene related compound C.

**System suitability solution**—Quantitatively dilute suitable volumes of *System suitability stock preparation A* and *System suitability stock preparation B* with *Diluent* to obtain a solution having concentrations of about 0.125 mg per mL of dantrolene sodium and 2.5 µg per mL each of dantrolene related compound B and dantrolene related compound C.

**Standard stock preparation**—Transfer 50 mg of USP Dantrolene RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 1.0 mg per mL of dantrolene.

**Standard preparation**—Dilute the *Standard stock preparation* with *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL of dantrolene.

**Assay stock preparation**—Transfer an accurately weighed quantity of dantrolene sodium into a 100-mL volumetric flask, and dissolve in 5 mL of dimethylformamide. Add 5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a concentration of about 1.25 mg per mL of dantrolene sodium.

**Assay preparation**—Dilute the *Assay stock preparation* with *Diluent* to obtain a solution having a concentration of about 0.125 mg per mL of dantrolene sodium.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 365-nm detector

and a 4.6-mm × 15-cm column that contains 5-µm L1 packing. The flow rate is about 2.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solvent A (%)	Solvent B (%)	Elution
0–10	90→60	10→40	linear gradient
10–20	60→10	40→90	linear gradient
20–25	10	90	isocratic
25–25.1	10→90	90→10	linear gradient
25.1–35	90	10	re-equilibration

Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between dantrolene and dantrolene related compound C is not less than 8. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.0%. [NOTE—For the purpose of identification, the approximate relative retention times are 0.68 for dantrolene related compound B, 1.24 for dantrolene related compound C, and 1.0 for dantrolene.]

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dantrolene peaks. Calculate the percentage of dantrolene ( $C_{14}H_9N_4O_5$ ) in the portion of Dantrolene Sodium taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of dantrolene in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of Dantrolene Sodium in the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses for dantrolene obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dantrolene Sodium Capsules

» Dantrolene Sodium Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dantrolene sodium ( $C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards (11)—

USP Dantrolene RS

USP Dantrolene Related Compound B RS

5-(4-Nitrophenyl)-2-furaldehyde-2-carboxymethyl semicarbazone.

$C_{14}H_{12}N_4O_6$

USP Dantrolene Sodium RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

#### Dissolution (711)—

**Medium:** 0.5% methylbenzethonium chloride in water, pH 6.8 (adjusted with 0.1 N potassium hydroxide or 0.1 N hydrochloric acid); 900 mL, deaerated.

**Apparatus 1:** 100 rpm.

**Time:** 40 minutes.

Determine the amount of  $C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$  dissolved by employing the following method.

**Standard solution 1** (for Capsules labeled to contain 100 mg)—Transfer 25 mg of USP Dantrolene RS, accurately weighed, to a 250-mL volumetric flask. Dissolve in 5.0 mL of dimethylformamide. Add 200 mL of *Medium* and 10.0 mL of 0.1 N potassium hydroxide. Mix, dilute with *Medium* to volume, and mix. Pass through a 0.45- $\mu$ m polytetrafluoroethylene (PTFE) filter, previously wetted with a few drops of isopropyl alcohol, discarding the first 5 mL.

**Standard solution 2** (for Capsules labeled to contain 50 mg)—Transfer 25.0 mL of *Standard solution 1* to a 50-mL volumetric flask containing 0.5 mL of 0.1 N potassium hydroxide. Dilute with *Medium* to volume, and mix. Pass through a 0.45- $\mu$ m PTFE filter, previously wetted with a few drops of isopropyl alcohol, discarding the first 5 mL.

**Standard solution 3** (for Capsules labeled to contain 25 mg)—Transfer 25.0 mL of *Standard solution 1* to a 100-mL volumetric flask containing 1.0 mL of 0.1 N potassium hydroxide. Dilute with *Medium* to volume, and mix. Pass through a 0.45- $\mu$ m PTFE filter, previously wetted with a few drops of isopropyl alcohol, discarding the first 5 mL.

**Test solution**—Withdraw 10 mL of the solution under test. Pass through a 0.45- $\mu$ m PTFE filter, previously wetted with a few drops of isopropyl alcohol. Discard the first 5 mL. Collect the filtered solution in a tube that contains 1 drop of 1 N potassium hydroxide, and mix.

**System suitability**—[NOTE—All absorbance values should be obtained on solutions within 2 hours of their preparation.] Using a 0.1-cm cell, measure the absorbance of the *Medium*, using water as the blank, and measure the absorbance of each of the three *Standard solutions* using *Medium* as the blank, at the wavelength of maximum absorbance at about 395 nm. The system is considered suitable for use if the following criteria are met: the absorbance of the *Medium* is less than 10% of the absorbance of *Standard solution 1*; the absorbance of *Standard solution 2* is between 0.3 and 0.5; and the ratio of the absorbance of *Standard solution 1* to that of *Standard solution 3* is  $4.00 \pm 0.10$ .

Determine the amount of  $C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$  dissolved by measuring the absorbance of the *Test solution* at the wavelength of maximum absorbance at about 395 nm in comparison with the appropriate *Standard solution*, using a 0.1-cm cell and *Medium* as the blank. All absorbance values are obtained on solutions within 2 hours of their preparation. Calculate the percentage of  $C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$  dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times 0.79186 \times LC}$$

in which  $A_U$  and  $A_S$  are the absorbances obtained from the *Test solution* and the *Standard solution*, respectively;  $C_S$  is the concentration, in mg per mL, of dantrolene in the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; 0.79186 is the correction for water of hydration and sodium contained in the dantrolene sodium monohydrate form of the drug, assuming that the bulk drug contains 15% of water and 6.84% of sodium; and  $LC$  is the Capsule label claim, in mg.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$  is dissolved in 40 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Related compounds—

*Diluent*, *Solution A*, *Solution B*, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the Assay.

**Standard solution**—Transfer 5 mg, accurately weighed, of USP Dantrolene Related Compound B RS into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume. The final concentration is about 0.1 mg per mL. Quantitatively dilute this solution with *Diluent* to obtain a

solution having a known concentration of about 0.0005 mg per mL of dantrolene related compound B.

**Test solution**—Use the Assay preparation.

**Procedure**—Inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of dantrolene related compound B in the portion of Capsules taken by the formula:

$$100(r_U/r_S)(C_S/C_T)$$

in which  $r_U$  is the individual peak response for dantrolene related compound B obtained from the *Test solution*;  $r_S$  is the response of the corresponding peak in the *Standard solution*;  $C_S$  is the concentration, in mg per mL, of dantrolene related compound B in the *Standard solution*; and  $C_T$  is the concentration, in mg per mL, of dantrolene sodium in the *Test solution*: not more than 2% of dantrolene related compound B is found.

#### Assay—

**Diluent**—Prepare a solution of acetonitrile and water (70:30).

**Buffer solution**—Dissolve 3.3 g of ammonium acetate in 1 L of water.

**Solution A**—Prepare a filtered and degassed mixture of *Buffer solution*, acetonitrile, and glacial acetic acid (120:76:7).

**Solution B**—Prepare a filtered and degassed mixture of acetonitrile and water (70:30).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B*, as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**System suitability solution**—Use the *Standard solution*, prepared as directed in the test for *Related compounds*.

**Standard preparation**—Transfer 40 mg, accurately weighed, of USP Dantrolene RS to a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume. The final concentration is about 0.8 mg per mL. Quantitatively dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.08 mg per mL of dantrolene.

**Assay preparation**—Mix the combined contents of not fewer than 20 Capsules, and transfer an accurately weighed portion, equivalent to the average weight of one Capsule, to a 50-mL volumetric flask. Add 10 mL of dimethylformamide, and sonicate for 15 minutes to dissolve. Add 5 mL of glacial acetic acid, and dilute with acetone to volume. Quantitatively dilute this solution with *Diluent* to obtain a solution having 0.1 mg per mL of dantrolene sodium, and pass through a 0.45- $\mu$ m nylon filter.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–8	100	0	isocratic
8–8.1	100→0	0→100	linear gradient
8.1–13	0	100	isocratic
13–13.1	0→100	100→0	linear gradient
13.1–20	100	0	re-equilibration

Separately inject the *System suitability solution* and the *Standard preparation* into the chromatograph, record the chromatograms, and measure the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the

relative standard deviation for replicate injections for dantrolene is not more than 1.0%. [NOTE—For the purpose of peak identification, the approximate relative retention times are 0.68 for dantrolene related compound B and 1.0 for dantrolene.]

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dantrolene peaks. Calculate the percentage of dantrolene sodium ( $C_{14}H_9N_4NaO_5 \cdot 3^{1/2}H_2O$ ) in the portion of Capsules taken by the formula:

$$100(399.29/314.25)(r_U / r_S)(C_S / C_U)$$

in which 399.29 is the molecular weight of dantrolene sodium; 314.25 is the molecular weight of dantrolene;  $r_U$  and  $r_S$  are the peak responses for dantrolene obtained from the *Assay preparation* and the *Standard preparation*, respectively;  $C_S$  is the concentration, in mg per mL, of dantrolene in the *Standard preparation*; and  $C_U$  is the concentration, in mg per mL, of dantrolene sodium ( $C_{14}H_9N_4NaO_5 \cdot 3^{1/2}H_2O$ ) in the *Assay preparation*.

## Dantrolene Sodium for Injection

» Dantrolene Sodium for Injection is a sterile, non-pyrogenic, lyophilized formulation containing Dantrolene Sodium, and one or more suitable buffering or sequestering agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{14}H_9N_4NaO_5 \cdot 3^{1/2}H_2O$ .

**Packaging and storage**—Preserve in tight containers. Store at controlled room temperature, protected from light.

### USP Reference standards (11)—

USP Dantrolene RS

USP Dantrolene Related Compound B RS

5-(4-Nitrophenyl)-2-furaldehyde-2-carboxymethyl semicarbazone.

$C_{14}H_{12}N_4O_6$

USP Endotoxin RS

### Identification—

**A:** *Infrared Absorption* (197K)—

**Test specimen**—To 0.5 g of Dantrolene Sodium for Injection, add 10 mL of 0.1 N hydrochloric acid and 10 mL of ethyl acetate, and mix. Allow the phases to separate, and transfer the upper ethyl acetate phase to a suitable glass container. Evaporate the solvent, dry the residue at 105° for 10 minutes, and use the residue.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of dantrolene sodium.

**Sterility** (71): meets the requirements.

**Uniformity of dosage units** (905): meets the requirements.

**pH** (791)—Dissolve the contents of 1 vial in 60 mL of USP Water for Injection: the pH is between 8.8 and 11.0.

**Water, Method Ia** (921): not more than 3.0%.

### Related compounds—

**Mobile phase and Diluent**—Proceed as directed in the *Assay*.

**Standard solution**—Transfer 10 mg of USP Dantrolene Related Compound B RS, accurately weighed, into a 50-mL

volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 0.2 mg per mL. Dilute with *Diluent* to obtain a solution having a known concentration of about 0.002 mg per mL of dantrolene related compound B.

**Test solution**—Use the *Assay preparation*.

**Chromatographic system**—Proceed as directed in the *Assay*. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections for dantrolene related compound B is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of dantrolene related compound B in the portion of Dantrolene Sodium for Injection taken by the formula:

$$100(r_U/r_S)(C_S/C_T)$$

in which  $r_U$  is the peak response for dantrolene related compound B obtained from the *Test solution*;  $r_S$  is the corresponding peak response in the *Standard solution*;  $C_S$  is the concentration, in mg per mL, of dantrolene related compound B in the *Standard solution*; and  $C_T$  is the concentration, in mg per mL, of dantrolene sodium hydrate in the *Test solution*. Not more than 8% of dantrolene related compound B is found.

**Other requirements:** meets the requirements under *Injections* (1).

### Assay—

**Buffer**—Dissolve 3.3 g of ammonium acetate in 1 L of water, and adjust with acetic acid to a pH of 4.5 ± 0.1.

**Solution A**—Prepare a filtered and degassed mixture of *Buffer*, acetonitrile, and glacial acetic acid (120:80:7).

**Solution B**—Prepare a filtered and degassed mixture of acetonitrile and water (70:30).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B*, as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluent**—Prepare a mixture of acetonitrile and water (60:40).

**Standard preparation**—Transfer 40 mg of USP Dantrolene RS, accurately weighed, into a 50-mL volumetric flask, and dissolve in 2.5 mL of dimethylformamide. Add 2.5 mL of glacial acetic acid, and dilute with acetone to volume to obtain a solution having a known concentration of about 0.8 mg per mL. Dilute this solution with *Diluent* to obtain a solution having a known concentration of about 0.08 mg per mL of dantrolene.

**Assay preparation**—Using 70 mL of water for each vial, transfer the entire contents of the required number of vials to a suitable flask necessary to obtain a solution having a known concentration of about 0.1 mg of dantrolene sodium hydrate per mL. Sonicate for 2 to 5 minutes to dissolve the sample. Dilute with *Diluent* to volume.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 365-nm detector and a 4.6-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–8	100	0	isocratic
8–8.1	100→0	0→100	linear gradient
8.1–13	0	100	isocratic
13–13.1	0→100	100→0	linear gradient
13.1–20	100	0	re-equilibration

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.5; and the relative standard deviation for replicate injections for dantrolene is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the peak responses for dantrolene. Calculate the percentage of  $C_{14}H_9N_4NaO_5 \cdot 3\frac{1}{2}H_2O$  in the portion of Dantrolene Sodium for Injection taken by the formula:

$$(399.29/314.25)(r_U/r_S)(C_S/C_U)$$

in which 399.29 and 314.25 are the molecular weights of dantrolene sodium hydrate and dantrolene, respectively;  $r_U$  and  $r_S$  are the peak responses for dantrolene obtained from the *Assay preparation* and the *Standard preparation*, respectively;  $C_S$  is the concentration, in mg per mL, of dantrolene in the *Standard preparation*; and  $C_U$  is the concentration, in mg per mL, of dantrolene sodium hydrate in the *Assay preparation*.

## Dapsone

$C_{12}H_{12}N_2O_2S$  248.30  
Benzenamine, 4,4'-sulfonylbis-  
4,4'-Sulfonyldianiline [80-08-0].

» Dapsone contains not less than 98.0 percent and not more than 102.0 percent of  $C_{12}H_{12}N_2O_2S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Dapsone RS

**Identification**—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 5  $\mu$ g per mL.

*Medium:* methanol.

**Melting range** (741): between 175° and 181°.

**Loss on drying** (731)—Dry it at 105° for 3 hours: it loses not more than 1.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Selenium** (291): 0.003%, a 100-mg test specimen, mixed with 100 mg of magnesium oxide, being used.

**Chromatographic purity**—

**Standard solutions**—Dissolve USP Dapsone RS in methanol and mix to obtain *Standard solution A* having a known concentration of 12.5 mg per mL. Dilute quantitatively with methanol to obtain *Standard solution B*, containing 125  $\mu$ g of the USP Reference Standard per mL, and *Standard solution C*, containing 62.5  $\mu$ g of the USP Reference Standard per mL.

**Test solution**—Dissolve an accurately weighed quantity of Dapsone in methanol to obtain a solution containing 12.5 mg per mL.

**Procedure**—[NOTE—Prepare the solvent system fresh daily. Equilibrate the chromatographic chamber with the solvent

system for 30 minutes prior to development of the chromatographic plate.] Separately apply 4  $\mu$ L of the *Test solution* and each of the *Standard solutions* to a suitable high-performance thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 150- to 200- $\mu$ m layer of chromatographic silica gel. Dry the applications with the aid of a stream of nitrogen. Position the plate in a chromatographic chamber, and develop the chromatograms in a solvent system consisting of a mixture of chloroform, acetone, *n*-butyl alcohol, and formic acid (60:15:15:10) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber and air-dry. Spray the plate lightly with a 0.1% (w/v) solution of 4-dimethylaminocinnamaldehyde in a mixture of equal volumes of glacial acetic acid and water. Examine the spots that are developed immediately, and compare the intensities of any secondary spots observed in the chromatogram of the *Test solution* with those of the principal spots in the chromatogram of the *Standard solutions*: no secondary spot from the chromatogram of the *Test solution* is larger or more intense than the principal spot obtained from *Standard solution C* (0.5%), and the sum of the intensities of all the secondary spots obtained from the *Test solution* corresponds to not more than 1.0%.

**Assay**—

**Mobile phase**—Transfer 100 mL of isopropyl alcohol, 100 mL of acetonitrile, and 100 mL of ethyl acetate to a 1000-mL volumetric flask. Add hexane to volume without mixing, then mix, and allow the mixture to cool to room temperature.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dapsone RS in *Mobile phase* to obtain a solution having a known concentration of about 250  $\mu$ g per mL. Pipet 5 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having a known concentration of about 25  $\mu$ g per mL.

**Assay preparation**—Transfer about 50 mg of Dapsone, accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 5 mL of this solution into a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains 10- $\mu$ m diameter packing L3. Chromatograph a sufficient number of injections of the *Standard preparation* as directed for *Procedure*: the relative standard deviation is not more than 2%.

**Procedure**—Separately introduce equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable microsyringe or sampling valve, adjusting the specimen size and other operating parameters to obtain satisfactory chromatograms. Measure the responses for the major peaks obtained at corresponding retention times with the *Assay preparation* and the *Standard preparation*. Calculate the quantity, in mg, of  $C_{12}H_{12}N_2O_2S$  in the portion of Dapsone taken by the formula:

$$2C(P_U / P_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Dapsone RS in the *Standard preparation*; and  $P_U$  and  $P_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Add the following:****▲Dapsone Oral Suspension****DEFINITION**

Dapsone Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of dapsone ( $C_{12}H_{12}N_2O_2S$ ). Prepare Dapsone Oral Suspension 2 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* (795)).

Dapsone tablets <sup>a</sup> equivalent to	200 mg
Vehicle: a 1:1 mixture of Ora-Sweet <sup>b</sup> and Ora-Plus <sup>b</sup> , a sufficient quantity to make	100 mL

<sup>a</sup> Dapsone 25-mg tablets, Jacobus Pharmaceutical Company, Princeton, NJ.

<sup>b</sup> Paddock Laboratories, Minneapolis, MN.

Calculate the required quantity of each ingredient for the total amount to be prepared. Place the required number of tablets in a suitable mortar, and comminute to a fine powder. Add the *Vehicle* in small portions, and triturate to make a smooth paste. Add increasing volumes of the *Vehicle* to make a dapsone liquid that is pourable. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough of the *Vehicle* to bring to final volume, and mix well.

**ASSAY****• PROCEDURE**

**Solution A:** 50 mM ammonium phosphate adjusted to a pH of 4.6

**Mobile phase:** Acetonitrile and *Solution A* (12:88). Filter and degas.

**Internal standard solution:** 1.0 mg/mL of diazoxide in methanol

**Standard stock solution:** 2.0 mg/mL of USP Dapsone RS in methanol

**Standard solution:** Pipet 2.5 mL of *Standard stock solution* into a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 50 µg/mL of dapsone and 50 µg/mL of diazoxide. Centrifuge.

**Sample solution:** Shake thoroughly by hand each bottle of Oral Suspension. Pipet 2.5 mL of Oral Suspension into a 100-mL volumetric flask, add 5.0 mL of *Internal standard solution*, and dilute with *Mobile phase* to volume to obtain a solution with a nominal concentration of 50 µg/mL of dapsone and 50 µg/mL of diazoxide. Centrifuge.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 295 nm

**Column:** 3.0-mm × 15-cm; 5-µm packing L1

**Column temperature:** 40°

**Flow rate:** 0.7 mL/min

**Injection volume:** 10 µL

**System suitability**

**Sample:** *Standard solution*

[NOTE—The retention times for dapsone and diazoxide are about 8.9 and 12.9 min, respectively.]

**Suitability requirements**

**Relative standard deviation:** NMT 2.3% for replicate injections

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dapsone ( $C_{12}H_{12}N_2O_2S$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (R_U/R_S) \times (C_S/C_U) \times 100$$

$R_U$  = peak response ratio of dapsone to the internal standard from the *Sample solution*

$R_S$  = peak response ratio of dapsone to the internal standard from the *Standard solution*

$C_S$  = concentration of dapsone in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of dapsone in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

**SPECIFIC TESTS**

**• pH (791):** 3.8–4.8

**ADDITIONAL REQUIREMENTS**

**• PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled cold temperature or at controlled room temperature.

**• LABELING:** Label it to indicate that it is to be well shaken before use, and to state the *Beyond-Use Date*.

**• BEYOND-USE DATE:** NMT 90 days after the date on which it was compounded when stored at controlled cold temperature or controlled room temperature

**• USP REFERENCE STANDARDS (11)**

USP Dapsone RS<sup>▲</sup><sub>USP36</sub>

**Dapsone Tablets****DEFINITION**

Dapsone Tablets contain NLT 92.5% and NMT 107.5% of the labeled amount of dapsone ( $C_{12}H_{12}N_2O_2S$ ).

**IDENTIFICATION**

**• A. INFRARED ABSORPTION (197K)**

**Sample solution:** Transfer a quantity of finely powdered Tablets, equivalent to 100 mg of dapsone, to a suitable container, add 5 mL of acetone, shake for 5 min, filter, and evaporate the filtrate to dryness. Dry this residue at 105° for 1 h.

**Acceptance criteria:** Meets the requirements

**• B. ULTRAVIOLET ABSORPTION (197U)**

**Sample solution:** Nominally 0.01 µg/mL prepared as follows. Triturate a quantity of finely powdered Tablets, equivalent to 100 mg of dapsone, with 50 mL of methanol, and filter. Dilute a portion of the filtrate with methanol to make approximately a 1 in 200,000 solution.

**Acceptance criteria:** Meets the requirements

**ASSAY****• PROCEDURE**

**Mobile phase:** Transfer 100 mL of isopropyl alcohol, 100 mL of acetonitrile, and 100 mL of ethyl acetate to a 1000-mL volumetric flask. Add hexane to volume without mixing, then mix, and allow the mixture to cool to room temperature.

**Standard solution:** 25 µg/mL of USP Dapsone RS in *Mobile phase*

**Sample solution:** Nominally 25 µg/mL of dapsone prepared as follows. Weigh and finely powder NLT 20 Tablets. Transfer a portion of the powder, nominally equivalent to 50 mg of dapsone, to a 200-mL volumetric flask. Add 150 mL of methanol, and place the flask in an ultrasonic bath at a temperature of 35° for 15 min, with occasional shaking. Allow to cool to room temperature, and add methanol to volume. Centrifuge a portion of the mixture until clear. Transfer 5.0 mL of the

clear supernatant to a 50-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC

Detector: UV 254 nm

Column: 4-mm × 30-cm; 10-μm diameter, packing L3

Injection volume: 10 μL

#### System suitability

Sample: *Standard solution* (chromatograph a sufficient number)

#### Suitability requirements

Relative standard deviation: NMT 2%

#### Analysis

Samples: *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of dapsone (C<sub>12</sub>H<sub>12</sub>N<sub>2</sub>O<sub>2</sub>S) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Dapsone RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of dapsone in the *Sample solution* (μg/mL)

Acceptance criteria: 92.5%–107.5%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

Medium: Dilute hydrochloric acid (2 in 100); 1000 mL

Apparatus 1: 100 rpm

Time: 60 min

Standard solution: USP Dapsone RS of a known concentration in *Medium*

Sample solution: Withdraw and filter a portion of the *Sample solution*. Transfer a portion of the filtrate estimated to contain 0.2 mg of dapsone to a 25-mL volumetric flask, add 5 mL of 1 N sodium hydroxide, and dilute with water to volume.

#### Instrumental conditions

Mode: UV

Analytical wavelength: 290 nm

Tolerances: NLT 75% (Q) of the labeled amount of dapsone (C<sub>12</sub>H<sub>12</sub>N<sub>2</sub>O<sub>2</sub>S) is dissolved.

#### • UNIFORMITY OF DOSAGE UNITS <905>

Procedure for content uniformity

Standard solution: 8 μg/mL of USP Dapsone RS in methanol

Sample solution: Nominally 8 μg/mL of dapsone prepared as follows. To 1 Tablet in a 100-mL volumetric flask add 2.0 mL of water, and allow to stand for 30 min, swirling occasionally. Add 70 mL of methanol, and place the flask in an ultrasonic bath until the specimen is completely dispersed. Add methanol to volume, and centrifuge a portion of the mixture. Quantitatively dilute a measured volume of the clear supernatant with methanol.

#### Instrumental conditions

Mode: UV

Analytical wavelength: 296 nm

Cell: 1 cm

Blank: Methanol

#### Analysis

Samples: *Standard solution* and *Sample solution*.

Calculate the percentage of the labeled amount of dapsone (C<sub>12</sub>H<sub>12</sub>N<sub>2</sub>O<sub>2</sub>S) in the Tablet taken:

$$\text{Result} = (A_U/A_S) \times (C_S/C_U) \times 100$$

$A_U$  = absorbance of the *Sample solution*

$A_S$  = absorbance of the *Standard solution*

$C_S$  = concentration of USP Dapsone RS in the *Standard solution* (μg/mL)

$C_U$  = nominal concentration of dapsone in the *Sample solution* (μg/mL)

Acceptance criteria: Meet the requirements

### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in well-closed, light-resistant containers.

• **USP REFERENCE STANDARDS <11>**

USP Dapsone RS

## Daunorubicin Hydrochloride

C<sub>27</sub>H<sub>29</sub>NO<sub>10</sub> · HCl 563.98

5,12-Naphthacenedione, 8-acetyl-10-[(3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranosyl)oxy]-7,8,9,10-tetrahydro-6,8,11-trihydroxy-1-methoxy-, (8*S*-*cis*-), hydrochloride.

(1*S*,3*S*)-3-Acetyl-1,2,3,4,6,11-hexahydro-3,5,12-trihydroxy-10-methoxy-6,11-dioxo-1-naphthacenyl 3-amino-2,3,6-trideoxy-α-L-lyxo-hexopyranoside hydrochloride [23541-50-6].

» Daunorubicin Hydrochloride has a potency equivalent to not less than 842 μg and not more than 1030 μg of C<sub>27</sub>H<sub>29</sub>NO<sub>10</sub> per mg.

*Caution—Great care should be taken to prevent inhaling particles of Daunorubicin Hydrochloride and exposing the skin to it.*

**Packaging and storage**—Preserve in tight containers, protected from light and excessive heat.

**USP Reference standards <11>**—USP Daunorubicin Hydrochloride RS

#### Identification—

**A:** The IR absorption spectrum of a potassium bromide dispersion of it exhibits maxima only at the same wavelengths as that of a similar preparation of USP Daunorubicin Hydrochloride RS.

**B:** The retention time of the main peak obtained with the *Assay preparation* corresponds to that obtained with the *Standard preparation* as directed in the *Assay*.

**Crystallinity <695>**: meets the requirements.

**pH <791>**: between 4.5 and 6.5, in a solution containing 5 mg per mL.

**Water, Method I <921>**: not more than 3.0%.

#### Assay—

*Mobile phase*—Mix 62 volumes of water and 38 volumes of acetonitrile, and adjust with phosphoric acid to a pH of 2.2 ± 0.2. The acetonitrile concentration may be varied to meet system suitability requirements and to provide a suitable elution time for daunorubicin. Filter the solution through a membrane filter (1 μm or finer porosity), and degas.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Daunorubicin Hydrochloride RS in *Mobile phase* to obtain a solution having a known concentration of about 250 μg of daunorubicin per mL.

**Resolution solution**—Prepare a solution of doxorubicin hydrochloride in the *Standard preparation* containing about 250 µg per mL.

**Assay preparation**—Transfer about 25 mg of Daunorubicin Hydrochloride, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The chromatograph is equipped with a 254-nm detector and a 4.6-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.7 for doxorubicin and 1.0 for daunorubicin; and the resolution,  $R$ , between the doxorubicin peak and the daunorubicin peak is not less than 3. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 5 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the potency, in µg of  $C_{27}H_{29}NO_{10}$  per mg, taken by the formula:

$$100(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in µg per mL, of daunorubicin in the *Standard preparation*;  $W$  is the weight, in mg, of Daunorubicin Hydrochloride taken; and  $r_U$  and  $r_S$  are the daunorubicin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Daunorubicin Hydrochloride for Injection

» Daunorubicin Hydrochloride for Injection is a sterile mixture of Daunorubicin Hydrochloride and Mannitol. It contains the equivalent of not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{27}H_{29}NO_{10}$ .

**Packaging and storage**—Preserve in light-resistant Containers for Sterile Solids as described under *Injections* <1>.

**USP Reference standards** <11>—  
USP Daunorubicin Hydrochloride RS  
USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.

**Identification**—The retention time of the main peak obtained with the *Assay preparation* corresponds to that obtained with the *Standard preparation* as directed in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 4.3 USP Endotoxin Units per mg of daunorubicin.

**pH** <791>: between 4.5 and 6.5, in the solution constituted as directed in the labeling.

**Water, Method I** <921>: not more than 3.0%, the *Test Preparation* being prepared as directed for a hygroscopic specimen.

**Other requirements**—It meets the requirements under *Injections* <1>.

### Assay—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Daunorubicin Hydrochloride*.

**Assay preparation**—Transfer the contents of 1 vial of Daunorubicin Hydrochloride for Injection with the aid of *Mobile phase* to an appropriate volumetric flask, and dilute with *Mobile phase* to volume to obtain a solution containing about 0.25 mg of daunorubicin per mL.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Daunorubicin Hydrochloride*. Calculate the quantity, in mg, of  $C_{27}H_{29}NO_{10}$  in the vial of Daunorubicin Hydrochloride for Injection taken by the formula:

$$(CV/1000)(r_U/r_S)$$

in which  $V$  is the volume, in mL, of the *Assay preparation*, and the other terms are as defined therein.

## Decoquinatate

$C_{24}H_{35}NO_5$  417.54

3-Quinolinecarboxylic acid, 6-(decyloxy)-7-ethoxy-4-hydroxy-, ethyl ester.

Ethyl 6-(decyloxy)-7-ethoxy-4-hydroxy-3-quinolinecarboxylate [18507-89-6].

» Decoquinatate contains not less than 99.0 percent and not more than 101.0 percent of  $C_{24}H_{35}NO_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** <11>—

USP Decoquinatate RS

### Identification—

**A: Infrared Absorption** <197K>.

**B:** Transfer about 40 mg of it, accurately weighed, to a 100-mL volumetric flask, add 10 mL of hot chloroform, swirl to dissolve, and while still warm add about 60 mL of dehydrated alcohol. Allow to cool, dilute with dehydrated alcohol to volume, and mix. Promptly transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with dehydrated alcohol to volume, and mix. Transfer 10.0 mL of this solution to a third 100-mL volumetric flask, add 10 mL of 0.1 N hydrochloric acid, dilute with dehydrated alcohol to volume, and mix: the UV absorption spectrum of this solution exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Decoquinatate RS, concurrently measured, and the respective absorptivities, calculated on the dried basis, at the wavelength of maximum absorption at about 265 nm do not differ by more than 2.5%.

**Loss on drying** <731>—Dry it at 105° to constant weight: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.1%.

### Ordinary impurities <466>—

**Test solution:** chloroform, prepared with the aid of heat.

**Standard solution:** chloroform, using dilutions of the *Test solution*.

**Eluant:** a mixture of chloroform, dehydrated alcohol, and anhydrous formic acid (85:10:5).

**Visualization:** 1.

**Tolerances:** no impurity exceeds 1%, and the total does not exceed 2%.

**Assay**—Dissolve about 1000 mg of Decoquinatate, accurately weighed, in 100 mL of glacial acetic acid, with the aid of gentle heat. Allow to cool, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 41.76 mg of  $C_{24}H_{35}NO_5$ .

## Decoquinatate Premix

» Decoquinatate Premix contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{24}H_{35}NO_5$ , the labeled amount being between 1 g and 10 g per 100 g of Premix.

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label it to indicate that it is for veterinary use only.

### USP Reference standards (11)—

USP Decoquinatate RS

**Identification**—To an accurately weighed quantity of it, equivalent to about 100 mg of decoquinatate, add 40 mL of chloroform, and heat under a reflux condenser on a water bath for 20 minutes, cool, and filter. Use the filtrate as the test solution. Apply 10- $\mu$ L portions of the test solution and of a Standard solution in chloroform containing 2.5 mg of USP Decoquinatate RS per mL to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and alcohol (70:30) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, and allow to dry in a current of air. Locate the spots under short-wave-length UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Assay**—Extract an accurately weighed quantity of Premix, equivalent to about 200 mg of decoquinatate, with 50 mL of chloroform in a small continuous extraction apparatus for 8 reflux cycles. Transfer the extract to a 100-mL volumetric flask with the aid of chloroform, cool, dilute with chloroform to volume, and mix. Transfer 5.0 mL of this solution to a second 100-mL volumetric flask, dilute with dehydrated alcohol to volume, and mix. Transfer 5.0 mL of this solution to a third 100-mL volumetric flask, add 10 mL of 0.1 N hydrochloric acid, dilute with dehydrated alcohol to volume, and mix (*Assay preparation*). Transfer 50 mg of USP Decoquinatate RS, accurately weighed, to a 100-mL volumetric flask, add 10 mL of hot chloroform, swirl to dissolve, and while still warm slowly add 70 mL of dehydrated alcohol. Allow to cool, dilute with dehydrated alcohol to volume, and mix. Immediately transfer 10.0 mL of this solution to a second 100-mL volumetric flask, dilute with dehydrated alcohol to volume, and mix. Transfer 10.0 mL of this solution to a third 100-mL volumetric flask, add 10 mL of 0.1 N hydrochloric acid, dilute with dehydrated alcohol to volume, and mix. This *Standard preparation* contains about 0.005 mg of USP Decoquinatate RS per mL. Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* at the wavelength of maximum absorbance at about 265 nm, with a spectrophotometer, using a mixture

of dehydrated alcohol, 0.1 N hydrochloric acid, and chloroform (90:10:0.25) as the blank. Calculate the percentage of  $C_{24}H_{35}NO_5$  in the portion of Premix taken by the formula:

$$4000(C/W)(A_U/A_S)$$

in which C is the concentration, in mg per mL, of USP Decoquinatate RS in the *Standard preparation*; W is the quantity, in g, of Premix taken to prepare the *Assay preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Deferoxamine Mesylate

$C_{25}H_{48}N_6O_8 \cdot CH_4O_3S$  656.79  
Butanediamide, *N'*-[5-[[4-[[5-(acetylhydroxyamino)pentyl]-amino]-1,4-dioxobutyl]hydroxyamino]pentyl]-*N*-(5-aminopentyl)-*N*-hydroxy-, monomethanesulfonate;  
*N*-[5-[3-[(5-Aminopentyl)hydroxycarbonyl]propionamido]pentyl]-3-[[5-(*N*-hydroxyacetamido)pentyl]carbonyl]propionohydroxamic acid monomethanesulfonate (salt) [138-14-7].

### DEFINITION

Deferoxamine Mesylate contains NLT 93.0% and NMT 102.0% of  $C_{25}H_{48}N_6O_8 \cdot CH_4O_3S$ , calculated on the anhydrous basis.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)
- **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

### ASSAY

#### • PROCEDURE

**Solution A:** 1.32 g/L of dibasic ammonium phosphate in water. Adjust with phosphoric acid to a pH of 3.0.

**Solution B:** Acetonitrile and *Solution A* (1:1)

**Mobile phase:** See Table 1.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	88	12
20	80	20
35	57.5	42.5
35.1	88	12
40	88	12

**Diluent:** Acetonitrile and water (6:94)

**Standard solution:** 1.0 mg/mL of USP Deferoxamine Mesylate RS in *Diluent*

**Sample solution:** 1.0 mg/mL of Deferoxamine Mesylate in *Diluent*

**Chromatographic system**(See *Chromatography* <621>, *System Suitability*.)**Mode:** LC**Detector:** UV 220 nm**Column:** 4.6-mm × 7.5-cm; 3.5-μm packing L1**Column temperature:** 32°**Autosampler temperature:** 5°**Flow rate:** 1.5 mL/min**Injection size:** 20 μL**System suitability****Sample:** *Standard solution***Suitability requirements****Relative standard deviation:** NMT 2.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of deferoxamine mesylate

(C<sub>25</sub>H<sub>48</sub>N<sub>6</sub>O<sub>8</sub> · CH<sub>3</sub>O<sub>3</sub>S) in the portion of Deferoxamine

Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of deferoxamine from the *Sample solution* $r_S$  = peak response of deferoxamine from the *Standard solution* $C_S$  = concentration of the *Standard solution* (mg/mL) $C_U$  = concentration of the *Sample solution* (mg/mL)**Acceptance criteria:** 93.0%–102.0% on the anhydrous basis**IMPURITIES**

- **RESIDUE ON IGNITION** <281>: NMT 0.1%, 2.0 g being used

- **ORGANIC IMPURITIES**

**Solution A, Solution B, Diluent, Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.**Standard stock solution:** Use the *Standard solution*, prepared as directed in the *Assay*. [NOTE—USP Deferoxamine Mesylate RS contains impurity A as a minor component.]**Standard solution:** 0.01 mg/mL of USP Deferoxamine Mesylate RS in *Diluent* from the *Standard stock solution***System suitability****Samples:** *Standard stock solution* and *Standard solution***Suitability requirements****Resolution:** NLT 2.0 between the impurity A and deferoxamine peaks, *Standard stock solution***Relative standard deviation:** NMT 5.0% for the deferoxamine peak, *Standard solution***Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of each impurity in the portion of Deferoxamine Mesylate taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response of each impurity from the *Sample solution* $r_S$  = peak response of deferoxamine from the *Standard solution* $C_S$  = concentration of the *Standard solution* (mg/mL) $C_U$  = concentration of the *Sample solution* (mg/mL)**Acceptance criteria:** See *Table 2*.

[NOTE—The reporting level for impurities is 0.04%.]

**Table 2**

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Impurity A*	0.85	3.0
Deferoxamine	1.0	—
Any unspecified impurity	—	1.0
Total impurities eluting before deferoxamine	—	5.0
Total impurities eluting after deferoxamine	—	2.0

\* Des-methylene impurity (desferrioxamine A).

**SPECIFIC TESTS**

- **PH** <791>: 4.0–6.0, in a solution (1 in 100)
- **WATER DETERMINATION, Method I** <921>: NMT 2.0%
- **STERILITY TESTS** <71>: Where the label states that Deferoxamine Mesylate is sterile, it meets the requirements.
- **BACTERIAL ENDOTOXINS TEST** <85>: Where the label states that Deferoxamine Mesylate is sterile or must be subjected to further processing during the preparation of injectable dosage forms, it contains NMT 0.33 USP Endotoxin Unit/mg of deferoxamine mesylate.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight containers. Store in a cold place.
- **LABELING:** Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.
- **USP REFERENCE STANDARDS** <11>  
USP Deferoxamine Mesylate RS  
USP Endotoxin RS

**Deferoxamine Mesylate for Injection**

» Deferoxamine Mesylate for Injection contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>25</sub>H<sub>48</sub>N<sub>6</sub>O<sub>8</sub> · CH<sub>3</sub>O<sub>3</sub>S.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.**USP Reference standards** <11>—

USP Deferoxamine Mesylate RS

USP Endotoxin RS

**Constituted solution**—At the time of use, it meets the requirements for *Constituted Solutions* under *Injections* <1>.**Identification**—Dissolve 5 mg in 5 mL of water, add 2 mL of tribasic sodium phosphate solution (1 in 200), mix, then add 10 drops of β-naphthoquinone-4-sodium sulfonate solution (1 in 40); a blackish brown color is produced.**Bacterial endotoxins** <85>—It contains not more than 0.33 USP Endotoxin Unit per mg of deferoxamine mesylate.**PH** <791>: between 4.0 and 6.0, in a solution (1 in 100).**Water, Method I** <921>: not more than 1.5%.**Other requirements**—It meets the requirements under *Injections* <1> and *Uniformity of Dosage Units* <905>.**Assay**—*Ferric chloride solution*—Dissolve 6.7 g of ferric chloride in dilute hydrochloric acid (1 in 100) in a 100-mL volumetric

flask. Add dilute hydrochloric acid (1 in 100) to volume, mix, and filter.

**Standard preparation**—Dissolve a suitable quantity of USP Deferoxamine Mesylate RS, accurately weighed, in water to obtain a solution having a known concentration of about 1000 µg per mL.

**Assay preparation**—Constitute the contents of 1 vial in water, and dilute quantitatively, and stepwise if necessary, with water to obtain a solution having a concentration of about 1 mg per mL.

**Procedure**—Pipet 2 mL each of the *Standard preparation*, *Assay preparation*, and water to provide a blank, into separate 25-mL volumetric flasks. To each flask add 3 mL of *Ferric chloride solution*, dilute with water to volume, and mix. Concomitantly determine the absorbances of the solutions from the *Standard preparation* and the *Assay preparation* against the blank, in 1-cm cells, at the wavelength of maximum absorbance at about 485 nm, with a suitable spectrophotometer. Calculate the quantity, in mg, of deferoxamine mesylate ( $C_{25}H_{48}N_6O_8 \cdot CH_4O_3S$ ) in the vial of Deferoxamine Mesylate for Injection taken by the formula:

$$CV(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Deferoxamine Mesylate RS in the *Standard preparation*; V is the volume, in mL, of water used to prepare the *Assay preparation*; and  $A_U$  and  $A_S$  are the absorbances of the solutions obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dehydrocholic Acid

$C_{24}H_{34}O_5$  402.52  
Cholan-24-oic acid, 3,7,12-trioxo-, (5β)-;  
3,7,12-Trioxo-5β-cholan-24-oic acid [81-23-2].

### DEFINITION

Dehydrocholic Acid contains NLT 98.5% and NMT 101.0% of  $C_{24}H_{34}O_5$ , calculated on the dried basis. Dehydrocholic Acid for parenteral use melts between 237° and 242°.

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

### ASSAY

#### • PROCEDURE

**Sample solution:** Transfer 500 mg of Dehydrocholic Acid to a 300-mL conical flask, add 60 mL of neutralized alcohol, and warm on a steam bath until dissolved. Allow to cool.

**Analysis:** Add phenolphthalein TS and 20 mL of water to the *Sample solution*. Titrate with 0.1 N sodium hydroxide VS, adding 100 mL of water shortly before the endpoint is reached. Each mL of 0.1 N sodium hydroxide is equivalent to 40.25 mg of  $C_{24}H_{34}O_5$ .

**Acceptance criteria:** 98.5%–101.0% on the dried basis

### IMPURITIES

- **RESIDUE ON IGNITION** (281): NMT 0.3%

#### • BARIUM

**Sample:** 2 g

**Analysis:** Boil the *Sample* with 100 mL of water for 2 min. Add 2 mL of hydrochloric acid, and again boil for

2 min. Cool, filter, and wash the filter with water until the filtrate measures 100 mL. To 10 mL of the filtrate add 1 mL of 2 N sulfuric acid.

**Acceptance criteria:** No turbidity is produced.

- **HEAVY METALS**, *Method II* (231): 20 ppm

### SPECIFIC TESTS

- **MELTING RANGE OR TEMPERATURE** (741): 231°–242°, but the range between beginning and end of melting does not exceed 3°.
- **OPTICAL ROTATION**, *Specific Rotation* (781S): +29.0° to +32.5°  
**Sample solution:** 20 mg/mL in dioxane
- **LOSS ON DRYING** (731): Dry at 105° for 2 h: it loses NMT 1.0% of its weight.
- **MICROBIAL ENUMERATION TESTS** (61) and **TESTS FOR SPECIFIED MICROORGANISMS** (62): It meets the requirements of the test for absence of *Salmonella* species.
- **ODOR ON BOILING:** Boil 2 g with 100 mL of water for 2 min: the mixture is odorless.

### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** (11)  
USP Dehydrocholic Acid RS

## Dehydrocholic Acid Tablets

### DEFINITION

Dehydrocholic Acid Tablets contain NLT 94.0% and NMT 106.0% of the labeled amount of  $C_{24}H_{34}O_5$ .

### IDENTIFICATION

- **A. INFRARED ABSORPTION** (197K)

**Sample:** Mix a quantity of finely powdered Tablets equivalent to 500 mg of dehydrocholic acid with 15 mL of water, and add slowly, with stirring, 2 mL of sodium carbonate TS. Filter, and add to the filtrate 3 N hydrochloric acid (about 2 mL) dropwise until no more precipitate is formed. Filter the precipitate, wash with small portions of cold water until free from chloride, and dry at 105° for 2 h. [NOTE—Reserve a portion of the material obtained for use in *Identification* test B.]

- **B. MELTING RANGE OR TEMPERATURE** (741): 231°–242°, but the range between beginning and end of melting does not exceed 3°.

**Sample:** Use the material reserved from *Identification* test A.

### ASSAY

#### • PROCEDURE

**Sample:** Finely powder NLT 20 Tablets. Transfer a portion of the powder equivalent to 500 mg of dehydrocholic acid to a 300-mL conical flask. Add 60 mL of neutralized alcohol, and warm on a steam bath for 10 min. Allow to cool.

**Analysis:** Add phenolphthalein TS and 20 mL of water. Titrate with 0.1 N sodium hydroxide VS, adding 100 mL of water shortly before the endpoint is reached. Each mL of 0.1 N sodium hydroxide is equivalent to 40.25 mg of  $C_{24}H_{34}O_5$ .

**Acceptance criteria:** 94.0%–106.0%

### PERFORMANCE TESTS

- **DISINTEGRATION** (701)  
Time: NMT 30 min
- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**SPECIFIC TESTS**

- **MICROBIAL ENUMERATION TESTS** <61> and **TESTS FOR SPECIFIED MICROORGANISMS** <62>: Meets the requirements of the test for absence of *Salmonella* species

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **USP REFERENCE STANDARDS** <11>  
USP Dehydrocholic Acid RS

**Demecarium Bromide**

$C_{32}H_{52}Br_2N_4O_4$  716.59

Benzenaminium, 3,3'-[1,10-decanediylbis[(methylimino)carbonyloxy]]bis[*N,N,N*-trimethyl]-, dibromide.

(*m*-Hydroxyphenyl)trimethylammonium bromide decamethylenebis[methylcarbamate] (2:1) [56-94-0].

» Demecarium Bromide contains not less than 95.0 percent and not more than 100.5 percent of  $C_{32}H_{52}Br_2N_4O_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Demecarium Bromide RS

**Identification—**

**A:** *Infrared Absorption* <197K>.

**B:** Dissolve about 100 mg in 50 mL of 1 N sodium hydroxide, and reflux for 15 minutes. Cool, and add 3 mL of the refluxed solution to 25 mL of saturated sodium bicarbonate solution. Add, with mixing, 4 mL of *N,N*-dimethyl-*p*-phenylenediamine dihydrochloride solution (1.5 in 10,000) and 2 mL of sodium hypochlorite solution (1.5 in 20,000): a violet-blue color is produced.

**C:** Dissolve about 50 mg in 20 mL of water, add 10 mL of a 1 in 50 solution of ammonium reineckate in methanol, and allow to stand for 30 minutes with occasional swirling: a pink reineckate of demecarium forms, and it melts between 131° and 136°, with decomposition.

**D:** A solution of it responds to the tests for *Bromide* <191>.

**pH** <791>: between 5.0 and 7.0, in a solution (1 in 100).

**Water, Method I** <921>: not more than 2.0%.

**Residue on ignition** <281>: not more than 0.1%.

**Heavy metals, Method I** <231>: 0.002%.

**Limit of *m*-trimethylammonio-phenol bromide—**

**Control solution**—Dissolve 100 mg of *m*-dimethylaminophenol in 10 mL of alcohol in a 1000-mL volumetric flask, dilute with water to volume, and mix. Pipet 1 mL of this solution into a 500-mL volumetric flask, dilute with water to volume, and mix.

**Test solution**—Transfer 100 mg of Demecarium Bromide to a 100-mL volumetric flask, add water to volume, and mix.

**Procedure**—Pipet 25 mL of the *Test solution* into a glass-stoppered, 50-mL centrifuge tube, and pipet 25 mL of the

*Control solution* into a second, similar tube. To each tube add 3 mL of pH 7.0 phosphate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*), 1 mL of *N,N*-dimethyl-*p*-phenylenediamine dihydrochloride solution (1.5 in 10,000), 5 mL of isobutyl alcohol, and 1 mL of sodium hypochlorite solution (1.5 in 20,000). Insert the stoppers in the tubes, shake the mixtures for 5 minutes, and centrifuge: any blue color produced in the upper layer obtained from the *Test solution* is not more intense than that obtained from the *Control solution*.

**Assay**—Dissolve about 0.8 g of Demecarium Bromide, accurately weighed, in a mixture of 75 mL of glacial acetic acid and 15 mL of mercuric acetate TS, warming slightly, if necessary, to effect solution. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 35.83 mg of  $C_{32}H_{52}Br_2N_4O_4$ .

**Demecarium Bromide Ophthalmic Solution**

» Demecarium Bromide Ophthalmic Solution is a sterile, aqueous solution of Demecarium Bromide. It contains not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $C_{32}H_{52}Br_2N_4O_4$ . It contains a suitable antimicrobial agent.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Demecarium Bromide RS

**Identification—**

**A:** Mix about 10 mL with 12.5 mL of 1 N sodium hydroxide, and proceed as directed in *Identification test B* under *Demecarium Bromide*, beginning with "reflux for 15 minutes": a violet-blue color is produced.

**B:** To 10 mL add 5 mL of a 1 in 50 solution of ammonium reineckate in methanol, and allow to stand for 30 minutes with occasional swirling: a pink reineckate of demecarium forms, and it melts between 131° and 136°, with decomposition.

**C:** It responds to the tests for *Bromide* <191>.

**Sterility** <71>: meets the requirements.

**Assay**—Into each of two 50-mL volumetric flasks marked 1 and 2 pipet a volume of Ophthalmic Solution, equivalent to about 2.5 mg of demecarium bromide. Into each of two additional 50-mL volumetric flasks, marked 3 and 4, pipet 5.0 mL of a freshly prepared Standard solution made by dissolving about 50 mg of USP Demecarium Bromide RS, accurately weighed, in 100.0 mL of water. To flasks 1 and 3, add 1 N sodium hydroxide to volume, and mix. Transfer 10.0 mL of each of these solutions to separate glass-stoppered tubes, insert the stoppers loosely, heat the tubes in a water bath for 15 minutes, then cool to room temperature. The concentration of USP Demecarium Bromide RS in the Standard solution is about 50 µg per mL. To flasks 2 and 4, add pH 10.0 alkaline borate buffer (see under *Solutions* in the section *Reagents, Indicators, and Solutions*) to volume, and mix. Concomitantly determine the absorbances of the two sodium hydroxide solutions at the wavelength of maximum absorbance at about 292 nm, with a suitable spectrophotometer, using the corresponding borate buffer solutions as the respective solvent blanks. Calculate the quantity, in mg,

of  $C_{32}H_{52}Br_2N_4O_4$  in each mL of the Ophthalmic Solution taken by the formula:

$$(50C / V)(A_U / A_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Demecarium Bromide RS in the Standard solution;  $V$  is the volume, in mL, of Ophthalmic Solution taken; and  $A_U$  and  $A_S$  are the absorbances of the sodium hydroxide solution from the Ophthalmic Solution and the Standard solution, respectively.

## Demeclocycline

$C_{21}H_{21}ClN_2O_8$  464.85

2-Naphthacenecarboxamide, 7-chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-, [4S-(4 $\alpha$ ,4a $\alpha$ ,5a $\alpha$ ,6 $\beta$ ,12a $\alpha$ )]-. 7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-2-naphthacenecarboxamide [127-33-3].

Sesquihydrate 491.88 [13215-10-6].

» Demeclocycline has a potency equivalent to not less than 970  $\mu$ g of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ) per mg, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Demeclocycline Hydrochloride RS

### Identification—

**A:** Transfer about 40 mg, accurately weighed, to a 250-mL volumetric flask, add 2 mL of 0.1 N hydrochloric acid to dissolve, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add about 75 mL of water and 5.0 mL of 5 N sodium hydroxide, dilute with water to volume, and mix: the UV absorption spectrum of this solution, measured at 6 minutes, accurately timed, after the addition of the sodium hydroxide, exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Demeclocycline Hydrochloride RS, concomitantly measured, and the absorptivity, calculated on the anhydrous basis, at the wavelength of maximum absorbance at about 380 nm is between 103.5% and 111.3% of that of the USP Demeclocycline Hydrochloride RS, the potency of the Reference Standard being taken into account.

**B:** Transfer 40 mg, accurately weighed, to a 200-mL volumetric flask, add 100 mL of 0.1 N hydrochloric acid, shake to dissolve, dilute with 0.1 N hydrochloric acid to volume, and mix. Transfer 5.0 mL of this solution into each of two 50-mL volumetric flasks (*Solutions 1* and *2*). Prepare similar solutions of USP Demeclocycline Hydrochloride RS (*Solutions 3* and *4*). To *Solutions 1* and *3*, add 10 mL of 6 N hydrochloric acid, and to *Solutions 2* and *4*, add 10 mL of 3 N hydrochloric acid. Heat the four flasks in a water bath for 20 minutes, cool, dilute the contents with water to volume, and mix. Determine the absorbances of *Solutions 1* and *3* at the wavelength of maximum absorbance at about 430 nm, with a suitable spectrophotometer, using *Solutions 2* and *4*, respectively, as the blanks. Determine the absorbances of

ance at about 368 nm, using *Solutions 1* and *3*, respectively, as the blanks. Calculate the ratio:

$$(W_S P / 1000)(A_{368} + A_{430})_U / W_U(A_{368} + A_{430})_S$$

in which  $W_S$  is the weight, in mg, of USP Demeclocycline Hydrochloride RS taken, calculated on the dried basis;  $P$  is the potency, in  $\mu$ g per mg, of the USP Demeclocycline Hydrochloride RS;  $W_U$  is the weight, in mg, of specimen taken, calculated on the anhydrous basis; and the final two parenthetic expressions are the absorbances of the four solutions at the wavelengths indicated by the subscripts for the specimen ( $U$ ) and the Standard ( $S$ ): the ratio is between 0.97 and 1.17.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 4.0 and 5.5, in a solution containing 10 mg per mL.

**Water, Method I** (921): between 4.3% and 6.7%.

### Assay—

**Mobile phase**—Transfer 80 g of tertiary butyl alcohol to a 1000-mL volumetric flask with the aid of 200 mL of water, add 100 mL of 0.2 M pH 9.0 phosphate buffer (prepared by mixing appropriate volumes of 0.2 M dibasic potassium phosphate and 0.2 M monobasic potassium phosphate), 150 mL of 0.02 M tetrabutylammonium hydrogen sulfate (adjusted with sodium hydroxide TS to a pH of 9.0), and 100 mL of 0.01 M edetate disodium (adjusted with sodium hydroxide TS to a pH of 9.0). Dilute with water to volume, mix, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Decreasing the amount of tertiary butyl alcohol increases the resolution.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Demeclocycline Hydrochloride RS in 0.01 N hydrochloric acid to obtain a solution having a known concentration of about 1 mg per mL.

**Assay preparation**—Transfer about 45 mg of Demeclocycline, accurately weighed, to a 50-mL volumetric flask, dissolve in 0.01 N hydrochloric acid, dilute with 0.01 N hydrochloric acid to volume, and mix.

**Resolution solution**—Prepare a solution of USP Demeclocycline Hydrochloride RS in 0.01 N hydrochloric acid, and allow to stand for 3 hours.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column containing packing L21 and maintained at  $60 \pm 0.5^\circ$ . The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed for *Procedure*: the relative retention times are about 0.7 for epidemethylchlortetracycline and 1.0 for demeclocycline; and the resolution between the epidemethylchlortetracycline peak and the demeclocycline peak is not less than 3.0. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in  $\mu$ g, of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ) equivalent in each mg of the Demeclocycline taken by the formula:

$$50(CE / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Demeclocycline Hydrochloride RS in the *Standard preparation*;  $E$  is the demeclocycline hydrochloride equivalent, in  $\mu$ g per mg, of USP Demeclocycline Hydrochloride RS;  $W$  is the quantity, in mg, of the Demeclocycline taken; and  $r_U$  and  $r_S$  are the demeclocycline peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Demeclocycline Oral Suspension

» Demeclocycline Oral Suspension contains the equivalent of not less than 90.0 percent and not more than 125.0 percent of the labeled amount of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ). It may contain one or more suitable buffers, preservatives, stabilizers, and suspending agents.

**Packaging and storage**—Preserve in tight containers, protected from light.

**USP Reference standards** (11)—

USP Demeclocycline Hydrochloride RS

**Identification**—To an accurately measured volume of Oral Suspension, equivalent to about 50 mg of demeclocycline hydrochloride, add 50 mL of methanol, shake, and allow the mixture to settle. Using the clear supernatant as the *Test Solution*, proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

**Uniformity of dosage units** (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**pH** (791): between 4.0 and 5.8.

**Assay**—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Demeclocycline*.

*Assay preparation*—Transfer an accurately weighed quantity of Oral Suspension, freshly mixed and free from air bubbles, equivalent to about 50 mg of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ), to a 50-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Sonicate for 5 minutes, and centrifuge for 5 minutes. Pass a portion of the supernatant through a suitable filter having a 1.5- $\mu$ m or finer porosity, and use the clear filtrate as the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Demeclocycline*. Calculate the quantity, in mg, of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ) equivalent in each mL of Oral Suspension taken by the formula:

$$0.05(CE / V)(r_U / r_S)$$

in which *V* is the volume, in mL, of Oral Suspension taken; and the other terms are as defined therein.

## Demeclocycline Hydrochloride

$C_{21}H_{21}ClN_2O_8 \cdot HCl$  501.31

2-Naphthacenecarboxamide, 7-chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-, monohydrochloride, 4S-(4 $\alpha$ , 4a $\alpha$ , 5a $\alpha$ , 6 $\beta$ , 12a $\alpha$ )-.

7-Chloro-4-(dimethylamino)-1,4,4a,5,5a,6,11,12a-octahydro-3,6,10,12,12a-pentahydroxy-1,11-dioxo-2-naphthacenecarboxamide monohydrochloride [64-73-3].

» Demeclocycline Hydrochloride has a potency of not less than 900  $\mu$ g of  $C_{21}H_{21}ClN_2O_8 \cdot HCl$  per mg, calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Demeclocycline Hydrochloride RS

**Identification**—

**A:** It responds to *Identification* test *A* under *Demeclocycline*, except that its absorptivity, calculated on the dried basis, is between 95.8% and 104.2% of that of the USP Demeclocycline Hydrochloride RS, the potency of the Reference Standard being taken into account.

**B:** It responds to *Identification* test *B* under *Demeclocycline*, except that the ratio is 0.9 to 1.1.

**Crystallinity** (695): meets the requirements.

**pH** (791): between 2.0 and 3.0, in a solution containing 10 mg per mL.

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 2.0% of its weight.

**Assay**—

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay* under *Demeclocycline*.

*Assay preparation*—Transfer about 50 mg of Demeclocycline Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in 0.01 N hydrochloric acid, dilute with 0.01 N hydrochloric acid to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Demeclocycline*. Calculate the quantity, in  $\mu$ g, of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ) in each mg of the Demeclocycline Hydrochloride taken by the formula:

$$50(CE / W)(r_U / r_S)$$

in which *W* is the quantity, in mg, of the Demeclocycline Hydrochloride taken, and the other terms are as defined therein.

## Demeclocycline Hydrochloride Capsules

» Demeclocycline Hydrochloride Capsules contain not less than 90.0 percent and not more than 125.0 percent of the labeled amount of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Demeclocycline Hydrochloride RS

**Identification**—Shake a suitable quantity of Capsule contents with methanol to obtain a solution containing about 1 mg of demeclocycline hydrochloride per mL, and filter. Using the filtrate as the *Test Solution*, proceed as directed for *Method II* under *Identification*—*Tetracyclines* (193).

**Dissolution** (711)—

*Medium:* water; 900 mL.

*Apparatus 2:* 75 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_{21}H_{21}ClN_2O_8$  dissolved from UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Demeclocycline Hydrochloride RS in the same *Medium*.

**Tolerances**—Not less than 75% (Q) of the labeled amount of demeclocycline ( $C_{21}H_{21}ClN_2O_8$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 100 mg of Capsule contents, accurately weighed, in a capillary-stoppered bottle in vacuum at 60° for 3 hours: the material loses not more than 2.0% of its weight, except that if the Capsules contain starch the material loses not more than 8.0% of its weight.

**Assay—**

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the Assay under Demeclocycline.

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 10 Capsules, and weigh. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 50 mg of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ), to a 50-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Sonicate for 5 minutes, and centrifuge for 5 minutes. Pass a portion of the supernatant through a suitable filter having a 1.5- $\mu$ m or finer porosity, and use the clear filtrate as the Assay preparation.

*Procedure*—Proceed as directed for Procedure in the Assay under Demeclocycline. Calculate the quantity, in mg, of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ) in the portion of Capsule contents taken by the formula:

$$0.05CE(r_U / r_S)$$

in which the terms are as defined therein.

## Demeclocycline Hydrochloride Tablets

» Demeclocycline Hydrochloride Tablets contain not less than 90.0 percent and not more than 125.0 percent of the labeled amount of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Demeclocycline Hydrochloride RS

**Identification**—Shake a suitable quantity of finely powdered Tablets with methanol to obtain a solution containing about 1 mg of demeclocycline hydrochloride per mL, and filter. Using the filtrate as the Test Solution, proceed as directed for Method II under Identification—Tetracyclines (193).

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 75 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{21}H_{21}ClN_2O_8$  dissolved from UV absorption at the wavelength of maximum absorbance at about 274 nm on filtered portions of the solution under test, suitably diluted with Medium, if necessary, in comparison with a Standard solution having a known concentration of USP Demeclocycline Hydrochloride RS in the same Medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of demeclocycline ( $C_{21}H_{21}ClN_2O_8$ ) is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Loss on drying** (731)—Dry about 100 mg of finely ground Tablet powder, accurately weighed, in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 2% of its weight.

**Assay—**

*Mobile phase, Standard preparation, Resolution solution, and Chromatographic system*—Prepare as directed in the Assay under Demeclocycline.

*Assay preparation*—Weigh and finely powder not fewer than 10 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ), to a 50-mL volumetric flask, dilute with 0.01 N hydrochloric acid to volume, and mix. Sonicate for 5 minutes, and centrifuge for 5 minutes. Pass a portion of the supernatant through a suitable filter of 1.5- $\mu$ m or finer porosity, and use the clear filtrate as the Assay preparation.

*Procedure*—Proceed as directed for Procedure in the Assay under Demeclocycline. Calculate the quantity, in mg, of demeclocycline hydrochloride ( $C_{21}H_{21}ClN_2O_8 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$0.05CE(r_U / r_S)$$

in which the terms are as defined therein.

## Cryopreserved Human Fibroblast-Derived Dermal Substitute

» Cryopreserved Human Fibroblast-Derived Dermal Substitute is a living monolayer skin substitute derived from neonatal foreskins. It is composed of fibroblasts, an extracellular matrix, and a bioabsorbable scaffold. Human fibroblasts are seeded onto a bioabsorbable, nonantigenic and nonpyrogenic mesh scaffold composed of polyglactin, a copolymer of glycolide and lactide. The fibroblasts proliferate to fill the interstices of this scaffold to create a three-dimensional human dermal substitute that secretes human dermal collagen, matrix proteins, growth factors, and cytokines. Cryopreserved Human Fibroblast-Derived Dermal Substitute does not contain macrophages, lymphocytes, blood vessels, hair follicles, muscle fibers, or keratin. The fibroblast-cell banks, from which Cryopreserved Human Fibroblast-Derived Dermal Substitute is derived, test negative for human and animal viruses and retroviruses and are also tested for normal cell morphology, human karyology, and isoenzymes. Maternal blood sera are tested for evidence of infection with human immunodeficiency virus types 1 and 2, hepatitis B and C viruses, syphilis, and human T-lymphotropic virus type 1 and are found negative for the purpose of donor selection. Cryopreserved Human Fibroblast-Derived Dermal Substitute is manufactured with sterile components under aseptic conditions within the final package. Reagents used in the manufacture of Cryopreserved Human Fibroblast-Derived Dermal Substitute are tested and found free of viruses, retroviruses, endotoxins, and mycoplasma before use. All materials derived from bovine sources originate from countries free of bovine spongiform encephalopathy. During subsequent screening of the fibroblast cell strain at various

stages in the manufacturing process, testing for these same viruses, as well as Epstein-Barr virus and human T-lymphotropic virus type 2, is carried out and found to be negative. The final product tests negative for the presence of mycoplasma.

**Packaging and storage**—Cryopreserved Human Fibroblast-Derived Dermal Substitute is aseptically packaged and supplied frozen in a clear ethyl vinyl acetate bag containing one piece of approximately 5 cm × 7.5 cm for a single application. The solution within the bag is a saline-based cryoprotectant supplemented with 10% dimethyl sulfoxide and bovine serum to facilitate long-term storage. An aluminum-plastic foil envelope surrounds the bag for its protection. Cryopreserved Human Fibroblast-Derived Dermal Substitute should be stored at  $-75 \pm 10^\circ$  for no longer than 6 months.

**Labeling**—The label indicates the dimensions of the Cryopreserved Human Fibroblast-Derived Dermal Substitute material enclosed. It contains the expiry date, the required storage conditions, and the lot number. The label cautions that Cryopreserved Human Fibroblast-Derived Dermal Substitute is not to be used if the package shows signs of damage. Additional labeling requirements include instructions on the proper thawing and handling of Cryopreserved Human Fibroblast-Derived Dermal Substitute, the timeframe for use after package opening, and a statement that cytotoxic agents are not to be used.

**USP Reference standards** (11)—  
USP Endotoxin RS

**USP Authentic Visual References** (11)—USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrographs. [NOTE—These three photomicrographs represent examples of passing units. They are specified to assist in ascertaining histological quality.]

**Sterility** (71): meets the requirements.

**Test solution**—Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to a temperature of  $34^\circ$  to  $37^\circ$  for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Perform the test on 20 mL of the cryopreservative.

**Bacterial endotoxins** (85)—Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to a temperature of  $34^\circ$  to  $37^\circ$  for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Remove the unit from the ethyl vinyl acetate bag, and immerse in 25 mL of LAL Reagent Water. Extract for 60 minutes at  $37^\circ$  with shaking on an orbital shaker set at 125 revolutions per minute. Remove a 4-mL aliquot of the extract for testing: it contains not more than 0.5 USP Endotoxin Unit per mL.

#### **Histological characterization—**

**BUFFERED FORMALIN**—Prepare a solution containing 10% (w/v) formaldehyde solution and 1.0% to 1.5% methanol in a suitable buffer, adjusted to a pH of 6.8 to 7.2.<sup>1</sup>

**PREPARATION OF TISSUE FOR STAINING**—Cut Cryopreserved Human Fibroblast-Derived Dermal Substitute into 3-mm × 3-mm sections. Place three sections into suitable histological tissue cassettes,<sup>2</sup> and insert the cassettes into suitable histological cassette basket(s).<sup>3</sup> At a temperature of  $40^\circ$ , sequentially immerse the histological cassette basket(s) in separate

solutions of *Buffered formalin* (2 hours), two changes of 80% alcohol (30 minutes per step), alcohol (30 minutes), three changes of dehydrated alcohol (30 minutes per step), suitable histological xylene substitute (30 minutes),<sup>4</sup> and two changes of suitable xylene substitute (30 minutes per step). Immerse the histological cassette basket(s) into molten paraffin<sup>5</sup> that is at a temperature of  $60^\circ$  for 30 minutes. Remove the cassette basket(s), and immerse in a fresh container of molten paraffin ( $60^\circ$ ) for 60 minutes. Remove the histological tissue cassette from the container and basket, and disassemble. Fill preheated embedding molds with molten paraffin heated to  $56^\circ$  to  $60^\circ$ , and place on top of a preheated warming platform that is designed for histology work. Transfer Cryopreserved Human Fibroblast-Derived Dermal Substitute specimens from the cassettes using forceps, and place specimens into individual molds. Orient the specimens in molds so as to cut cross-sections. Cool the paraffin by sliding the mold down the platform to its cool side until the paraffin has solidified. Maintain specimen orientation with forceps during cooling, removing the forceps when the paraffin becomes translucent. Slide the paraffin block onto a histological cold plate to rapidly cool the block. Trim the paraffin block with a new single-edged razor blade to form a rectangle or slight trapezoid to within 5 mm of the tissue mass, if necessary. Cool the block at  $4^\circ$  for 15 to 30 minutes. Clamp the tissue block into the block holder of the microtome. Fill a histological tissue flotation water bath with fresh water, add an appropriate amount of a suitable histological adhesive,<sup>6</sup> and heat to  $5^\circ$  less than the melting point of the paraffin. Properly mount and adjust the tissue and paraffin block into a microtome. Set the microtome to make cuts 5 microns thick with a blade angle of  $5 \pm 2^\circ$ . Insert a sharp stainless steel microtome knife that has been properly honed or a new disposable microtome knife into the knife holder. Cut a ribbon that contains 6 to 10 sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute. Pick up the ribbon with forceps, and stretch it across the tissue flotation water bath. Separate 2 to 3 adjacent sections from the ribbon on the water bath. The selected sections should not be compressed, wrinkled, or scratched. Pick up the selected sections by dipping a microscope slide into the water bath under the floating sections, and gently lift the slide out of the water. For each staining procedure, prepare three slides from each of the three starting Cryopreserved Human Fibroblast-Derived Dermal Substitute 3-mm × 3-mm sections. Allow the mounted sections to air-dry completely, or dry the slide in a  $60^\circ$  oven for 1 hour.

#### **HEMATOXYLIN-EOSIN STAINING—**

**Hematoxylin-alcohol solution**—Dissolve 2.5 g of hematoxylin in 25.0 mL of dehydrated alcohol with heating.

**Potassium alum solution**—Dissolve 50.0 g of potassium alum in 500 mL of water with heating.

**Hematoxylin staining solution**—Mix *Hematoxylin-alcohol solution* and *Potassium alum solution*. Bring to a boil as rapidly as possible with constant stirring. Do not heat for more than 1 minute. Slowly add 0.185 g of sodium iodate. Reheat to a simmer until the solution becomes a deep purple. Remove from heat, and quickly cool. Filter daily before use.

**10% Acid alcohol**—Add 5.0 mL of hydrochloric acid to 495 mL of 70% alcohol.

**Eosin solution**—Dissolve 1 g of eosin Y in 100 mL of alcohol. Filter daily before use.

**Procedure**—The microscope slide with affixed tissue, as prepared in *Preparation of tissue for staining*, is sequentially immersed in three changes of a suitable histological, aliphatic xylene substitute (2 minutes per step), three changes of dehydrated alcohol (1 minute per step), alcohol

<sup>1</sup>A suitable *Buffered formalin* can be obtained from VWR International, 1310 Goshen Pkwy., West Chester, PA 19380.

<sup>2</sup>A suitable histological tissue cassette can be obtained from Sakura Finetek U.S.A., Inc., 1750 West 214th St., Torrance, CA 90501.

<sup>3</sup>A suitable histological tissue cassette basket can be obtained from Sakura Finetek U.S.A., Inc., 1750 West 214th St., Torrance, CA 90501.

<sup>4</sup>A suitable histological xylene substitute is Citrosolve® Clearing Agent, available from Fisher Scientific, 200 Park Ln., Pittsburgh, PA 15275.

<sup>5</sup>A suitable paraffin for use is Tissue Prep® 2 Embedding Media, available from Fisher Scientific, 200 Park Ln., Pittsburgh, PA 15275.

<sup>6</sup>A suitable histological adhesive for use is Histoslide® Adhesive, which can be obtained from Poly Scientific Research Corp., 70 Cleveland Ave., Bay Shore, NY 11706-1282.

(20 seconds), running tap water rinse (1 minute), *Hematoxylin staining solution* (4 to 5 minutes), running tap water rinse (1 minute), 10% *Acid alcohol* (15 seconds), running tap water rinse (1 minute), a suitable bluing reagent<sup>7</sup> (20 to 30 seconds), running tap water rinse (1 minute), alcohol (20 seconds), *Eosin solution* (10 to 20 seconds, until a red-dish-brown color is obtained in the tissue), three changes of dehydrated alcohol (10 seconds per step), and three changes of a suitable histological xylene substitute (10 seconds per step). Adjust the above immersion times as needed to suitably stain the tissue. Remove the slide from the last histological xylene substitute wash, and blot dry the back of the slide. Do not allow the tissue to dry. Affix a coverslip over the tissue using a coverslip mountant. Using USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrograph 1 for comparison, the test article shows a polyglactin scaffold mesh and a secreted collagen-based matrix; the tissue contains normal human fibroblast distributed throughout the secreted matrix and resembles normal human papillary dermis. Fibroblasts appear elongated and spindle-shaped. The tissue, which is about 100 to 300  $\mu\text{m}$  thick, contains about 106 cells per  $\text{cm}^2$ .

#### COLLAGEN STAINING—

*Bouin's solution*—Mix 75.0 mL of 1.22% picric acid solution, 25.0 L of dimethoxymethane, and 5.0 L of acetic acid.

*Weigert's iron hematoxylin solution A*—Dissolve 1.0 g of hematoxylin in 100.0 mL of alcohol.

*Weigert's iron hematoxylin solution B*—Mix 4.0 mL of 29% ferric chloride, 95.0 mL of water, and 1.0 mL of hydrochloric acid.

*Weigert's iron hematoxylin working solution*—Mix equal volumes of *Weigert's iron hematoxylin solution A* and *Weigert's iron hematoxylin solution B*. Pass the solution through a filter having a 0.45- $\mu\text{m}$  porosity. Prepare fresh as needed.

*Gomori's trichrome solution*—Mix 1.0 mL of acetic acid and 100 mL of water. Dissolve 0.6 g of chromotrope 2R, 0.3 g of Fast Green FCF, and 0.6 g of phosphotungstic acid.

1% *Acetic acid*—Mix 1.0 mL of acetic acid and 100 mL of water.

*Procedure*—The microscope slide with affixed tissue, as prepared in *Preparation of tissue for staining*, is sequentially immersed in three changes of a suitable histological, aliphatic xylene substitute (2 minutes per step), three changes of dehydrated alcohol (1 minute per step), alcohol (20 seconds), and running tap water rinse (1 minute). Immerse the slide in *Bouin's solution*, and place in a 42° water bath for 1 hour. Rinse the slide in water for 10 seconds. Sequentially immerse the slide in *Weigert's iron hematoxylin working solution* (10 minutes) and running tap water rinse (10 minutes). Rinse the slide in water for 10 seconds, and immerse in *Gomori's trichrome solution* (3 to 5 minutes). Rinse the slide in 1% *Acetic acid* for 20 seconds. Sequentially immerse the slide in three changes of alcohol (10 seconds per step) and three changes of a suitable histological, aliphatic xylene substitute (10 seconds per step). Affix a coverslip over the tissue using a suitable coverslip mountant. Nuclei will stain black; cytoplasm, keratin, and muscle fibers will stain red; and collagen and mucin will stain blue. Using USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrograph 2 for comparison, the tissue contains normal human fibroblast distributed throughout the secreted matrix and resembles normal human papillary; dermis, muscle fibers, and keratin are absent.

#### DISTRIBUTION OF FIBRONECTIN—

*Tris-saline buffer*—Prepare a solution containing 0.1 M tris(hydroxymethyl)aminomethane hydrochloride and 0.15 M sodium chloride, adjusted to a pH of 7.8.

3% *Hydrogen peroxide*—Mix 30 mL of hydrogen peroxide in water or methanol.

*Diaminobenzidine solution*—Use a suitable solution.<sup>8</sup>

*Hematoxylin staining solution*—Prepare as directed for *Hematoxylin-eosin staining*.

*Procedure*—The microscope slide with affixed tissue as prepared in *Preparation of tissue for staining* is dried either overnight at 37° or for 1 hour at 60°. The microscope slide with affixed tissue as prepared in *Preparation of tissue for staining* is sequentially immersed in three changes of a suitable histological, aliphatic xylene substitute (2 minutes per step), three changes of dehydrated alcohol (1 minute per step), alcohol (20 seconds), and running tap water rinse (1 minute). Sequentially immerse the slide in *Tris-saline buffer* (10 minutes), 3% *Hydrogen peroxide* (30 minutes), three changes of *Tris-saline buffer* (1 minute per step), a suitable normal rabbit serum<sup>9</sup> (30 minutes), water (5 minutes), and three changes of *Tris-saline buffer* (1 minute per step). Incubate the slide with a suitable solution of rabbit anti-human fibronectin antibody,<sup>10</sup> diluted using a suitable antibody diluent<sup>11</sup> to an antibody titer of  $21.0 \pm 2.1$  mg per L for 1 hour. Sequentially immerse the slide in water (5 minutes) and three changes of *Tris-saline buffer* (1 minute per step). Place enough drops of a biotinylated goat anti-rabbit antibody solution<sup>12</sup> to cover the tissue section, and incubate for 30 minutes. Sequentially immerse the slide in water (5 minutes) and three changes of *Tris-saline buffer* (1 minute per step). Place enough drops of a streptavidin conjugated horseradish peroxidase solution<sup>13</sup> to cover the tissue section, and incubate for 30 minutes. Sequentially immerse the slide in water (5 minutes) and three changes of *Tris-saline buffer* (1 minute per step). Incubate the slide with *Diaminobenzidine solution* for 1 to 5 minutes, until a suitable difference in staining is seen by comparison with a control in which the fibronectin (primary) antibody is omitted. Sequentially immerse the slide in water (1 minute), *Hematoxylin staining solution* (4 to 5 minutes), and water (1 minute). Do not allow the tissue to dry. Affix a coverslip over the tissue using a low-viscosity, aqueous, synthetic-resin coverslip mountant. Using USP Cryopreserved Human Fibroblast-Derived Dermal Substitute Reference Photomicrograph 3 for comparison, fibronectin is found colocalizing with the collagen fibers. The intensity of staining may vary from region to region of the slide.

#### Metabolic activity assessment—

*DPBS solution A*—Dissolve 1.32 g of calcium chloride and 1.21 g of magnesium sulfate heptahydrate in 2 L of water.

*DPBS solution B*—Dissolve 80.0 g of sodium chloride; 2.0 g of potassium chloride; 11.5 g of dibasic sodium phosphate; 2.0 g of monobasic potassium phosphate; 10.0 g of glucose; 0.36 g of sodium phosphate; 0.5 g of streptomycin sulfate; and 1,000,000 USP Units of penicillin G sodium in 8 L water.

*DPBS working solution*—Mix *DPBS solution B* with *DPBS solution A* (8:2). Pass the solution through a filter having a 0.22- $\mu\text{m}$  porosity.

*Dulbecco's modified Eagle's tissue culture medium*—Prepare a solution that contains the following components:

Component	mg per L
Calcium chloride	264.9
Ferric nitrate nonahydrate	0.10
Potassium chloride	400.0
Magnesium sulfate heptahydrate	200.0

<sup>8</sup>A suitable *Diaminobenzidine solution* can be obtained from Sigma-Aldrich Corp., P.O. Box 14508, St. Louis, MO 63178; catalog number D-6815.

<sup>9</sup>A suitable normal rabbit serum can be obtained from Dako Corp., 6392 Via Real, Carpinteria, CA 93013.

<sup>10</sup>Suitable rabbit anti-human fibronectin antibodies can be obtained from Dako Corp., 6392 Via Real, Carpinteria, CA 93013.

<sup>11</sup>Suitable antibody diluent can be obtained from Dako Corp., 6392 Via Real, Carpinteria, CA 93013.

<sup>12</sup>Suitable biotinylated goat anti-rabbit antibody solution can be obtained from BioGenex, 4600 Norris Canyon Rd., San Ramon, CA 94583.

<sup>13</sup>A suitable streptavidin conjugated horseradish peroxidase solution can be obtained from BioGenex, 4600 Norris Canyon Rd., San Ramon, CA 94583.

<sup>7</sup>A suitable bluing reagent can be obtained from Sigma-Aldrich Corp., P.O. Box 14508, St. Louis, MO 63178.

Component	mg per L
Sodium chloride	6,400.0
Sodium bicarbonate	3,700.0
Sodium phosphate, monobasic (monohydrate)	125.0
Dextrose	4,500.0
Phenol red	15.0
Sodium pyruvate	110.0
L-Arginine hydrochloride	84.0
L-Cystine	48.0
Aminoacetic acid	30.0
L-Histidine hydrochloride monohydrate	42.0
L-Isoleucine	104.8
L-Leucine	104.8
L-Lysine hydrochloride	146.2
L-Methionine	30.0
L-Phenylalanine	66.0
L-Serine	42.0
L-Threonine	95.2
L-Tryptophan	16.0
L-Tyrosine	72.0
L-Valine	93.6
D-Calcium pantothenate	4.0
Choline chloride	4.0
Folic acid	4.0
Inositol	7.0
Nicotinamide	4.0
Pyridoxine hydrochloride	4.0
Riboflavin	0.40
Thiamine hydrochloride	4.0

**L-Glutamine solution**—Prepare a 100-mL solution containing 2.92 g of L-glutamine.

**Sodium pyruvate solution**—Prepare 100 mL of a solution containing 1.10 g of sodium pyruvate.

**Antibiotic-antimycotic solution**—Prepare 100 mL of a solution containing 0.85 g of sodium chloride, 10,000 USP Units of penicillin G sodium, 10,000 µg of streptomycin (base), and 25 µg of amphotericin B.

**Assay stock medium**—Mix 1000 mL of *Dulbecco's modified Eagle's tissue culture medium*, 10 mL of *L-Glutamine solution*, 10 mL of *Sodium pyruvate solution*, 10 mL of *Antibiotic-antimycotic solution*, and 20 mL of fetal bovine serum.<sup>14</sup>

**MTT-assay solution**—Dissolve 0.50 g of 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl tetrazolium bromide in 1 L of *Assay stock medium*, using constant stirring. Sterilize the solution by passing it through a suitable filter having a 0.2-µm porosity.

**MTT formazan stock solution**—Prepare a solution containing 100 µg of 1-(4,5-dimethylthiazol-2-yl)-3,5-diphenylformazan per mL of isopropyl alcohol.

**MTT formazan calibration solutions**—Prepare solutions containing the following five MTT formazan concentrations: 15 µg per mL, 30 µg per mL, 45 µg per mL, 60 µg per mL, and 75 µg per mL of MTT formazan, using *MTT formazan stock solution* and diluting with isopropyl alcohol.

**Procedure**—Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to between 34° and 37° for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Cut three 11-mm × 11-mm sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute, and immerse the sections into separate, 3.0-mL portions of *MTT-assay solution*. Incubate for 2 hours at 37 ± 2° in a 3% to 7% CO<sub>2</sub>-air environment with shaking on an orbital shaker at 150 to 200 rpm. After incu-

bation remove from the 37°, 3% to 7% CO<sub>2</sub>-air environment. Remove the *MTT-assay solution*, and rinse twice with *DPBS working solution*. Immerse the Cryopreserved Human Fibroblast-Derived Dermal Substitute in 2 mL of isopropyl alcohol, and incubate at ambient temperature for 1 hour with shaking on an orbital shaker at approximately 125 rpm. Transfer 200-µL aliquots of the five *MTT formazan calibration solutions*, in triplicate, and 200-µL aliquots of the three isopropyl alcohol extracts of Cryopreserved Human Fibroblast-Derived Dermal Substitute to a suitable 96-well flat-bottom plate. Read the absorbance of each aliquot at 540 nm, using 200 µL of isopropyl alcohol as the blank. Plot the responses of the *MTT formazan calibration solutions* versus concentration, in µg of MTT formazan per mL, and calculate the regression line using the least-squares method; the test is considered valid if the regression line has a square of the correlation coefficient not less than 0.95: the absorbance value of individual, thawed, Cryopreserved Human Fibroblast-Derived Dermal Substitute sections is between 0.30 and 0.86.

#### DNA content—

**Cell culture water**—Use sterile water containing not more than 0.005 USP Endotoxin Unit per mL.

**DNA extraction buffer**—Transfer about 850 mL of *Cell culture water* to a sterile, 1-L graduated container. Dissolve 12.110 g of 2-amino-2-hydroxymethyl-1,3-propanediol, 3.802 g of edetate disodium, 23.380 g of sodium chloride, and 0.080 g of sodium dodecyl sulfate, with stirring. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 7.0. Dilute with *Cell culture water* to 1 L.

**Proteinase K solution**—Prepare a solution of *Tritirachium album* proteinase K in 10 mM of 2-amino-2-hydroxymethyl-1,3-propanediol, adjusted to a pH of 7.5, having an activity of 600 units per mL.<sup>15</sup>

**Working DNA extraction buffer**—Add 1.22 mL of *Proteinase K solution* to 38.78 mL of *DNA extraction buffer*, and mix.

**Dilution buffer**—Transfer 850 mL of *Cell culture water* to a sterile, 1-L graduated container. Add 1.211 g of 2-amino-2-hydroxymethyl-1,3-propanediol, 3.802 g of edetate disodium, and 5.844 g of sodium chloride, with stirring. Adjust with 1 N hydrochloric acid or 1 N sodium hydroxide to a pH of 7.0. Dilute with *Cell culture water* to 1 L.

**DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution**—Prepare a solution containing 8.00 g of sodium chloride, 1.15 g of dibasic sodium phosphate (anhydrous), 0.20 g of potassium chloride, and 0.20 g of monobasic potassium phosphate per L.

**Calf thymus DNA solution**—Prepare a solution containing 1 mg of calf thymus DNA per mL of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*, mixing thoroughly for 12 to 24 hours at ambient temperature. Dilute the resulting solution with *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution* to prepare a solution containing 50 µg of calf thymus DNA per mL, mixing thoroughly on a vortex mixer for 10 minutes.

**Calf thymus DNA calibration solutions**—Prepare four calibration solutions containing 5 µg per mL, 10 µg per mL, 15 µg per mL, and 20 µg per mL of calf thymus DNA, using *Calf thymus DNA solution* and diluting with *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*.

**DNA staining solution**—Prepare a solution containing 0.5 µg of 2'-(4-hydroxyphenyl)-5-(4-methyl-1-piperazinyl)-2,5'-bi-1H-benzimidazole trihydrochloride pentahydrate per mL of *Dilution buffer*. Store in low-actinic glassware.

**Procedure**—Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to between 34° and 37° for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Cut three 11-mm × 11-mm sections of Cryopreserved Human Fibroblast-De-

<sup>14</sup>A suitable fetal bovine serum can be obtained from HyClone, 925 West 1800 South, Logan, UT 84321; catalog number SH30070.03.

<sup>15</sup>A suitable *Proteinase K solution* can be obtained from Roche Diagnostics Corp., Roche Applied Sciences, P.O. Box 50414, 9115 Hague Rd., Indianapolis, IN 46250-0414.

rived Dermal Substitute. To each of three microcentrifuge tubes add 1 mL of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*. Immerse a single Cryopreserved Human Fibroblast-Derived Dermal Substitute 11-mm × 11-mm section into each microcentrifuge tube to remove the cryopreservative. Aspirate the *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution* from each tube, and replace with 1 mL of *Working DNA extraction buffer*, making sure that each Cryopreserved Human Fibroblast-Derived Dermal Substitute is completely submerged in the extraction buffer. Incubate the samples in a 56° to 60° water bath for 4 to 18 hours. Sonicate for 10 to 15 seconds using an ultrasonic cell disrupter to achieve complete cellular disruption of the tissue and to mix the contents of the tube. Centrifuge the microcentrifuge tubes at 12,000 to 15,000 × *g* to pellet non-DNA material. Transfer three 50-μL aliquots of each sample supernatant to individual wells of a 96-well black plate suitable for performing fluorescent analysis. Transfer triplicate 50-μL aliquots of each of the *Calf thymus DNA calibration solutions* to the 96-well plate, as well as a 50-μL aliquot of *DPBS working solution* for the blank. Add 150 μL of *DNA staining solution* to all wells containing the tissue samples, *Calf thymus DNA calibration solutions*, and the blank. Cover with aluminum foil, and place in a dark cabinet for 30 to 45 minutes at 15° to 30°. Read the fluorescence of each well, using an excitation wavelength of 355 nm and an emission wavelength of 460 nm, blanking against the *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution* well. Plot the responses of the *Calf thymus DNA calibration solutions* versus concentration, in μg of calf thymus DNA per mL, and calculate the regression line using the least-squares method. The test is considered valid if the %CV of the replicate values is less than 15%, the slope is between 4.48 and 6.27, the *y*-intercept is between -2.04 and 3.65, and the square of the correlation coefficient is not less than 0.990. From the regression line so obtained, determine the amount of DNA, in μg per 11-mm × 11-mm sample: the amount of DNA of individual Cryopreserved Human Fibroblast-Derived Dermal Substitute 11-mm × 11-mm section is between 6 and 15 μg.

#### Total collagen content—

*DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*—Proceed as directed for DNA content.

*DPBS with Ca<sup>++</sup>, Mg<sup>++</sup> solution*—Prepare a solution containing 8.00 g of sodium chloride, 1.15 g of dibasic sodium phosphate (anhydrous), 0.20 g of potassium chloride, 0.20 g of monobasic potassium phosphate, 0.10 g of magnesium chloride hexahydrate, and 0.10 g of calcium chloride (anhydrous) per L.

*Collagenase extraction solution*—Prepare a solution of *Clostridium histolyticum* collagenase, type 2, in *DPBS with Ca<sup>++</sup>, Mg<sup>++</sup> solution* having an activity of at least 250 units per mL.

*2% Acetic acid solution*—Mix 10 mL of acetic acid with 490 mL of water.

*Collagen standard stock solution*—Prepare a solution having a concentration of 2 mg of collagen, type I, per mL of *2% Acetic acid solution*.

*Collagen calibration standards*—Cut polyglactin mesh<sup>16</sup> into seventeen 11-mm × 11-mm squares, and place one square into 17 individual wells of a 24-well plate. Each well of the 24-well plate has a surface area of about 220 mm<sup>2</sup> and a volume of about 3.5 mL. In quadruplicate, prepare wells containing 0.050 mg, 0.100 mg, 0.200 mg, and 0.400 mg of collagen by adding 25 mL, 50 mL, 100 mL, and 200 mL, respectively, of the *Collagen standard stock solution*. The remaining well to which no *Collagen standard stock solution* has been added is used as the blank. Allow the wells to air dry.

*Sirius red solution*—Dissolve 0.5 g of Direct Red 80 in 500 mL of saturated picric acid.

<sup>16</sup>A suitable polyglactin mesh can be obtained from Ethicon Co., Johnson & Johnson Corp., 425 Hoes Ln., P.O. Box 6800, Piscataway, NJ 08855.

*1% (p-tert-Octylphenoxy)polyethoxyethanol solution*—Mix 10 mL of (p-tert-octylphenoxy)polyethoxyethanol in 990 mL of *DPBS with Ca<sup>++</sup>, Mg<sup>++</sup> solution*.

*Procedure*—Thaw Cryopreserved Human Fibroblast-Derived Dermal Substitute by placing the tissue, still in its ethyl vinyl acetate bag, in a water bath heated to between 34° and 37° for 2 to 3 minutes. The minimum amount of water in the water bath is 2 L per Cryopreserved Human Fibroblast-Derived Dermal Substitute unit. Cut three 11-mm × 11-mm sections of Cryopreserved Human Fibroblast-Derived Dermal Substitute. Place each test section into separate wells of a 24-well plate. Add 200 μL of *1% (p-tert-Octylphenoxy)polyethoxyethanol solution* to each sample. Shake on a rotating platform shaker at 100 to 150 rpm for 60 to 70 minutes at room temperature. Aspirate off the *1% (p-tert-Octylphenoxy)polyethoxyethanol solution*, and rinse three times with 2 mL of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*. Transfer each of the collagen standards to individual wells of the 24-well plate. Add 0.5 mL of *Sirius red solution* to each test sample and collagen standards. Shake on a rotating platform shaker at 100 to 150 rpm for 60 minutes at room temperature. Aspirate off the *Sirius red solution* from each well. Rinse each well twice with 2 mL of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*. Add an additional 2 mL of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution* to each well, and allow to stand for 2 minutes. Aspirate off the *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*, and rinse twice more with 2 mL of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*. Aspirate off all traces of *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution*. Add 0.5 mL of *Collagenase extraction solution* to each well containing the *Collagen calibration standards*. Add 2.0 mL of *Collagenase extraction solution* to each well containing test samples. Rotate the plate on an orbital rotator at about 150 rpm for 90 minutes at 37°. Transfer 200 μL from each well, and transfer to a suitable 96-well flat-bottom plate. Read the absorbance of each aliquot at 540 nm. Dilute the Cryopreserved Human Fibroblast-Derived Dermal Substitute sample preparation further with *DPBS without Ca<sup>++</sup>, Mg<sup>++</sup> solution* if the absorbance is greater than the absorbance of the highest of the *Collagen calibration standards*. Plot the responses of the *Collagen calibration standards* versus the amount, in mg of collagen, and calculate the regression line using the least-squares method. The test is considered valid if the slope is between 3.00 and 5.00 and the square of the correlation coefficient is greater than or equal to 0.950. Determine the mg of collagen per Cryopreserved Human Fibroblast-Derived Dermal Substitute section from the regression line and using the following equation:

$$CC_{SR} = Df \times A \times SC_{SR}$$

in which  $CC_{SR}$  is the collagen content of the piece, in mg;  $Df$  is the dilution factor (normally 4, unless the sample had to be further diluted);  $A$  is the absorbance at 540 nm; and  $SC_{SR}$  is the slope of the regression line of the standards calculated above. The test is considered valid if the slope of the regression line is between 3.00 and 5.00 and has a square of the correlation coefficient greater than 0.950: the amount of collagen in individual Cryopreserved Human Fibroblast-Derived Dermal Substitute 11-mm × 11-mm samples is between 0.40 and 2.0 mg.

## Desflurane

C<sub>3</sub>H<sub>2</sub>F<sub>6</sub>O  
Ethane, 2-(difluoromethoxy)-1,1,1,2-tetrafluoro-, (±)-;  
(±)-2-Difluoromethyl 1,2,2,2-tetrafluoroethyl ether  
[57041-67-5].

168.04

**DEFINITION**

Desflurane contains NLT 99.7% and NMT 100.0% of  $C_3H_2F_6O$ .

**IDENTIFICATION**

- The IR absorption spectrum of Desflurane obtained using a gas cell exhibits maxima only at the same wavelengths as that of a similar preparation of USP Desflurane RS.

**ASSAY****PROCEDURE**

Using the results from the *Organic Impurities* procedure, calculate the percentage of  $C_3H_2F_6O$  in the sample of Desflurane taken by subtracting the sum of all impurities found from 100.0%.

**Acceptance criteria:** 99.7%–100.0%

**IMPURITIES****Inorganic Impurities**

- LIMIT OF NONVOLATILE RESIDUE:** Transfer 20.0 mL of Desflurane to an evaporating dish, and evaporate with a stream of nitrogen to dryness: the weight of the residue does not exceed 2.0 mg (0.01%).

**LIMIT OF ANTIMONY**

**Diluent A:** Nitric acid and water (1:1)

**Diluent B:** Nitric acid and hydrochloric acid (9:1)

**Standard solutions:** Transfer 0.1 mL (234 mg) of antimony pentachloride to a 50-mL volumetric flask, dilute with *Diluent B* to volume, and mix. This stock solution contains about 1906 µg of antimony/mL. Dilute a portion of this solution quantitatively and stepwise with *Diluent B* to obtain *Standard solutions* containing 2.5, 5.0, and 10.0 µg of antimony/mL.

**Sample solution:** Weigh a stoppered stock bottle containing a quantity of Desflurane at ambient temperature, and then cool it in powdered dry ice. Using a cold syringe, transfer 5–7 mL of Desflurane from the cold bottle to a separator containing 20 mL of *Diluent A*. Allow the stock bottle containing the remaining Desflurane to come to ambient temperature, weigh it, and calculate the quantity, in g, of Desflurane taken for the test. Allow the Desflurane in the separator to evaporate, and with the aid of a few mL of *Diluent A*, transfer the acid solution to a clean, dry beaker. Add 1 mL of hydrochloric acid to the solution in the beaker, and reduce the volume to 8 mL by evaporating on a hot plate. Transfer this solution to a 10-mL volumetric flask, and dilute with *Diluent B* to volume.

**Spectrometric conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Atomic absorption spectrophotometer

**Analytical wavelength:** Antimony emission line at 217.6 nm

**Lamp:** Antimony hollow-cathode

**Flame:** Air–acetylene

**Blank:** *Diluent B*

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*

**Calculation:** Plot the absorbances of the *Standard solutions* versus the concentration (µg/mL) of antimony, and draw the straight line best fitting the three plotted points. From the graph so obtained, determine the concentration of antimony in the *Sample solution*. Calculate the quantity, in µg/g, of antimony in the portion of Desflurane taken:

$$\text{Result} = (C/W) \times V$$

- C = concentration of antimony in the *Sample solution* (µg/mL)  
 W = weight of Desflurane taken to prepare the *Sample solution* (g)  
 V = volume of *Sample solution*

**Acceptance criteria:** NMT 3 µg/g

**LIMIT OF FLUORIDE**

[NOTE— Store all solutions except *Solution A* in plastic containers.]

**Solution A:** 57 mL of glacial acetic acid, 58 g of sodium chloride, and 4 g of (1,2-cyclohexylenedinitrilo)tetraacetic acid in 500 mL of water. Adjust with 5 N sodium hydroxide to a pH of  $5.25 \pm 0.25$ , and dilute with water to 1000 mL. An equivalent commercial preparation may be used.

**Standard stock solution:** 2210 µg/mL of USP Sodium Fluoride RS in water. Each mL of this solution contains 1000 µg of fluoride/mL.

**Standard solutions:** Dilute volumes of *Standard stock solution* with *Solution A* to obtain solutions with concentrations of 0.1, 0.3, 0.5, 1.0, 3.0, and 5.0 µg of fluoride/mL.

**Sample solution:** Transfer 20.0 mL of Desflurane to a 60-mL separator, add 20.0 mL of water, shake for 1 min, and allow the layers to separate. Drain the lower organic layer and a small portion of the aqueous layer into a beaker, and discard. Transfer 10.0 mL of the aqueous phase remaining in the separator to a plastic cup, and add 10.0 mL of *Solution A*.

**Analysis**

**Samples:** *Standard solutions* and *Sample solution*

Concomitantly measure the potentials (see pH (791)), in mV, of the *Samples* with a pH meter capable of a minimum reproducibility of  $\pm 0.2$  mV and equipped with a fluoride-specific ion-indicating electrode and a calomel reference electrode.

[NOTE—When taking measurements, immerse the electrodes in the solution, stir with a polytetrafluoroethylene-coated stirring bar and a magnetic stirrer having an insulated top until equilibrium is attained (about 1–2 min), and record the potential. Rinse the electrodes with *Solution A*, and dry, taking care to avoid damaging the crystal of the specific-ion electrode.]

Plot the logarithms of the fluoride concentrations (µg/mL) of the *Standard solutions* versus the potential, in mV. From the measured potential of the *Sample solution* and the standard response line, determine the concentration, C (µg/mL), of fluoride in the *Sample solution*. Multiply C by 0.0002 to obtain the percentage of fluoride in the portion of Desflurane taken.

**Acceptance criteria:** NMT 0.001%

**Organic Impurities****PROCEDURE**

**Standard stock solution:** To a suitable tared vial, fitted with a septum, add 20 mL (29.4 g) of Desflurane. Seal and re-weigh the vial to determine the weight of Desflurane added. To this vial sequentially add 20 µL of USP Desflurane Related Compound A RS, 23 µL of dichloromethane, 20 µL of chloroform, 38 µL of acetone, and 21 µL of USP Isoflurane RS. Record the weight after the addition of each impurity and determine the total weight.

Calculate the percentage of each impurity in the *Standard stock solution*:

$$\text{Result} = W_i/W_T \times P_i$$

- $W_i$  = weight of each impurity added (g)  
 $W_T$  = total weight of the *Standard stock solution* (g)  
 $P_i$  = purity of each impurity added (%)

**Standard solution:** To a suitable tared vial, fitted with a septum, add 10.2 mL (15 g) of Desflurane. Seal and re-weigh the vial to determine the weight of Desflurane added. To this vial add 250 µL of the *Standard stock solution*, and record the weight to determine the weight of the *Standard stock solution* added and the final weight of the *Standard solution*.

Calculate the spiked concentration ( $C_s$ ) of each impurity in the *Standard solution*:

$$\text{Result} = W_i/W_T \times C_i$$

$W_i$  = weight of *Standard stock solution* added (g)  
 $W_T$  = total weight of the *Standard solution* (g)  
 $C_i$  = concentration of each impurity in the *Standard stock solution* (%)

**System suitability solution:** To a suitable vial, fitted with a septum, add 10.2 mL (15 g) of Desflurane. Seal the vial. To this vial add 100  $\mu$ L of the *Standard stock solution*.

**Sample:** Desflurane

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 0.32-mm  $\times$  105-m capillary column coated with 1.5- $\mu$ m film of G6

**Carrier gas:** Helium

**Autosampler/Syringe temperature:** 2°–5°

**Flow rate:** 3 mL/min

**Split flow:** 25 mL/min

**Temperature**

**Injection port:** 150°

**Detector:** 200°

**Column:** See the temperature program table below.

Initial Temperature (°)	Temperature Ramp (°/min)	Final Temperature (°)	Hold Time at Final Temperature (min)
30	—	30	11
30	20	50	13

**Injection size:** 3  $\mu$ L

#### System suitability

**Samples:** *Standard solution* and *System suitability solution*

#### Suitability requirements

**Resolution:** NLT 3.0 between isoflurane and dichloromethane, *Standard solution*

**Tailing factor:** NMT 1.5 for isoflurane, *Standard solution*

**Relative standard deviation:** NMT 5% for each impurity, *Standard solution*

**Signal-to-noise ratio:** NLT 40 for isoflurane, *System suitability solution*

#### Analysis

[NOTE—Injections of Desflurane used to prepare the *Standard solution* must be made to estimate the amount of known impurities that may be present in the solvent. The final concentration of each impurity is equal to the concentration of the impurity added plus the concentration inherent in the matrix.]

**Samples:** *Standard solution* and *Sample solution*

Calculate the final concentration of each impurity in the *Standard solution*:

$$\text{Result} = r_U/(r_S - r_U) \times C_S + C_S$$

$r_U$  = peak response of each impurity from the Desflurane used as the solvent

$r_S$  = peak response of each impurity from the *Standard solution*

$C_S$  = spiked concentration of each impurity in the *Standard solution* (%)

Calculate the percentage of each impurity observed in the *Sample solution* that is also present in the *Standard solution*:

$$\text{Result} = (r_U/r_S) \times C_F$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of each impurity from the *Standard solution*

$C_F$  = final concentration of each impurity in the *Standard solution* (%)

Calculate the percentage of all other impurities:

$$\text{Result} = (r_U/r_S) \times C_S \times 1/F$$

$r_U$  = peak response of each impurity from the *Sample solution*

$r_S$  = peak response of Isoflurane from the *Standard solution*

$C_S$  = concentration of USP Isoflurane RS in the *Standard solution* (%)

$F$  = relative response factor relative to isoflurane (see *Impurity Table 1*)

**Acceptance criteria:** See *Impurity Table 1*.

**Total impurities:** NMT 0.3%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
Desflurane <sup>a</sup>	1.0	—	—
Dichlorofluoromethane	1.04	0.43	0.01
Trichlorofluoromethane	1.07	0.15	0.001
Desflurane related compound A <sup>b,a</sup>	1.12	—	0.10
Trichlorotrifluoroethane	1.35	1.3	0.001
Dichloromethane <sup>a</sup>	1.44	—	0.001
Isoflurane <sup>a</sup>	1.55	1.0	0.20
Chloroform <sup>a</sup>	1.88	—	0.006
Acetone <sup>a</sup>	2.12	—	0.010

<sup>a</sup> These impurities are present in the *Standard solution* and are quantified by external standards.

<sup>b</sup> Bis-(1,2,2,2-tetrafluoroethyl)ether.

#### SPECIFIC TESTS

##### • ACIDITY OR ALKALINITY

**Bromocresol purple solution:** 0.5 mg/mL of bromocresol purple. Prepared by dissolving 50 mg of bromocresol purple in 0.92 mL of 0.1 M sodium hydroxide and 20 mL of ethanol, and then diluting with water to 100 mL.

**Sample solution:** Transfer 20 mL of Desflurane to a separatory funnel, and add 20 mL of carbon dioxide-free water. Shake for 3 min, allow the layers to separate, and discard the lower organic layer. Collect the upper layer, and add 0.2 mL of *Bromocresol purple solution*.

**Acceptance criteria:** NMT 0.1 mL of 0.01 M sodium hydroxide or 0.6 mL of 0.01 M hydrochloric acid is required to change the color of the indicator.

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers. Store at controlled room temperature. Replace the cap securely after each use.

##### • USP REFERENCE STANDARDS <11>

USP Desflurane RS

USP Desflurane Related Compound A RS

Bis-(1,2,2,2-tetrafluoroethyl)ether.

USP Isoflurane RS

USP Sodium Fluoride RS

## Desipramine Hydrochloride

$C_{18}H_{22}N_2 \cdot HCl$  302.84

5*H*-Dibenz[*b,f*]azepine-5-propanamine, 10,11-dihydro-*N*-methyl-, monohydrochloride.

10,11-Dihydro-5-[3-(methylamino)propyl]-5*H*-dibenz[*b,f*]azepine monohydrochloride [58-28-6].

» Desipramine Hydrochloride, dried in vacuum at 105° for 2 hours, contains not less than 98.0 percent and not more than 100.5 percent of  $C_{18}H_{22}N_2 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Desipramine Hydrochloride RS

USP Iminodibenzyl RS  
 $C_{14}H_{13}N$  195.28

**Identification**—

**A:** Infrared Absorption (197M).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 30 µg per mL.

*Medium:* 0.1 N hydrochloric acid.

Absorptivities at 251 nm, calculated on the dried basis, do not differ by more than 2.0%.

**C:** Add about 5 mg to 2 mL of nitric acid on a spot plate; an intense blue color is produced.

**D:** A 1 in 20 solution in alcohol responds to the tests for Chloride (191).

**Loss on drying** (731)—Dry it in vacuum at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.001%.

**Limit of iminodibenzyl**—

*Standard solution*—Dissolve an accurately weighed quantity of USP Iminodibenzyl RS in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a solution having a concentration of 50 µg per mL. Transfer 1.0 mL of this solution to a low-actinic, 25-mL volumetric flask, add 10 mL of a mixture of equal volumes of hydrochloric acid and alcohol, and mix.

*Test solution*—Transfer 50.0 mg of Desipramine Hydrochloride to a low-actinic, 25-mL volumetric flask, add 10 mL of a mixture of equal volumes of hydrochloric acid and alcohol, and mix.

*Procedure*—To the two flasks containing the *Standard solution* and the *Test solution*, and to a third flask containing 10 mL of a mixture of equal volumes of hydrochloric acid and alcohol to provide the blank, add slowly 5 mL of a 0.4% (v/v) solution of furfural in alcohol, mix, then add 5 mL of hydrochloric acid, and allow the flasks to stand in a constant-temperature bath at 25° for 3 hours. Dilute each flask with a mixture of equal volumes of hydrochloric acid and alcohol to volume, and mix. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 565 nm, with a suitable spectrophotometer, using the blank to set the instrument: the absorbance of the solution obtained from the *Test solution* is not greater than that obtained from the *Standard solution* (0.1%).

**Assay**—Dissolve about 0.6 g of Desipramine Hydrochloride, previously dried and accurately weighed, in 100 mL of gla-

cial acetic acid, add 10 mL of mercuric acetate TS, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically, using a calomel-glass electrode system. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 30.29 mg of  $C_{18}H_{22}N_2 \cdot HCl$ .

## Desipramine Hydrochloride Tablets

» Desipramine Hydrochloride Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_{18}H_{22}N_2 \cdot HCl$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Desipramine Hydrochloride RS

**Identification**—Finely powder a number of Tablets, equivalent to about 350 mg of desipramine hydrochloride, and triturate the powder with 15 mL of chloroform. Filter the chloroform extract through paper into a wide-mouth test tube, and evaporate the filtrate to about 3 mL. Carefully add ether until the liquid becomes turbid, heat cautiously to produce a clear solution, then cool, and allow to stand. Collect the crystals, wash with ether, and dry in vacuum at 80° for 30 minutes: the desipramine hydrochloride so obtained responds to *Identification test A* under *Desipramine Hydrochloride*.

**Dissolution** (711)—

*Medium:* 0.1 N hydrochloric acid; 900 mL.

*Apparatus 2:* 50 rpm.

*Time:* 60 minutes.

*Procedure*—Determine the amount of  $C_{18}H_{22}N_2 \cdot HCl$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 251 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Desipramine Hydrochloride RS in the same *Medium*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{18}H_{22}N_2 \cdot HCl$  is dissolved in 60 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Transfer 1 finely powdered Tablet to a 100-mL volumetric flask, add 50 mL of 0.1 N hydrochloric acid, and shake by mechanical means for 15 minutes. Dilute with 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 20 mL of the filtrate. Dilute a portion of the subsequent filtrate quantitatively and stepwise with 0.1 N hydrochloric acid to provide a solution containing approximately 25 µg of desipramine hydrochloride per mL. Concomitantly determine the absorbances of this solution and a Standard solution of USP Desipramine Hydrochloride RS in the same medium having a known concentration of about 25 µg per mL in 1-cm cells at the wavelength of maximum absorbance at about 251 nm, with a suitable spectrophotometer, using 0.1 N hydrochloric acid as the blank. Calculate the quantity, in mg, of  $C_{18}H_{22}N_2 \cdot HCl$  in the tablet taken by the formula:

$$(TC/D)(A_U/A_S)$$

in which *T* is the labeled quantity, in mg, of desipramine hydrochloride in the Tablet, *C* is the concentration, in µg per mL, of USP Desipramine Hydrochloride RS in the Standard solution, *D* is the concentration, in µg per mL, of desipramine hydrochloride in the test solution, based upon the labeled quantity per Tablet and the extent of dilution,

and  $A_U$  and  $A_S$  are the absorbances of the solution from the Tablet and the Standard solution, respectively.

#### Assay—

**Standard preparation**—Dissolve a suitable quantity of USP Desipramine Hydrochloride RS, accurately weighed, in 0.1 N hydrochloric acid, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 25 µg per mL.

**Assay preparation**—Finely powder a number of Tablets, equivalent to about 0.5 g of desipramine hydrochloride, and transfer the powder to a 500-mL volumetric flask with the aid of 100 mL of 0.1 N hydrochloric acid. Add 150 mL of the 0.1 N acid to the mixture, insert the stopper, and shake by mechanical means for 30 minutes. Dilute with 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 10 mL of the filtrate. Transfer 5.0 mL of the subsequent filtrate to a 200-mL volumetric flask, dilute with 0.1 N hydrochloric acid to volume, and mix.

**Procedure**—Transfer 15.0 mL each of the *Standard preparation* and the *Assay preparation*, respectively, to separate glass-stoppered, 50-mL centrifuge tubes, and to each tube add 2 mL of 2.5 N sodium hydroxide and 15.0 mL of cyclohexane suitable for use in UV spectrophotometry. Insert the stoppers, shake the tubes by mechanical means for 30 minutes, and centrifuge at about 1500 rpm until the clear phases separate (5 to 10 minutes). Concomitantly determine the absorbances of the cyclohexane extracts in 1-cm cells at the wavelength of maximum absorbance at about 255 nm, with a suitable spectrophotometer, using cyclohexane suitable for use in UV spectrophotometry as the blank. Calculate the quantity, in mg, of  $C_{18}H_{22}N_2 \cdot HCl$  in the portion of Tablets taken by the formula:

$$20C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Desipramine Hydrochloride RS in the *Standard preparation*, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Deslanoside

$C_{47}H_{74}O_{19}$  943.08

Card-20(22)-enolide, 3-[(O-β-D-glucopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribo-hexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribo-hexopyranosyl)oxy]-12,14-dihydroxy-, (3β,5β,12β)-. Deacetyl lanatoside C [17598-65-1].

» Deslanoside contains not less than 95.0 percent and not more than 103.0 percent of  $C_{47}H_{74}O_{19}$ , calculated on the dried basis.

**Caution**—Handle Deslanoside with exceptional care, since it is highly potent.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**USP Reference standards** (11)—  
USP Deslanoside RS

**Identification**—Prepare a solution of it in methanol containing about 4 mg per mL. Apply 5 µL of this solution and 5 µL of a methanol solution of USP Deslanoside RS containing 4 mg per mL to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of methylene chloride, methanol, and water (130:36:3) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute perchloric acid (1 in 20) and heating at about 100° for 3 minutes. Cool, and examine under UV light: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the Standard solution.

**Specific rotation** (781S): between +7.0° and +8.5°.

**Test solution:** 20 mg per mL, in anhydrous pyridine.

**Loss on drying** (731)—Dry 0.5 g in vacuum at 100° to constant weight: it loses not more than 5.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

#### Assay—

**Standard preparation**—Dissolve a suitable quantity of USP Deslanoside RS in alcohol, and quantitatively dilute with alcohol to obtain a solution having a known concentration of about 200 µg per mL.

**Assay preparation**—Transfer about 20 mg of Deslanoside, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with alcohol to volume, and mix.

**Procedure**—Transfer 3.0 mL each of the *Standard preparation*, the *Assay preparation*, and alcohol to provide the blank, to separate 25-mL conical flasks. Evaporate each with gentle warming and with the aid of a current of air just to dryness, and cool in a vacuum desiccator for 30 minutes. Add 15.0 mL of acid-ferric chloride TS to each flask, mix by swirling, and allow the mixtures to stand protected from light, swirling frequently, at a temperature not exceeding 30°, for 15 minutes. Pass each through separate fine glass wool filters. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 590 nm, with a suitable spectrophotometer, using the blank to set the instrument. Repeat the measurements at 2-minute intervals until maximum absorbance readings have been obtained. Calculate the quantity, in mg, of  $C_{47}H_{74}O_{19}$  in the Deslanoside taken by the formula:

$$0.1C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Deslanoside RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the maximum absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Deslanoside Injection

» Deslanoside Injection is a sterile solution of Deslanoside in a suitable solvent. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{47}H_{74}O_{19}$ . It may contain Glycerin.

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass.

**USP Reference standards** (11)—  
USP Deslanoside RS

**Identification**—Transfer a volume of Injection, equivalent to about 2 mg of deslanoside, to a small separator, and ex-

tract with 25 mL of a mixture of 7 volumes of chloroform and 3 volumes of alcohol. Transfer the extract to a 10-mL conical flask, evaporate on a steam bath to dryness, and dissolve the residue in 500  $\mu$ L of methanol. Proceed with a 5- $\mu$ L portion of the solution so obtained, as directed in the *Identification* test under *Deslanoside*, beginning with "Apply 5  $\mu$ L of this solution." The specified result is obtained.

**pH** (791): between 5.5 and 7.0.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Standard preparation**—Prepare as directed in the *Assay* under *Deslanoside*.

**Assay preparation**—Transfer a volume of Injection, equivalent to about 600  $\mu$ g of deslanoside, to a separator, and add 50 mL of water and 1 mL of 2 N sulfuric acid. Extract with four 30-mL portions of a mixture of 5 volumes of chloroform and 1 volume of *n*-propyl alcohol, washing each portion in a second separator containing 5 mL of water and filtering through cotton that previously has been moistened with chloroform. Combine the extracts, and evaporate on a steam bath, with the aid of a current of air, just to dryness. Transfer the residue, with the aid of a small volume of the chloroform-*n*-propyl alcohol mixture, to a 25-mL conical flask.

**Procedure**—Transfer 3.0 mL each of the *Standard preparation* and of alcohol to provide the blank to separate 25-mL conical flasks. Using these solutions and the *Assay preparation*, proceed as directed for *Procedure* in the *Assay* under *Deslanoside*, beginning with "Evaporate each with gentle warming." Calculate the quantity, in  $\mu$ g, of  $C_{47}H_{74}O_{19}$  in each mL of the Injection taken by the formula:

$$(C / V)(A_U / A_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Deslanoside RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $A_U$  and  $A_S$  are the maximum absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Desmopressin Acetate

$C_{48}H_{68}N_{14}O_{14}S_2$   
 $C_{48}H_{68}N_{14}O_{14}S_2 \cdot xH_2O$   
 (anhydrous) 1129.27 [62288-83-9].  
 Vasopressin, 1-(3-mercaptopropionic acid)-8-D-arginine-, monoacetate (salt).  
 1-(3-Mercaptopropionic acid)-8-D-arginine-vasopressin monoacetate (salt).  
 Trihydrate 1183.31 [62357-86-2].

» Desmopressin Acetate is a synthetic octapeptide hormone having the property of antidiuresis. It is a synthetic analog of vasopressin. It contains not less than 95.0 percent and not more than

105.0 percent of desmopressin ( $C_{46}H_{64}N_{14}O_{12}S_2$ ), calculated on the anhydrous, acetic acid-free basis.

**Packaging and storage**—Preserve in tight containers, preferably of Type I glass, protected from light. Store at a temperature not exceeding 25°, preferably between 2° and 8°.

**Labeling**—Label it to state the potency, in mg, of desmopressin.

**USP Reference standards** (11)—

USP Desmopressin Acetate RS

#### Identification—

**A: Mass spectral analysis—**

**Diluent:** a mixture of water and methanol (1:1).

**Standard solution**—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in *Diluent* to obtain a solution having a known concentration of about 5  $\mu$ g per mL.

**Test solution**—Dissolve an accurately weighed quantity of Desmopressin Acetate in *Diluent* to obtain a solution having a known concentration of about 5  $\mu$ g per mL.

[NOTE—The final concentration of the *Standard solution* and the *Test solution* can be adjusted depending on the sensitivity of the mass spectrometer used in the testing.]

**Mass spectrometric system** (see *Mass Spectrometry* (736))—The LC/MS Spectrometer is equipped with an electrospray interface, positive ion mode, infusion system, and MS/MS capability.

**Procedure**—Separately infuse the *Standard solution* and the *Test solution* at about 5  $\mu$ L per minute into the mass spectrometer. Obtain optimized MS and MS/MS spectra of the peak with mass-to-charge ratio 1069. For MS spectra, the major peak with mass-to-charge ratio of 1069 should be observed. For MS/MS spectra, product ions at mass-to-charge ratios of about 641, 742, and 995 are present.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between -72° and -82°, calculated on the anhydrous, acetic acid-free basis.

**Test solution:** 5 mg per mL, in diluted acetic acid.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total aerobic microbial count does not exceed 100 cfu per g.

**Water, Method 1c** (921): not more than 6.0%.

**Amino acid content** (see *Biotechnology-Derived Articles—Amino Acid Analysis* (1052))—

NOTE—The following method is given for informational purposes; any validated amino acid analysis method can be used. The relative proportions of amino acids, however, must be met for any method used.

**Solution A**—Prepare a solution having final concentrations of 20 mM sodium acetate, 0.2% (v/v) triethylamine, and 0.3% (v/v) tetrahydrofuran.

**Solution B**—Prepare a solution containing 20% (v/v) 100 mM sodium acetate, 40% (v/v) methanol, and 40% (v/v) acetonitrile.

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Borate buffer**—Transfer 12.4 g of boric acid to a 500-mL volumetric flask, and suspend it in 300 mL of water. Add 100 mL of 1 N potassium hydroxide, and mix. Adjust with 1 N potassium hydroxide to a pH of 10.4, dilute with water to volume, and mix. Store in a closed plastic container.

**Norvaline solution**—Prepare a 4 mM solution of norvaline.

**2% DTDPA solution**—Transfer 2 g of dithiodipropionic acid to a 100-mL volumetric flask. Dissolve in and dilute with water to volume.

**Sarcosine solution**—Prepare a 4 mM solution of sarcosine.

**0.1% Phenol**—Prepare a solution containing 0.1% (w/v) phenol in 6 N hydrochloric acid.

**OPA reagent**—Prepare a solution containing 10 mg per mL each of o-phthalaldehyde and 3-mercaptopropionic acid in Borate buffer.

**FMOC reagent**—Prepare a solution containing 2.5 mg per mL of 9-fluorenylmethylchloroformate in acetonitrile.

**Calibration solution**—Prepare a mixture in which the final concentrations of amino acids are as follows: about 2.50 mM glycine; about 2.50 mM for the L-form of the amino acids lysine, histidine, arginine, aspartic acid, threonine, serine, glutamic acid, proline, alanine, valine, methionine, isoleucine, leucine, tyrosine, and phenylalanine; and about 1.25 mM L-cystine. Transfer a 1-mL aliquot of this solution to a suitable vial, and add 5  $\mu$ L each of *Norvaline solution* and *2% DTDPA solution*. Evaporate the aliquot to dryness, and add 300  $\mu$ L of *0.1% Phenol*. Mix, and alternate between purging the head space of the vial with nitrogen gas and reducing the pressure to 2 mm of mercury for a total of two purge-vacuum cycles. Purge the sample with nitrogen gas one additional time, and reduce the pressure to 1.5 mm of mercury. Seal, and heat the sample at 110° for 24 hours. Open the vial, and evaporate to dryness. Dissolve the residue in 115  $\mu$ L of *Borate buffer*, and add 5  $\mu$ L of *Sarcosine solution*. Centrifuge for 2 minutes, and transfer the supernatant to a clean vial. Remove a 6- $\mu$ L aliquot, and add 1  $\mu$ L of *OPA reagent*. Mix, and add 1  $\mu$ L of *FMOC reagent*. Mix, add 28  $\mu$ L of water, and mix again.

**Test solution**—Dissolve an accurately weighed quantity of Desmopressin Acetate in water to obtain a solution having a known concentration of about 1.00 mg per mL. Add 5  $\mu$ L each of *Norvaline solution* and *2% DTDPA solution* to a 1-mL aliquot, and prepare as directed in *Calibration solution*, beginning with "Bring the aliquot to dryness and add 300  $\mu$ L of *0.1% Phenol*."

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a thermoregulated autosampler, set at 4°, that is capable of adding and mixing derivatizing agents; a multi-wavelength detector set at 262 nm and 338 nm; and a 2.1-mm  $\times$  20-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 0.45 mL per minute. The column temperature is maintained at 40°. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	100	0	equilibration
0–17	100→40	0→60	linear gradient
17–18.10	40→0	60→100	linear gradient
18.10–24	0	100	isocratic
24–25	0→100	100→0	linear gradient
25–35	100	0	re-equilibration

Process and inject the *Calibration solution* and the *Test solution*, and record the peak responses for individual amino acid derivatives as directed for *Procedure*: the order of elution of the amino acid derivatives is aspartic acid, glutamic acid, serine, histidine, glycine, threonine, cysteine (reduced cystine), alanine, arginine, tyrosine, valine, methionine, norvaline, phenylalanine, isoleucine, leucine, lysine, and proline; the resolution,  $R$ , between the amino acid pairs histidine and glycine, alanine and arginine, and valine and methionine in the *Calibration solution* is not less than 1; and the relative standard deviation for triplicate injection of the *Calibration solution* is not greater than 15% for cysteine, lysine and proline, and not greater than 10% for all other amino acids. The peak area of the norvaline peak in the *Test*

*solution* should be not less than 80% and not greater than 120% of that found in the *Calibration solution*.

**Procedure**—Using the autosampler, separately remove equal volumes (about 6  $\mu$ L) of the *Calibration solution* and the *Test solution*, and to each add 1  $\mu$ L of *OPA reagent*. Mix, and to each add 1  $\mu$ L of *FMOC reagent*. Mix, add 28  $\mu$ L of water to each, mix again, and inject the entire volume into the chromatograph. Record the area responses for the main peaks, and identify the amino acids. Using the *Calibration solution* as a standard, express the content of each amino acid in moles. With the content for arginine set to 1, calculate the relative proportions of the amino acids: aspartic acid, glutamic acid, proline, glycine, and phenylalanine are between 0.95 and 1.05; tyrosine is between 0.7 and 1.05; cysteine is between 0.30 and 1.05; lysine, isoleucine, and leucine are absent; and not more than traces of other amino acids are found.

#### Limit of acetic acid—

**Internal standard solution**—Transfer about 16 mL of hydrochloric acid into a 1000-mL volumetric flask containing about 500 mL of water, and mix. Add about 0.5 mL of propionic acid, accurately measured, dilute with acetonitrile to volume, and mix.

**Standard solution**—Transfer about 1.049 g of acetic acid, accurately measured, to a 100-mL volumetric flask. Dilute with *Internal standard solution* to volume, and mix. Transfer 2.5 mL of the resulting solution to a 50-mL volumetric flask. Dilute with *Internal standard solution* to volume, and mix.

**Test solution**—Dissolve about 5 mg of Desmopressin Acetate, accurately weighed, in 0.5 mL of *Internal standard solution*, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.32-mm  $\times$  30-m fused silica capillary column coated with a 0.25- $\mu$ m film of phase G35. The carrier gas is helium, flowing at a rate of about 3 mL per minute, and the split flow ratio is 20:3. The column temperature is maintained at 120°, and the injection port and detector temperatures are maintained at 250°. Chromatograph six replicate injections of the *Standard solution*, and record the peak areas as directed for *Procedure*: the order of elution is acetic acid followed by propionic acid; the resolution,  $R$ , between acetic acid and propionic acid is not less than 5.0; the tailing factor for acetic acid is not more than 3.0; and the relative standard deviation of the peak area ratio of acetic acid to propionic acid is not more than 15%.

**Procedure**—Separately inject equal volumes (about 1.0  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, and measure the peak responses. Calculate the percentage of acetic acid in the portion of Desmopressin Acetate taken by the formula:

$$100(C_S/C_U)(R_U/R_S)$$

in which  $C_S$  is the concentration, in mg per mL, of acetic acid in the *Standard solution*;  $C_U$  is the concentration, in mg per mL, of desmopressin acetate in the *Test solution*; and  $R_U$  and  $R_S$  are the peak area ratios of acetic acid to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively: not less than 3% and not more than 8.0% is found.

#### Chromatographic purity—

**Mobile phase and System suitability solution**—Proceed as directed in the *Assay*.

**Standard solution**—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in *Mobile phase* to obtain a solution having a known concentration of about 1  $\mu$ g per mL.

**Test solution**—Dissolve an accurately weighed quantity of Desmopressin Acetate in *Mobile phase* to prepare a solution having a known concentration of about 200  $\mu$ g per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The flow rate is about 1.0 mL per minute, and the column is maintained at 30°. Chromatograph the *Standard solution* and the *System suitability solution*, and record the peak areas as directed for *Procedure*: the desmopressin peak elutes before the oxytocin peak; the resolution, *R*, between desmopressin and oxytocin is not less than 1.5; the tailing factor is not greater than 2.0; and the relative standard deviation of the desmopressin peak area for replicate injections of the *Standard solution* is not greater than 5.0%.

**Procedure**—Separately inject equal volumes (about 200 μL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the response for each peak, except for the main desmopressin peak in the chromatogram of the *Test solution*. Calculate the percentage of each impurity in the portion of Desmopressin Acetate taken by the formula:

$$100(C_S/C_U)(r_i/r_S)$$

in which *C<sub>S</sub>* is the concentration, in mg per mL, of USP Desmopressin Acetate RS, calculated on the anhydrous, acetic acid-free basis, in the *Standard solution*; *C<sub>U</sub>* is the concentration, in mg per mL, of Desmopressin Acetate, calculated on the anhydrous, acetic acid-free basis, in the *Test solution*; *r<sub>i</sub>* is the peak response of an individual impurity in the chromatogram obtained from the *Test solution*; and *r<sub>S</sub>* is the desmopressin peak response obtained from the *Standard solution*: not more than 0.5% of any individual impurity is found, and the sum of all impurities is less than 1.5%.

#### Assay—

**Buffer solution**—Dissolve 3.4 g of monobasic potassium phosphate and 2.0 g of sodium 1-heptanesulfonic acid in 1000 mL of water. Adjust the pH to 4.50 ± 0.05 with phosphoric acid or sodium hydroxide, as needed. Pass through a filter having a porosity of 0.45-μm.

**Mobile phase**—Mix 780 mL of *Buffer solution* with 220 mL of acetonitrile, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>). [NOTE—The retention time of desmopressin is very sensitive to the composition of the *Mobile phase*.]

**Standard preparation**—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in *Mobile phase* to obtain a solution having a known concentration of about 20 μg per mL.

**Assay preparation**—Dissolve an accurately weighed quantity of Desmopressin Acetate in *Mobile phase* to prepare a solution having a known concentration of about 20 μg per mL.

**System suitability solution**—Dissolve about 1 mg of oxytocin, accurately weighed, in a 50-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. Transfer 5.0 mL of the resulting solution and 5.0 mL of *Assay preparation* to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 220-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L1. The column temperature is maintained at 30°. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation* and the *System suitability solution*, and record the peak areas as directed for *Procedure*: the desmopressin peak elutes before the oxytocin peak; the resolution, *R*, between desmopressin and oxytocin is not less than 1.5; the tailing factor is not greater than 2.0; and the relative standard deviation of the desmopressin peak area for replicate injections is not greater than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard preparation* and the *Assay preparation*, both freshly prepared, into the chromatograph, record the chromatograms, and measure the desmopressin peak areas. Cal-

culate the percentage of C<sub>46</sub>H<sub>64</sub>N<sub>14</sub>O<sub>12</sub>S<sub>2</sub> in the portion of Desmopressin Acetate taken by the formula:

$$100(C_S/C_U)(r_U/r_S)$$

in which *C<sub>S</sub>* is the concentration, in mg per mL, of USP Desmopressin Acetate RS, calculated on the anhydrous, acetic acid-free basis, in the *Standard preparation*; *C<sub>U</sub>* is the concentration, in mg per mL, of Desmopressin Acetate, calculated on the anhydrous, acetic acid-free basis, in the *Assay preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses for desmopressin obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desmopressin Acetate Injection

» Desmopressin Acetate Injection is a sterile solution of Desmopressin Acetate in a suitable diluent. It may contain suitable preservatives. It possesses, in each mL, an activity of not less than 90.0 percent and not more than 110.0 percent of the labeled amount of desmopressin (C<sub>46</sub>H<sub>64</sub>N<sub>14</sub>O<sub>12</sub>S<sub>2</sub>), calculated on the anhydrous, acetic acid-free basis.

**Packaging and storage**—Preserve in tight containers, protected from light. Store at a temperature between 2° and 8°.

**Labeling**—Label it to state the potency, in mg, of desmopressin.

#### USP Reference standards <11>—

USP Desmopressin Acetate RS

USP Endotoxin RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 10 USP Endotoxin Units per μg of desmopressin.

**Sterility** <71>—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** <791>: between 3.5 and 6.0.

**Particulate matter** <788>: meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements for *Container Content* under *Injections* <1>.

#### Assay—

**Buffer solution**—Dissolve 4.9 g of phosphoric acid, accurately weighed, in water. Dilute with water to 1000 mL. Adjust with triethylamine to a pH of 3.5.

**Mobile phase**—Prepare a filtered and degassed mixture of *Buffer solution* and acetonitrile (83.5:16.5). Make adjustments, if necessary (see *System Suitability* under *Chromatography* <621>).

**Solution A**—Transfer 9 g of sodium chloride, accurately weighed, to a 1000-mL flask, and dissolve in and dilute with water to volume. Adjust with hydrochloric acid to a pH between 3.5 and 5.0.

**Solution B**—Transfer 9 g of sodium chloride, accurately weighed, to a 1000-mL flask, dissolve in water, and add 5 g of chlorobutanol. Dilute with water to volume, and adjust with hydrochloric acid to a pH between 3.5 and 5.0.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Desmopressin Acetate RS in water to obtain a solution having a known concentration of about 1 mg per mL. Dilute this solution with *Solution A* or *Solution B*, as di-

rected for the *Assay preparation*, to obtain a solution with a concentration of desmopressin equivalent to that in the *Assay preparation*.

**Assay preparation**—For injections at concentrations of desmopressin between 4 µg per mL and 0.1 mg per mL, use undiluted Desmopressin Acetate Injection. For injections at concentrations exceeding 0.1 mg per mL and without preservatives, dilute 1000 µL of Desmopressin Acetate Injection, accurately measured, with 10 mL of *Solution A*. For injections at concentrations exceeding 0.1 mg per mL and containing preservatives, dilute 1000 µL of Desmopressin Acetate Injection, accurately measured, with 10 mL of *Solution B*.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1.5 mL per minute. Chromatograph about 50 µL of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 1.4; and the relative standard deviation for replicate injections is not more than 5.0%.

**Procedure**—Separately inject equal volumes (about 100 µL) of the *Standard preparation* and the *Assay preparation*, both freshly prepared, into the chromatograph, and record the chromatograms for a total time of not less than 2.5 times the retention time of the desmopressin peak. Calculate the quantity of desmopressin ( $C_{46}H_{64}N_{14}O_{12}S_2$ ), in mg, in the volume of Injection taken by the formula:

$$CD(r_U / r_S)$$

in which *C* is the concentration of desmopressin, in mg per mL, in the *Standard preparation*; *D* is the dilution factor used to prepare the *Assay preparation*; and  $r_U$  and  $r_S$  are the peak responses for desmopressin obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desmopressin Nasal Spray Solution

» Desmopressin Nasal Spray Solution is a solution of Desmopressin Acetate in a suitable diluent. It is supplied in a form suitable for nasal administration and contains suitable preservatives. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of desmopressin ( $C_{46}H_{64}N_{14}O_{12}S_2$ ), calculated on the anhydrous, acetic acid-free basis.

**Packaging and storage**—Preserve in containers suitable for administering the contents by spraying into the nasal cavities in a controlled, individualized dosage. Protect from light, and store at a temperature between 2° and 8°.

**Labeling**—Label it to indicate that it is for intranasal administration only and to state the total number of discharges. Label it also to state that the dosage regulation is described in the package insert.

**USP Reference standards** <11>—  
USP Desmopressin Acetate RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—The total aerobic microbial count does not exceed 100 cfu per mL, the total combined molds and yeasts count does not exceed 10 cfu per mL, and it meets the requirements of the test for the absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**pH** <791>: between 3.5 and 6.0.

**Uniformity of unit spray weight and total number of discharges per container**—Select three Nasal Spray Solution units, and prime each spray pump as directed on the label, but not more than five times. Accurately weigh, by difference, 10 individual deliveries from each unit, weighing the first 3 discharges immediately after priming, weighing 4 discharges from the middle of each unit, and 3 close to the end of each unit. Continue to fire until the unit is empty. For each unit, determine the total number of discharges, including the number of priming deliveries, and calculate the mean weight delivered per discharge: it contains not less than the number of discharges stated on the label; the mean weight delivered per discharge is within 10% of the labeled weight per discharge; and not fewer than 9 tested discharges for each unit are between 85% and 125% of the labeled weight per discharge.

**Assay**—

*Buffer solution*, *Mobile phase*, *Solution A*, *Solution B*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Desmopressin Acetate Injection*.

*Assay preparation*, *Standard preparation*, and *Procedure*—Proceed as directed for products containing preservatives in the *Assay* under *Desmopressin Acetate Injection*.

## Desogestrel and Ethinyl Estradiol Tablets

### DEFINITION

Desogestrel and Ethinyl Estradiol Tablets contain NLT 90.0% and NMT 110.0% of the labeled amounts of desogestrel ( $C_{22}H_{30}O$ ) and ethinyl estradiol ( $C_{20}H_{24}O_2$ ).

### IDENTIFICATION

#### • A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST <201>

**Standard solution:** 0.15 mg/mL of USP Desogestrel RS and 0.03 mg/mL of USP Ethinyl Estradiol RS in ether

**Sample solution:** Transfer a number of Tablets, equivalent to 1.5 mg desogestrel and 0.3 mg ethinyl estradiol, to a suitable container, add 50 mL of water, and sonicate until the Tablets disintegrate (if necessary, remove any coating with water before sonication). Place the sample in a separatory funnel, add 25 mL of ether, and shake well to extract the actives. Using a glass pipet, transfer the ether layer to a clean beaker, and evaporate to about 10 mL.

**Chromatographic system**

(See *Chromatography* <621>, *Thin-Layer Chromatography*.)

**Mode:** TLC

**Application volume:** 30 µL

**Developing solvent system:** Chloroform and alcohol (96:4)

**Spray reagent:** Methanol and sulfuric acid (1:1)

**Analysis:** Proceed as directed in the chapter, and then air-dry. Spray the plate with the *Spray reagent*, place in an oven at 105° for about 5 min, and examine the plate.

**Acceptance criteria:** Meet the requirements

- **B.** The retention times of the major peaks of the *Sample solution* correspond to those of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** 20 mM potassium phosphate buffer, pH 6.0

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Diluent:** Acetonitrile and water (1:1)

**Standard stock solution A:** 0.3 mg/mL of USP Desogestrel RS in methanol

**Standard stock solution B:** 0.3 mg/mL of USP Ethinyl Estradiol RS in methanol

**Standard solution:** 0.6 µg/mL of USP Desogestrel RS and 0.12 µg/mL of USP Ethinyl Estradiol RS in *Diluent*, prepared by diluting appropriate aliquots of *Standard stock solution A* and *Standard stock solution B* with *Diluent*

**Sample solution:** Transfer 20 Tablets into a 200-mL volumetric flask. Add about 120 mL of *Diluent*, and shake for about 30 min. Dilute with *Diluent* to volume, and mix. Centrifuge a portion of the sample, and dilute with *Diluent* to obtain a solution nominally containing 0.6 µg/mL of desogestrel.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

#### Detectors

**Desogestrel analysis:** UV 210 nm

**Ethinyl estradiol analysis:** Spectrofluorometric detector, excitation at 285 nm and emission at 310 nm

#### Columns

**Guard:** 4.6-mm × 12.5-mm; packing L11

**Analytical:** 4.6-mm × 15-cm; packing L11

**Flow rate:** 2 mL/min

**Injection volume:** 200 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for ethinyl estradiol and desogestrel are about 0.2 and 1.0, respectively.]

#### Suitability requirements

**Tailing factor:** NMT 2.0 for both ethinyl estradiol and desogestrel

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of desogestrel ( $C_{22}H_{30}O$ ) and ethinyl estradiol ( $C_{20}H_{24}O_2$ ) in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of the relevant analyte from the *Sample solution*

$r_S$  = peak response of the relevant analyte from the *Standard solution*

$C_S$  = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of the relevant analyte in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

#### Test 1

**Medium:** 0.05% sodium lauryl sulfate with an assay content of NLT 95%; 500 mL

**Apparatus 2:** 50 rpm

**Time:** 30 min

**Buffer:** 20 mM potassium phosphate buffer, pH 6.0

**Mobile phase:** Acetonitrile and *Buffer* (1:1)

**Standard stock solution A:** 0.005 mg/mL of USP Desogestrel RS in *Medium* prepared as follows. Dissolve a sufficient quantity of USP Desogestrel RS in methanol to obtain a solution containing 0.25 mg/mL of USP Desogestrel RS. Dilute 1.0 mL of this solution with *Medium* to 50.0 mL.

**Standard stock solution B:** 0.005 mg/mL of USP Ethinyl Estradiol RS in *Medium* prepared as follows. Dissolve a sufficient quantity of USP Ethinyl Estradiol RS in methanol to obtain a solution containing 0.25 mg/mL of USP Ethinyl Estradiol RS. Dilute 1.0 mL of this solution with *Medium* to 50.0 mL.

**Standard solution:** 0.3 µg/mL of USP Desogestrel RS and 0.06 µg/mL of USP Ethinyl Estradiol RS in *Medium*, from *Standard stock solution A* and *Standard stock solution B*

**Sample solution:** Sample per *Dissolution* <711>. Centrifuge a portion of the dissolution sample, and use the clear supernatant.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

#### Detectors

**Desogestrel analysis:** UV 210 nm

**Ethinyl estradiol analysis:** Spectrofluorometric detector, excitation at 285 nm and emission at 310 nm

#### Columns

**Guard:** 4.6-mm × 12.5-mm; packing L11

**Analytical:** 4.6-mm × 15-cm; packing L11

**Flow rate:** 2 mL/min

**Injection volume:** 200 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for ethinyl estradiol and for desogestrel are about 0.2 and 1.0, respectively.]

#### Suitability requirements

**Relative standard deviation:** NMT 3.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Determine the amounts of desogestrel ( $C_{22}H_{30}O$ ) and ethinyl estradiol ( $C_{20}H_{24}O_2$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response of the relevant analyte from the *Sample solution*

$r_S$  = peak response of the relevant analyte from the *Standard solution*

$C_S$  = concentration of the appropriate USP Reference Standard in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Tablet)

$V$  = volume of medium, 500 mL

**Tolerances:** NLT 80% (Q) of each of the labeled amounts of desogestrel ( $C_{22}H_{30}O$ ) and ethinyl estradiol ( $C_{20}H_{24}O_2$ ) is dissolved.

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** 0.3% sodium lauryl sulfate; 500 mL

**Apparatus 2:** 100 rpm

**Time:** 30 min

**Analysis:** Determine the amounts of desogestrel ( $C_{22}H_{30}O$ ) and ethinyl estradiol ( $C_{20}H_{24}O_2$ ) dissolved by the chromatographic method used in *Test 1*.

**Tolerances:** NLT 80% (Q) of each of the labeled amounts of desogestrel ( $C_{22}H_{30}O$ ) and ethinyl estradiol ( $C_{20}H_{24}O_2$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements for *Content Uniformity* for both desogestrel and ethinyl estradiol

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.

- **LABELING:** When more than one *Dissolution* test is given, the labeling states the *Dissolution* test used only if *Test 1* is not used.

- **USP REFERENCE STANDARDS <11>**

USP Desogestrel RS

USP Ethinyl Estradiol RS

## Desoximetasone

$C_{22}H_{29}FO_4$  376.46

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,21-dihydroxy-16-methyl-, (11 $\beta$ ,16 $\alpha$ )-

9-Fluoro-11 $\beta$ ,21-dihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione [382-67-2].

» Desoximetasone contains not less than 97.0 percent and not more than 103.0 percent of  $C_{22}H_{29}FO_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Desoximetasone RS

**Identification**—

**A: Infrared Absorption** (197K).

**B:** Prepare a solution of it in a mixture of chloroform and alcohol (3:1) containing 10 mg per mL. Prepare a solution of USP Desoximetasone RS in the same mixture, containing 10 mg per mL. Apply separately 20  $\mu$ L of each solution to a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a saturated chamber containing a mixture of chloroform and ethyl acetate (1:1). Allow the solvent front to move 10 cm beyond the application point. After drying, examine the plate under UV light at 254 nm. Spray the dried plate with a 1 in 5 solution of *p*-toluenesulfonic acid in alcohol. The major spot from the test solution corresponds in  $R_f$  value (about 0.25) and appearance to that obtained from the Standard solution.

**Melting range** (741): between 206° and 218°, but the range between beginning and end of melting does not exceed 4°.

**Specific rotation** (781S): between +107° and +112°.

**Test solution:** 5 mg per mL, in chloroform.

**Loss on drying** (731)—Dry it at 105° to constant weight: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Heavy metals, Method II** (231): 0.002%.

**Assay**—

**Mobile phase**—Prepare a suitable filtered and degassed solution of methanol, water, and glacial acetic acid (65:35:1), such that the retention time of desoximetasone is about 6 minutes.

**Standard preparation**—On the day of use, weigh accurately about 20 mg of USP Desoximetasone RS, and dissolve in methanol to obtain 50.0 mL. Dilute 10.0 mL of this solution with a mixture of methanol and acetonitrile (1:1) to 100.0 mL.

**Assay preparation**—Weigh accurately 40 mg of Desoximetasone, dissolve in 100.0 mL of methanol, and proceed as directed for *Standard preparation*, beginning with "Dilute 10.0 mL of this solution."

**Procedure**—Using an injection loop, inject 10- $\mu$ L portions of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph equipped with an UV detector capable of monitoring absorption at 254 nm. The instrument is equipped with a 4.6-mm  $\times$  15-cm stainless steel column that contains packing L7 and is operated at a flow rate of about 1 mL per minute. In a suitable chromatogram, five replicate injections of the *Standard preparation*

show a relative standard deviation of not more than 2.0%, and the tailing factor is not more than 1.5. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_4$  in the portion of Desoximetasone taken by the formula:

$$1000C(H_U / H_S)$$

in which *C* is the concentration, in mg per mL, of USP Desoximetasone RS in the *Standard preparation*, and  $H_U$  and  $H_S$  are the peak heights of desoximetasone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desoximetasone Cream

» Desoximetasone Cream is Desoximetasone in an emollient cream base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{22}H_{29}FO_4$ .

**Packaging and storage**—Preserve in collapsible tubes, at controlled room temperature.

**USP Reference standards** (11)—

USP Desoximetasone RS

**Identification**—Evaporate 25 mL of the *Assay preparation*, prepared as directed in the *Assay*, on a steam bath just to dryness, and dissolve the residue in 2 mL of acetonitrile. This is the test solution. Prepare a Standard solution of USP Desoximetasone RS in acetonitrile containing 500  $\mu$ g per mL. Using 10  $\mu$ L instead of 20  $\mu$ L of each solution, proceed as directed in *Identification* test *B* under *Desoximetasone*, beginning with "Apply separately 20  $\mu$ L of each." The specified result is observed.

**Minimum fill** (755): meets the requirements.

**pH** (791): between 4.0 and 8.0, in a solution prepared in the following manner. Add 15 mL of boiling water to 3.5 g of the Cream in a 50-mL centrifuge tube, cap the tube, shake vigorously until the cream is uniformly dispersed, then place the tube in a steam bath until the water and oil layers separate completely. Cool, separate the layers, and determine the pH of the aqueous phase.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, water, and glacial acetic acid (65:35:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Prepare a solution of ethylparaben in methanol having a concentration of about 0.04 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Desoximetasone RS in methanol to obtain a solution having a known concentration of about 0.4 mg per mL. Pipet 5 mL of this solution into a 50-mL centrifuge tube. Add 10.0 mL of *Internal standard solution*, dilute with methanol quantitatively to 40.0 mL, and mix to obtain the *Standard preparation* having a known concentration of about 0.05 mg per mL.

**Assay preparation**—Transfer an accurately weighed amount of Cream, equivalent to about 2 mg of desoximetasone, to a 50-mL centrifuge tube, and add a few 3-mm glass beads. Add 10.0 mL of *Internal standard solution* and about 30 mL of methanol, and mix. Tightly cap the centrifuge tube, and immerse it for 10 minutes in a bath maintained at a temperature of 65°. Remove the tube from the bath, and immediately vortex at high speed for 30 seconds. Return the tube to the hot water bath for 5 minutes, remove it from the bath, and immediately vortex for 30 seconds. Repeat the procedure one more time, then cool the tube in an ice-bath held at 10° until no further

flocculent precipitation occurs. Centrifuge, and use the supernatant.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1 and 2 for ethylparaben and desoximetasone, respectively; the tailing factor for the analyte peak is not more than 2.0; the resolution, *R*, between the analyte and internal standard peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>29</sub>FO<sub>4</sub> in the portion of Cream taken by the formula:

$$40C(R_U/R_S)$$

in which *C* is the concentration, in mg per mL, of USP Desoximetasone RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desoximetasone Gel

» Desoximetasone Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>22</sub>H<sub>29</sub>FO<sub>4</sub>.

**Packaging and storage**—Preserve in collapsible tubes, at controlled room temperature.

**USP Reference standards** <11>—  
USP Desoximetasone RS

**Identification**—Transfer an amount of Gel, equivalent to 100 µg of desoximetasone, to a 15-mL centrifuge tube. Add 3 mL of acetonitrile, sonicate for approximately 1 minute, centrifuge, and transfer the clear supernatant to another 15-mL centrifuge tube. Evaporate the solution under nitrogen at a temperature between 35° and 45° to dryness. Dissolve the residue in 100 µL of methanol, using a sonicator. Streak separately the entire test solution and 100 µL of a Standard solution of USP Desoximetasone RS in methanol containing 1 mg per mL on a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture and an area of preadsorbent material on which specimens are applied. Allow the streaks to dry, and develop the chromatogram in a saturated chamber containing a mixture of acetone and chloroform (1:1). Allow the solvent front to move not less than 10 cm beyond the origin. After drying, examine the plate under UV light at 254 nm: the *R<sub>f</sub>* value of the principal spot obtained in the chromatogram of the test solution corresponds to that of the Standard solution.

**Minimum fill** <755>: meets the requirements.

**Alcohol content**—Transfer about 2.5 g of Gel, accurately weighed, to a 50-mL volumetric flask. Dissolve in methanol, dilute with methanol to volume, and mix. Determine the alcohol content of the specimen thus prepared by the *Method II—Gas-Liquid Chromatographic Method* (see *Alcohol Determination* <611>), using isopropyl alcohol as the internal standard and using methanol in place of water as the solvent: between 18.0% and 24.0% (w/w) of C<sub>2</sub>H<sub>5</sub>OH is found.

## Assay—

**Mobile phase**—Prepare a suitable filtered and degassed solution of methanol, water, and glacial acetic acid (65:35:1). Adjust the ratio, if necessary, so that the retention time of desoximetasone is about 8 minutes.

**Standard preparation**—Using an accurately weighed quantity of USP Desoximetasone RS, prepare a solution in methanol containing 0.5 mg per mL. Dilute an accurately measured volume of this solution with methanolic calcium chloride dihydrate solution (1.5 in 100) to obtain a *Standard preparation* having a known concentration of about 0.025 mg per mL.

**Assay preparation**—Transfer an accurately weighed quantity of Gel, equivalent to about 1.25 mg of desoximetasone, to a 50-mL volumetric flask, add approximately 40 mL of methanolic calcium chloride dihydrate solution (1.5 in 100), and sonicate to disperse the gel. Dilute with the same solution to volume, mix, and centrifuge. Use the clear supernatant.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>29</sub>FO<sub>4</sub> in the portion of Gel taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Desoximetasone RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses of desoximetasone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desoximetasone Ointment

» Desoximetasone Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of desoximetasone (C<sub>22</sub>H<sub>29</sub>FO<sub>4</sub>).

**Packaging and storage**—Preserve in collapsible tubes, at controlled room temperature.

**USP Reference standards** <11>—  
USP Desoximetasone RS

**Identification**—Transfer an accurately weighed quantity of Ointment, equivalent to about 5 mg of desoximetasone, to a 50-mL centrifuge tube. Add 20 mL of hexane, heat gently to 60°, and shake until the Ointment is completely dispersed. Add 8 mL of acetonitrile, insert the stopper in the tube, and shake vigorously for 5 minutes. Cool to room temperature, and centrifuge until the lower layer is clear. Transfer the lower layer to a 10-mL volumetric flask, dilute with acetonitrile to volume, and mix. Prepare a solution of USP Desoximetasone RS in acetonitrile containing 0.5 mg per mL. Separately apply 5 µL of each solution to a thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the plate in a saturated chamber containing a mixture of ethyl acetate and chloroform (4:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the

plate, and allow to air-dry. Examine under short-wavelength UV light. Spray the dried plate with a 1 in 5 solution of *p*-toluenesulfonic acid in alcohol. Heat the plate at 100° for 5 minutes, and examine under long-wavelength UV light: the  $R_F$  value and appearance (brownish yellow fluorescent spot) of the principal spot from the test solution, correspond to those of the principal spot from the Standard solution.

**Minimum fill (755):** meets the requirements.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, water, and glacial acetic acid (65:35:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Desoximetasone RS in methanol to obtain a solution having a known concentration of about 0.4 mg per mL. Quantitatively dilute 1 volume of this solution with 9 volumes of a 1:1 mixture of methanol and spectrophotometric acetonitrile that is saturated with *n*-heptane, and mix.

**Assay preparation**—Transfer an accurately weighed amount of Ointment, equivalent to about 2 mg of desoximetasone, to a 50-mL centrifuge tube. Add 20 mL of *n*-heptane that has been previously saturated with spectrophotometric acetonitrile, and heat gently with occasional shaking until the Ointment is completely dispersed. Allow to cool slightly, and extract with a 10-mL portion of spectrophotometric acetonitrile. Shake vigorously, centrifuge, remove the bottom layer of acetonitrile with a syringe and needle, and transfer to a 50-mL volumetric flask. Using the same needle and syringe, extract the desoximetasone with successive 10-mL and 8-mL portions of acetonitrile, combining all acetonitrile layers in the 50-mL flask. Dilute with methanol nearly to volume, mix, and allow the solution to reach room temperature. Dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the tailing factor for the analyte peak is not more than 2.0, the resolution,  $R$ , between the analyte and solvent peaks is not less than 5.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_4$  in the portion of Ointment taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Desoximetasone RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desoxycorticosterone Acetate

$C_{23}H_{32}O_4$  372.50

Pregn-4-ene-3,20-dione, 21-(acetyloxy)-.

11-Deoxycorticosterone acetate [56-47-3].

» Desoxycorticosterone Acetate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{23}H_{32}O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

#### USP Reference standards (11)—

USP Desoxycorticosterone Acetate RS

#### Identification—

**A: Infrared Absorption** (197K).

**B: Ultraviolet Absorption** (197U)—

*Solution:* 10  $\mu$ g per mL.

*Medium:* alcohol.

Absorptivities at 240 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 155° and 161°.

**Specific rotation** (781S): between +171° and +179°.

*Test solution:* 10 mg, undried, per mL, in dioxane.

**Loss on drying** (731)—Dry it in vacuum over silica gel for 4 hours: it loses not more than 0.5% of its weight.

#### Assay—

**Standard preparation**—Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Desoxycorticosterone Acetate RS.

**Assay preparation**—Accurately weigh about 100 mg of Desoxycorticosterone Acetate, dissolve in sufficient alcohol to make 200.0 mL, and mix. Pipet 5 mL of this solution into a 250-mL volumetric flask, add alcohol to volume, and mix. Pipet 20 mL of the resulting solution into a glass-stoppered, 50-mL conical flask.

**Procedure**—Proceed as directed for *Procedure* under *Assay for Steroids* (351). Calculate the quantity, in mg, of  $C_{23}H_{32}O_4$  in the Desoxycorticosterone Acetate taken by the formula:

$$10C(A_U / A_S).$$

## Desoxycorticosterone Acetate Injection

» Desoxycorticosterone Acetate Injection is a sterile solution of Desoxycorticosterone Acetate in vegetable oil. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of  $C_{23}H_{32}O_4$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass, protected from light.

**USP Reference standards** (11)—

USP Desoxycorticosterone Acetate RS

USP Endotoxin RS

**Identification**—Evaporate 25 mL of the *Assay preparation* from the *Assay* on a steam bath just to dryness, and dissolve the residue in 1 mL of chloroform. Using this as the test solution, proceed as directed under *Thin-Layer Chromatographic Identification Test* (201).

**Bacterial endotoxins** (85)—It contains not more than 71.4 USP Endotoxin Units per mg of desoxycorticosterone acetate.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Alcohol-isoctane and Isoctane-alcohol*—Shake equal volumes of 90 percent alcohol and isoctane in a separator for 10 to 15 minutes, and allow to separate. Withdraw the layers into separate containers, designating the lower layer as “alcohol-isoctane” and the upper layer as “isoctane-alcohol.”

*Standard preparation*—Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Desoxycorticosterone Acetate RS.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of desoxycorticosterone acetate, to a separator containing 50 mL of *Isoctane-alcohol*. Extract with six 20-mL portions of *Alcohol-isoctane*, receiving the extracts in a 250-mL volumetric flask, dilute with *Alcohol-isoctane* to volume, and mix. Pipet 10 mL of this solution into a glass-stoppered, 50-mL conical flask, evaporate on a steam bath with the aid of a gentle current of air just to dryness, and dissolve the residue in 20.0 mL of alcohol.

*Procedure*—Proceed as directed for *Procedure* under *Assay for Steroids* (351). Calculate the quantity, in mg, of  $C_{23}H_{32}O_4$  in each mL of the Injection taken by the formula:

$$0.5(C/V)(A_U/A_S)$$

in which *V* is the volume, in mL, of Injection taken.

**Desoxycorticosterone Acetate Pellets**

» Desoxycorticosterone Acetate Pellets are sterile pellets composed of Desoxycorticosterone Acetate in compressed form, without the presence of any binder, diluent, or excipient. They contain not less than 97.0 percent and not more than 103.0 percent of  $C_{23}H_{32}O_4$ .

**Packaging and storage**—Preserve in tight containers suitable for maintaining sterile contents, holding one pellet each.

**USP Reference standards** (11)—

USP Desoxycorticosterone Acetate RS

**Solubility in alcohol**—A solution of 25 mg of powdered Pellets in 1 mL of alcohol is clear and practically free from insoluble residue.

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 10 µg per mL.

*Medium:* alcohol.

Absorptivities at 240 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 155° and 161°.

**Specific rotation** (781S): between +171° and +179°.

*Test solution:* 10 mg, undried, per mL, in dioxane.

**Sterility** (71): meet the requirements.

**Weight variation**—Weigh 5 Pellets singly, and calculate the average weight. The average weight is not less than 95% and not more than 105% of the labeled weight of  $C_{23}H_{32}O_4$ , and each Pellet weighs not less than 90% and not more than 110% of the labeled weight of  $C_{23}H_{32}O_4$ .

**Assay**—

*Standard preparation*—Prepare as directed under *Assay for Steroids* (351), using USP Desoxycorticosterone Acetate RS.

*Assay preparation*—Weigh and finely powder not fewer than 10 Pellets. Weigh accurately about 100 mg of the powder, dissolve it in sufficient alcohol to make 200.0 mL, and mix. Transfer 5.0 mL of this solution to a 250-mL volumetric flask, dilute with alcohol to volume, and mix. Transfer 20.0 mL of this solution to a glass-stoppered, 50-mL conical flask.

*Procedure*—Proceed as directed for *Procedure* under *Assay for Steroids* (351). Calculate the quantity, in mg, of  $C_{23}H_{32}O_4$  in the portion of Pellets taken by the formula:

$$10C(A_U/A_S)$$

**Desoxycorticosterone Pivalate** $C_{26}H_{38}O_4$  414.58

Pregn-4-ene-3,20-dione, 21-(2,2-dimethyl-1-oxopropoxy)-11-Deoxycorticosterone pivalate [808-48-0].

» Desoxycorticosterone Pivalate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{26}H_{38}O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Desoxycorticosterone Pivalate RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 20 µg per mL.

*Medium:* methanol.

Absorptivities at 241 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Melting range** (741): between 200° and 206°.

**Specific rotation** (781S): between +155° and +163°.

*Test solution:* 10 mg per mL, in dioxane.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Assay**—

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and water (4:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Internal standard solution*—Transfer about 100 mg of desoxycorticosterone acetate to a 50-mL volumetric flask, add methanol to volume, and mix.

*Standard preparation*—Transfer about 12.5 mg of USP Desoxycorticosterone Pivalate RS, accurately weighed, to a 25-mL volumetric flask, add 20 mL of methanol, and mix. Add 2.5 mL of *Internal standard solution*, dilute with methanol to volume, and mix to obtain a solution having a known

concentration of about 0.5 mg of USP Desoxycorticosterone Pivalate RS per mL.

**Assay preparation**—Transfer about 50 mg of Desoxycorticosterone Pivalate, accurately weighed, to a 100-mL volumetric flask, add 80 mL of methanol, and mix. Add 10.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the analyte and internal standard peaks is not less than 2.0; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.5 for desoxycorticosterone acetate and 1.0 for desoxycorticosterone pivalate. Calculate the quantity, in mg, of  $C_{26}H_{38}O_4$  in the portion of Desoxycorticosterone Pivalate taken by the formula:

$$100C(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Desoxycorticosterone Pivalate RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Desoxycorticosterone Pivalate Injectable Suspension

» Desoxycorticosterone Pivalate Injectable Suspension is a sterile suspension of Desoxycorticosterone Pivalate in an aqueous medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{26}H_{38}O_4$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

**Labeling**—Label Suspension to indicate that it is for veterinary use only.

**USP Reference standards** <11>—  
USP Desoxycorticosterone Pivalate RS  
USP Endotoxin RS

**Identification**—Centrifuge a portion of Suspension, decant the supernatant, wash the residue by stirring with several successive portions of water, centrifuging and decanting each time, and finally dry the residue at 105°: the desoxycorticosterone pivalate so obtained melts between 198° and 204°, and when about 5 mg of the residue is dissolved in 2 mL of sulfuric acid, the solution is yellowish, with a greenish fluorescence. Dilute the solution with 2 mL of water: the color changes to a dark red-blue, and on further dilution with 2 mL of water it is discharged.

**Bacterial endotoxins** <85>—It contains not more than 2.78 USP Endotoxin Units per mg of desoxycorticosterone pivalate.

**pH** <791>: between 5.0 and 7.0.

**Other requirements**—It meets the requirements under *Injections* <1>.

## Assay—

*Mobile phase*, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the Assay under *Desoxycorticosterone Pivalate*.

**Assay preparation**—Using a “to contain” pipet, transfer an accurately measured volume of Suspension, equivalent to about 125 mg of desoxycorticosterone pivalate, to a 250-mL volumetric flask. Add about 200 mL of methanol, and sonicate to dissolve. Add 25.0 mL of the *Internal standard solution*, dilute with methanol to volume, and mix. Centrifuge a 20-mL portion at high speed for about 5 minutes. Filter the supernatant through a 5- $\mu$ m disk, discarding the first 5 mL of the filtrate.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Desoxycorticosterone Pivalate*. Calculate the quantity, in mg, of  $C_{26}H_{38}O_4$  in each mL of the Suspension taken by the formula:

$$250(C/V)(R_U/R_S)$$

in which  $V$  is the volume, in mL, of Suspension taken, and the other terms are as previously defined.

## Dexamethasone

$C_{22}H_{29}FO_5$  392.46  
Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17,21-trihydroxy-16-methyl-, (11 $\beta$ ,16 $\alpha$ )-  
9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione [50-02-2].

» Dexamethasone contains not less than 97.0 percent and not more than 102.0 percent of  $C_{22}H_{29}FO_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
USP Dexamethasone RS

## Identification—

**A: Infrared Absorption** <197K>.

**B: Ultraviolet Absorption** <197U>—

*Solution*: 10  $\mu$ g per mL.

*Medium*: methanol.

Absorptivities at 239 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** <781S>: between +72° and +80°.

*Test solution*: 10 mg per mL, in dioxane.

**Loss on drying** <731>—Dry it at 105° for 3 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.2% from 250 mg.

## Chromatographic purity—

*Formate buffer*—Dissolve 1.32 g of ammonium formate in 1 L of water, adjust with formic acid to a pH of 3.6, and mix.

*Mobile phase*—Prepare a filtered and degassed mixture of *Formate buffer* and acetonitrile (67:33). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Test solution**—Transfer about 180 mg of Dexamethasone, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix. Transfer about 33 mL of this solution to a 100-mL volumetric flask, dilute with *Formate buffer* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L11. The flow rate is about 1 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5000 theoretical plates.

**Procedure**—Inject a volume (about 10 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Dexamethasone taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity, and  $r_s$  is the sum of the responses of all peaks: not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

#### Assay—

**Mobile phase**—Prepare a suitable degassed solution of water and acetonitrile (about 7:3) such that at an approximate flow rate of 2 mL per minute, the retention time of Dexamethasone is about 7 minutes.

**Standard preparation**—Prepare a solution of USP Dexamethasone RS in methanol having a known concentration of about 7.5 mg per mL. Dilute an accurately measured volume of this solution with the *Mobile phase* to obtain a *Standard preparation* having a known concentration of about 0.3 mg per mL.

**Assay preparation**—Using 30 mg of Dexamethasone, proceed as directed for *Standard preparation*.

**Procedure**—Introduce equal volumes (between 15 and 30 µL) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* <621>) operated at room temperature by means of a suitable microsyringe or sampling valve, adjusting the operating parameters such that the peak obtained with the *Standard preparation* is 60% full-scale. Typically, the apparatus is fitted with a 4-mm × 25-cm column containing packing L7, is equipped with an UV detector capable of monitoring absorption at 254 nm and a suitable recorder, and is operated at about 1000 psi. Five replicate injections of the *Standard preparation* show a relative standard deviation of not more than 3.0%. Determine the peak responses, at equivalent retention times, obtained with the *Assay preparation* and the *Standard preparation*, and calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the portion of Dexamethasone taken by the formula:

$$100C(r_u / r_s)$$

in which  $C$  is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*, and  $r_u$  and  $r_s$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Topical Aerosol

» Dexamethasone Topical Aerosol is Dexamethasone in a suitable lotion base mixed with suitable propellants in a pressurized container. Dexamethasone Topical Aerosol delivers not less

than 90.0 percent and not more than 120.0 percent of the labeled amount of  $C_{22}H_{29}FO_5$ .

**Packaging and storage**—Preserve in pressurized containers, and avoid exposure to excessive heat.

**USP Reference standards** <11>—  
USP Dexamethasone RS

**Identification**—Evaporate 5 mL of the *Assay preparation*, obtained as directed in the *Assay*, on a steam bath just to dryness, and dissolve the residue in 1 mL of chloroform. Apply 100 µL of this solution and 10 µL of a solution of USP Dexamethasone RS in chloroform containing 500 µg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform and diethylamine (2:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating on a hot plate or under a heat lamp until spots appear: the  $R_f$  value of the principal spot obtained from the test solution corresponds to that obtained from the *Standard solution*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Other requirements**—It meets the requirements for *Pressure Test*, *Minimum Fill*, and *Leakage Test* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* <601>.

#### Assay—

**Standard preparation**—Prepare as directed under *Assay for Steroids* <351>, using USP Dexamethasone RS.

**Assay preparation**—Shake the Topical Aerosol container gently, and invert, immersing the valve in about 75 mL of alcohol contained in a 400-mL beaker. Actuate the valve by pushing against the bottom of the beaker. Remove the container at 15-second intervals, shake gently, and allow the container to warm to room temperature. Continue spraying until the contents of the container are exhausted. Transfer the alcohol solution to a 100-mL volumetric flask, dilute with alcohol to volume, and mix. Dilute an accurately measured volume of this solution, equivalent to about 1 mg of dexamethasone, with alcohol to 100.0 mL, and mix. Transfer 20.0 mL of this solution to a glass-stoppered, 50-mL flask.

**Procedure**—Proceed as directed for *Procedure* under *Assay for Steroids* <351>, except to allow to stand in the dark for 45 minutes. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in each container taken by the formula:

$$(10C / V)(A_u / A_s)$$

in which  $V$  is the volume, in mL, of assay solution taken for the second dilution.

## Dexamethasone Elixir

» Dexamethasone Elixir contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{22}H_{29}FO_5$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—  
USP Dexamethasone RS

**Identification**—Evaporate 9 mL of the *Assay preparation*, prepared as directed in the *Assay*, on a steam bath just to dryness, and dissolve the residue in 2 mL of a mixture of methylene chloride and methanol (1:1). Apply separately 5  $\mu$ L of this solution and 5  $\mu$ L of a solution of USP Dexamethasone RS in the mixture of methylene chloride and methanol (1:1), containing 0.5 mg per mL, to a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture (see *Chromatography* <621>). Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of chloroform, acetone, and glacial acetic acid (80:40:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots by viewing under short-wavelength UV light: the  $R_F$  value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Alcohol content**, *Method II* <611>: between 3.8% and 5.7% of  $C_2H_5OH$ , *n*-propyl alcohol being used as the internal standard.

#### Assay—

*Mobile phase*—Prepare a filtered and degassed mixture of water and acetonitrile (2:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dexamethasone RS in dilute methanol (1 in 2), and dilute quantitatively, and stepwise if necessary, with dilute methanol (1 in 2) to obtain a solution having a known concentration of about 0.1 mg per mL.

*Assay preparation*—Transfer an accurately measured volume of Elixir, freshly mixed and free from air bubbles, equivalent to about 1 mg of dexamethasone, to a 10-mL volumetric flask, dilute with water to volume, mix, and filter through a suitable membrane filter.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation for replicate injections is not more than 3.0%.

*Procedure*—Separately inject equal volumes (between 5  $\mu$ L and 25  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in each mL of the Elixir taken by the formula:

$$10(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*, *V* is the volume, in mL, of Elixir taken, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Gel

» Dexamethasone Gel contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{22}H_{29}FO_5$ .

**Packaging and storage**—Preserve in collapsible tubes. Keep tightly closed. Avoid exposure to temperatures exceeding 30°.

**USP Reference standards** <11>—  
USP Dexamethasone RS

**Identification**—Evaporate 25 mL of the *Assay preparation*, prepared as directed in the *Assay*, on a steam bath just to dryness, and dissolve the residue in 0.5 mL of chloroform. The chloroform extract responds to the *Thin-Layer Chromatographic Identification Test* <201>, 10  $\mu$ L of the chloroform extract and 10  $\mu$ L of a Standard solution containing about 500  $\mu$ g per mL of USP Dexamethasone RS being applied, and a mixture of chloroform and diethylamine (2:1) being used for development. Locate the spots on the plate by lightly spraying with dilute sulfuric acid (1 in 2) and heating.

**Minimum fill** <755>: meets the requirements.

#### Assay—

*Mobile solvent*—Dilute 100 mL of methylene chloride with isooctane to one L.

*Chromatographic columns*—Tamp a pledget of glass wool at the constriction of a glass chromatographic tube measuring about 30-  $\times$  1.5-cm, equipped with a polytetrafluoroethylene stopcock. Fill the tube about half-full with *Mobile solvent*. Mix 8 g of chromatographic siliceous earth with 8 mL of methanol and water (1:1). Transfer successive portions of the mixture to the column, emptying and adding *Mobile solvent* after each addition to pack the column. Finally drain the column to a layer of *Mobile solvent* about 1 cm above the absorbant. Pack a second tube to provide a blank and proceed as directed for *Assay preparation*, but omit the specimen.

*Standard preparation*—Prepare a solution of USP Dexamethasone RS in alcohol to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

*Assay preparation*—Accurately weigh an amount of Gel, equivalent to about 0.5 mg of Dexamethasone in a 100-mL beaker, add 1 g of chromatographic siliceous earth, and mix. Transfer the mixture to the column, wash the beaker with small portions of *Mobile solvent*, adding them to the column. Adjust the flow rate to about 2 mL per minute, discarding the eluate. Elute with four additional 25-mL portions of *Mobile solvent*, and discard. Rinse the sample beaker with two 25-mL portions of methylene chloride and transfer to the column, collecting the eluate in a suitable beaker. Elute the column with six additional 25-mL portions of methylene chloride, combining the eluates and evaporating with a gentle stream of air to dryness, dissolve the residue in alcohol, and transfer to a 50-mL volumetric flask. Wash the beaker with successive 5-mL portions of alcohol, collecting the washings in the flask, dilute with alcohol to volume, and mix. Centrifuge or filter and then pipet 10 mL of this solution, 10 mL of the *Standard preparation*, 10 mL of the column blank solution, and 10 mL of alcohol to provide a reagent blank to separate flasks. Proceed as directed under *Assay for Steroids* <351>, except to allow to stand in the dark for 45 minutes. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the portion of Gel taken by the formula:

$$(0.05C)(A_U - A_{CB} / A_S - A_{RB})$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Dexamethasone RS in the *Standard preparation*; and  $A_U$ ,  $A_{CB}$ ,  $A_S$ , and  $A_{RB}$  are the absorbances of the solutions from the *Assay preparation*, column blank preparation, *Standard preparation*, and reagent blank preparation, respectively.

## Dexamethasone Injection

» Dexamethasone Injection is a sterile solution of Dexamethasone in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in light-resistant single-dose or multiple-dose containers, preferably of Type I glass.

**Labeling**—Label it to indicate that it is for veterinary use only.

**USP Reference standards** (11)—

USP Dexamethasone RS

USP Endotoxin RS

**Identification**—

**A: Thin-Layer Chromatographic Identification Test** (201)—

**Test solution**—Transfer a quantity of Injection, equivalent to about 5 mg of dexamethasone, to a 50-mL separator, add 10 mL of water, and extract with two 20-mL portions of chloroform. Filter the lower layers through chloroform-saturated cotton into a 50-mL conical flask, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform.

**Developing solvent system:** a mixture of methylene chloride and methanol (180:16).

**Procedure**—Visualize the spots using a 1 in 5 solution of *p*-toluenesulfonic acid in a mixture of alcohol and propylene glycol (9:1), followed by heat.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 21.0 USP Endotoxin Units per mg of dexamethasone.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.0 and 5.5.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (70:30). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

**System suitability solution**—Prepare a solution in *Mobile phase* containing in each mL about 0.3 mg of USP Dexamethasone RS, 1.35 mg of benzyl alcohol, 0.27 mg of methylparaben, and 0.03 mg of propylparaben.

**Standard preparation**—Quantitatively dissolve an accurately weighed amount of USP Dexamethasone RS in methanol to obtain a stock solution having a known concentration of about 7.5 mg per mL. Transfer 4.0 mL to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 0.3 mg of USP Dexamethasone RS per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 30 mg of dexamethasone, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L7. The flow rate is about 2 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.4 for benzyl alcohol, 0.5 for methylparaben, 1.0 for dexamethasone, and 1.4 for propylparaben; and the resolution, *R*<sub>s</sub> between the neighboring peaks for benzyl alcohol and methylparaben, methylparaben and dexamethasone, and dexamethasone and propylparaben is not less than 3. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the peak responses for dexamethasone. Calculate the quantity, in mg, of dexamethasone (C<sub>22</sub>H<sub>29</sub>FO<sub>5</sub>) in each mL of the Injection taken by the formula:

$$100(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*; *V* is the volume, in mL, of Injection taken; and *r*<sub>U</sub> and *r*<sub>S</sub> are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Ophthalmic Suspension

» Dexamethasone Ophthalmic Suspension is a sterile, aqueous suspension of dexamethasone containing a suitable antimicrobial preservative. It may contain suitable buffers, stabilizers, and suspending and viscosity agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>22</sub>H<sub>29</sub>FO<sub>5</sub>.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dexamethasone RS

**Identification**—Transfer a volume of Ophthalmic Suspension, equivalent to about 2.5 mg of dexamethasone, to a test tube, add 5 mL of chloroform, and shake. Centrifuge, and apply 10 μL of the chloroform layer and 10 μL of a Standard solution of USP Dexamethasone RS in chloroform containing 500 μg per mL on a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in *Solvent A* as directed under *Single-steroid Assay* (511). Mark the solvent front, and locate the spots on the plate by spraying with a 1 in 5 solution of *p*-toluenesulfonic acid in a mixture of 9 volumes of alcohol and 1 volume of propylene glycol, and heating until spots appear. The *R*<sub>F</sub> value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Sterility** (71): meets the requirements.

**pH** (791): between 5.0 and 6.0.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (60:40). Make adjustments if necessary (see *System Suitability under Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dexamethasone RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 0.12 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Ophthalmic Suspension, freshly mixed and free from air bubbles, equivalent to about 3 mg of dexamethasone, to a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak response as directed for *Procedure*: the column efficiency determined from the analyte peak is not less than 1750 theoretical plates; the tailing factor for the analyte peak is not more than 3.0; and the relative standard deviation for replicate injections is not more than 3.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in each mL of the Ophthalmic Suspension taken by the formula:

$$25(C/V)(r_U/r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*; *V* is the volume, in mL, of Ophthalmic Suspension taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Oral Solution

» Dexamethasone Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexamethasone ( $C_{22}H_{29}FO_5$ ).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label concentrated Oral Solution to state that the term **Concentrate** is to appear apart from and immediately after the official title in prominent boldface type. Label concentrated Oral Solution also to indicate that it is to be diluted to appropriate strength with a suitable diluent prior to administration unless produced for dispensing with instructions for administration by a calibrated dropper or syringe.

**USP Reference standards** (11)—

USP Dexamethasone RS

**Thin-layer chromatographic identification test** (201)—

**Test solution**—Transfer a quantity of Oral Solution, equivalent to about 5 mg of dexamethasone, to a 50-mL separator, add 10 mL of water, and extract with two 20-mL portions of chloroform. Filter the lower layers through chloroform-saturated cotton into a 50-mL conical flask, and evaporate to dryness. Dissolve the residue in 10 mL of chloroform.

**Developing solvent system:** a mixture of methylene chloride and methanol (180:16).

**Procedure**—Visualize the spots, using a 1 in 5 solution of *p*-toluenesulfonic acid in a mixture of alcohol and propylene glycol (9:1) followed by heat.

**pH** (791): 2.7 to 4.0.

**Alcohol content, Method II** (611) (if present): between 27.0% and 33.0%.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay**—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol, water, and glacial acetic acid (55:43:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Diluting solution**—Prepare a mixture of methanol and water (1:1).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dexamethasone RS in *Diluting solution*, and dilute quantitatively, and stepwise if necessary, with *Diluting solution* to obtain a solution having a known concentration of about 0.04 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of Oral Solution, equivalent to about 4 mg of dexamethasone, to a 100-mL volumetric flask, dilute with *Diluting solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 2000 theoretical plates, the tailing factor is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg per mL, of dexamethasone ( $C_{22}H_{29}FO_5$ ) in the portion of Oral Solution taken by the formula:

$$LC/D(r_U/r_S)$$

in which *L* is the labeled quantity, in mg per mL, of dexamethasone in the Oral Solution; *D* is the concentration, in mg per mL, of dexamethasone in the *Assay preparation* on the basis of the labeled quantity and the extent of dilution; *C* is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Tablets

» Dexamethasone Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{22}H_{29}FO_5$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Dexamethasone RS

**Identification**—Evaporate 10 mL of the methanol extract of Tablets obtained as directed under *Assay preparation* in the Assay on a steam bath just to dryness, and dissolve the residue in 1 mL of chloroform. Apply 10  $\mu$ L of this solution and 20  $\mu$ L of a solution of Dexamethasone RS in chloroform containing 500  $\mu$ g per mL on a thin-layer chromatographic plate (see *System Suitability* under *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in *Solvent A* as directed under *Single-Steroid Assay* (511). Mark the solvent front, and locate the spots on the plate by visualizing under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**Dissolution** (711)—

**Medium:** dilute hydrochloric acid (1 in 100); 500 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Standard solution**—Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Dexamethasone RS.

**Procedure**—Extract a filtered aliquot of *Dissolution Medium*, equivalent to about 200  $\mu$ g of dexamethasone, with three 15-mL portions of chloroform. Evaporate the combined chloroform extracts on a steam bath just to dryness, cool, and dissolve the residue in 20 mL of alcohol. Proceed as directed for *Procedure* under *Assay for Steroids* (351), ex-

cept to allow to stand in the dark for 45 minutes. Calculate the portion, in mg, of  $C_{22}H_{29}FO_5$  dissolved by the formula:

$$10(C/V)(A_U/A_S)$$

in which  $V$  is the volume, in mL, of the aliquot extracted with chloroform.

**Tolerances**—Not less than 70% ( $Q$ ) of the labeled amount of  $C_{22}H_{29}FO_5$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—

**Standard solution**—Prepare as directed for *Standard Preparation* under *Assay for Steroids* (351), using USP Dexamethasone RS.

**Test solution**—Place 1 Tablet in a separator with 15 mL of water, and swirl to disintegrate the Tablet completely. Extract with four 10-mL portions of chloroform, filtering each portion through chloroform-washed cotton into a 50-mL volumetric flask, add chloroform to volume, and mix. Pipet a volume of this solution, equivalent to about 200  $\mu$ g of dexamethasone into a glass-stoppered, 50-mL conical flask, evaporate the chloroform on a steam bath just to dryness, cool, and dissolve the residue in 20.0 mL of alcohol. Use this where *Assay Preparation* is specified in the *Procedure*.

**Procedure**—Proceed as directed for *Procedure* under *Assay for Steroids* (351), except to allow to stand in the dark for 45 minutes. Calculate the quantity, in mg, of total steroids, as  $C_{22}H_{29}FO_5$ , in the Tablet by the formula:

$$(C/V)(A_U/A_S)$$

in which  $V$  is the volume, in mL, of the aliquot taken to prepare the *Test solution*.

#### Assay—

**Mobile solvent**—Prepare a suitable aqueous solution of acetonitrile, approximately 1 in 3, such that the retention time of dexamethasone is between 3 minutes and 6 minutes.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dexamethasone RS in dilute methanol (1 in 2) to obtain a solution having a known concentration of about 0.1 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 10 Tablets. Weigh accurately a portion of the powder, equivalent to about 5 mg of dexamethasone, transfer to a 50-mL volumetric flask, and add 30 mL of dilute methanol (1 in 2). Sonicate the flask for about 2 minutes, shake by mechanical means for 30 minutes, and dilute with the same solvent to volume. Filter a portion of the mixture through a suitable filter to obtain a clear filtrate.

**Procedure**—Introduce equal volumes (between 5  $\mu$ L and 25  $\mu$ L) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* (621)) operated at room temperature, by means of a loop injector, adjusting the specimen size and other operating parameters such that the peak obtained with the *Standard preparation* is about 0.6 full scale. Typically, the apparatus is fitted with a 4.6-mm  $\times$  30-cm column packed with packing L1 and is equipped with a UV detector capable of monitoring absorption at 254 nm and a suitable recorder. In a suitable chromatogram, the coefficient of variation for five replicate injections of a single specimen is not more than 3.0%. Measure the responses of the peaks, at identical retention times, obtained with the *Assay preparation* and the *Standard preparation*. Calculate the quantity, in mg, of  $C_{22}H_{29}FO_5$  in the portion of Tablets taken by the formula:

$$50C(r_U/r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dexamethasone RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Acetate

$C_{24}H_{31}FO_6 \cdot H_2O$  452.51

Pregna-1,4-diene-3,20-dione, 21-(acetyloxy)-9-fluoro-11,17-dihydroxy-16-methyl-, (11 $\beta$ ,16 $\alpha$ )-monohydrate.

9-Fluoro-11 $\beta$ ,17,21-trihydroxy-16 $\alpha$ -methylpregna-1,4-diene-3,20-dione 21-acetate monohydrate [55812-90-3].

Anhydrous 434.51 [1177-87-3].

» Dexamethasone Acetate contains one molecule of water of hydration or is anhydrous. It contains not less than 97.0 percent and not more than 102.0 percent of  $C_{24}H_{31}FO_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Label it to indicate whether it is hydrous or anhydrous.

**USP Reference standards** (11)—

USP Dexamethasone Acetate RS

#### Identification—

**A: Infrared Absorption** (197M).

**B: Ultraviolet Absorption** (197U)—

*Solution*: 15  $\mu$ g per mL.

*Medium*: methanol.

Absorptivities at 239 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** (781S): between +82° and +88°.

*Test solution*: 10 mg per mL, in dioxane.

**Loss on drying** (731)—Dry it in vacuum at 105° for 3 hours: the hydrous form loses between 3.5% and 4.5%, and the anhydrous form not more than 0.4%, of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): not more than 0.002%.

#### Chromatographic purity—

**Format buffer**—Dissolve 1.32 g of ammonium formate in 1 L of water, adjust with formic acid to a pH of 3.6, and mix.

**Mobile phase**—Prepare a filtered and degassed mixture of *Formate buffer* and acetonitrile (3:2). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Test solution**—Transfer about 200 mg of Dexamethasone Acetate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with acetonitrile to volume, and mix. Transfer about 40 mL of this solution to a 100-mL volumetric flask, dilute with *Formate buffer* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the column efficiency is not less than 5400 theoretical plates.

**Procedure**—Inject a volume (about 10  $\mu$ L) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Dexamethasone Acetate taken by the formula:

$$100(r_i/r_S)$$

in which  $r_i$  is the peak response for each impurity; and  $r_S$  is the sum of the responses of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found.

**Assay—**

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (550:450). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**pH 6.0 Buffer solution**—Transfer 3 mL of 1 N sodium hydroxide, 138 mL of 0.5 N potassium chloride, and 50 mL of 0.5 M monobasic potassium phosphate to a 1-L volumetric flask, dilute with water to volume, and mix.

**Diluent**—Prepare a mixture of acetonitrile and pH 6.0 Buffer solution (1:1).

**Standard preparation**—Transfer about 25 mg of USP Dexamethasone Acetate RS, accurately weighed, to a 250-mL volumetric flask. Add 100 mL of *Diluent*, and sonicate until a clear solution is obtained. Dilute with *Diluent* to volume, and mix.

**Assay preparation**—Transfer about 25 mg of Dexamethasone Acetate, accurately weighed, to a 250-mL volumetric flask. Add 100 mL of *Diluent*, and sonicate until a clear solution is obtained. Dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column containing 10-μm packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the capacity factor, *k'*, is not less than 2.0; the column efficiency is not less than 1500 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* (before and after injections of the *Assay preparation*) and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>24</sub>H<sub>31</sub>FO<sub>6</sub> in the portion of Dexamethasone Acetate taken by the formula:

$$250C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dexamethasone Acetate RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Acetate Injectable Suspension

» Dexamethasone Acetate Injectable Suspension is a sterile suspension of Dexamethasone Acetate in Water for Injection. It contains an amount of dexamethasone acetate monohydrate (C<sub>24</sub>H<sub>31</sub>FO<sub>6</sub> · H<sub>2</sub>O) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexamethasone (C<sub>22</sub>H<sub>29</sub>FO<sub>5</sub>).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** <11>—

USP Dexamethasone Acetate RS  
USP Endotoxin RS

**Identification, Infrared Absorption** <197M>—Obtain the test specimen as follows. Transfer the contents of a well-shaken container of Injectable Suspension to a fine-porosity, sintered-glass vacuum filter, filter, and wash with several 10-mL portions of water. Remove the powder from the filter

and allow to air-dry. [NOTE—Do not use heat to dry the specimen. Total or partial dehydration may occur. Use a similar undried preparation of USP Dexamethasone Acetate RS.]

**Bacterial endotoxins** <85>—It contains not more than 21.7 USP Endotoxin Units per mg of dexamethasone acetate.

**pH** <791>: between 5.0 and 7.5.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay—**

**Mobile phase, pH 6.0 Buffer solution, Diluent, and Chromatographic system**—Proceed as directed in the Assay under *Dexamethasone Acetate*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dexamethasone Acetate RS in *Diluent* to obtain a solution having a known concentration of about 0.09 mg per mL.

**Assay preparation**—Transfer an accurately measured volume of well-shaken Injectable Suspension, equivalent to about 40 mg of dexamethasone, to a 100-mL volumetric flask. Add 75 mL of *Diluent*, and sonicate until a clear solution is obtained. Dilute with *Diluent* to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Procedure**—Separately inject equal volumes (about 20 μL) of the *Standard preparation* (before and after injections of the *Assay preparation*) and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dexamethasone (C<sub>22</sub>H<sub>29</sub>FO<sub>5</sub>) in each mL of the Injectable Suspension taken by the formula:

$$(392.47 / 434.51)(500C / V)(r_U / r_S)$$

in which 392.47 and 434.51 are the molecular weights of dexamethasone and anhydrous dexamethasone acetate, respectively; *C* is the concentration, in mg per mL, of USP Dexamethasone Acetate RS in the *Standard preparation*; *V* is the volume, in mL, of Injectable Suspension taken; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Sodium Phosphate

C<sub>22</sub>H<sub>28</sub>FN<sub>2</sub>O<sub>8</sub>P 516.40

Pregna-1,4-diene-3,20-dione, 9-fluoro-11,17-dihydroxy-16-methyl-21-(phosphonoxy)-, disodium salt, (11β,16α)-9-Fluoro-11β,17,21-trihydroxy-16α-methylpregna-1,4-diene-3,20-dione 21-(dihydrogen phosphate) disodium salt [2392-39-4].

» Dexamethasone Sodium Phosphate contains not less than 97.0 percent and not more than 102.0 percent of C<sub>22</sub>H<sub>28</sub>FN<sub>2</sub>O<sub>8</sub>P, calculated on the water-free and alcohol-free basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Dexamethasone RS  
USP Dexamethasone Phosphate RS

**Identification—**

**A: pH 9 Buffer with magnesium**—Mix 3.1 g of boric acid and 500 mL of water in a 1-L volumetric flask, add 21 mL of 1 N sodium hydroxide and 10 mL of 0.1 M magnesium chloride, dilute with water to volume, and mix.

**Alkaline phosphatase solution**—Transfer  $95 \pm 5$  mg of alkaline phosphatase enzyme to a 50-mL volumetric flask, dissolve by adding pH 9 Buffer with magnesium to volume, and mix. Prepare this solution fresh daily.

**Standard solution**—Weigh 15 mg of USP Dexamethasone RS into a 5-mL volumetric flask. Dissolve in and dilute with ethyl acetate to volume. [NOTE—Sonication may be required to ensure dissolution.]

**Test solution**—Weigh 20 mg of Dexamethasone Sodium Phosphate into a 15-mL centrifuge tube. Add 5.0 mL of Alkaline phosphatase solution, shake vigorously, and allow to stand for 30 minutes. Add 5.0 mL of ethyl acetate, shake vigorously, centrifuge, and use the upper, ethyl acetate layer.

**Procedure**—Apply 10- $\mu$ L portions of the Test solution and the Standard solution to a thin-layer chromatographic plate (see Chromatography (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a mobile phase consisting of a mixture of chloroform, methanol, and water (180:15:1) to a distance of three-fourths of the length of the plate. Air-dry the plate and observe under short-wavelength UV light: the  $R_f$  value of the principal spot obtained from the Test solution corresponds to that obtained from the Standard solution.

**B:** The residue from the ignition of it meets the requirements of the tests for Phosphate (191) and for Sodium (191).

**Specific rotation** (781S): between  $+74^\circ$  and  $+82^\circ$ , calculated on the water-free and alcohol-free basis.

**Test solution:** 10 mg per mL, in water.

**pH** (791): between 7.5 and 10.5, in a solution (1 in 100).

**Water, Method I** (921)—Determine the water content. The sum of the percentages of water content, and alcohol content, determined as directed in the test for Alcohol, does not exceed 16.0%.

**Limit of phosphate ions—**

**Standard phosphate solution**—Dissolve 143.3 mg of dried monobasic potassium phosphate,  $\text{KH}_2\text{PO}_4$ , in water to make 1000.0 mL. This solution contains the equivalent of 0.10 mg of phosphate ( $\text{PO}_4$ ) in each mL.

**Phosphate reagent A**—Dissolve 5 g of ammonium molybdate in 1 N sulfuric acid to make 100 mL.

**Phosphate reagent B**—Dissolve 350 mg of *p*-methylaminophenol sulfate in 50 mL of water, add 20 g of sodium bisulfite, mix to dissolve, and dilute with water to 100 mL.

**Procedure**—Dissolve about 50 mg of Dexamethasone Sodium Phosphate, accurately weighed, in a mixture of 10 mL of water and 5 mL of 2 N sulfuric acid contained in a 25-mL volumetric flask, by warming if necessary. Add 1 mL each of Phosphate reagent A and Phosphate reagent B, dilute with water to 25 mL, mix, and allow to stand at room temperature for 30 minutes. Similarly and concomitantly, prepare a standard solution, using 5.0 mL of Standard phosphate solution instead of the 50 mg of the substance under test. Concomitantly determine the absorbances of both solutions in 1-cm cells at 730 nm, with a suitable spectrophotometer, using water as the blank. The absorbance of the test solution is not more than that of the standard solution. The limit is 1.0% of phosphate ( $\text{PO}_4$ ).

**Limit of free dexamethasone—**

**Mobile phase**—Prepare a solution containing 7.5 mL of triethylamine in 1 L of water. Adjust by the addition of phosphoric acid to a pH of 5.4. Prepare a filtered and degassed mixture of 74 parts of the resulting solution with 26 parts of methanol. Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Standard solution**—Dissolve an accurately weighed quantity of USP Dexamethasone Phosphate RS in Mobile phase to obtain a solution containing about 0.5 mg per mL. Prepare a second solution by dissolving an accurately weighed quantity of USP Dexamethasone RS in a mixture of methanol and water (1:1) to obtain a solution containing about 50  $\mu$ g per mL. Transfer 10.0 mL of the first solution and 1.0 mL of the second solution to a 100-mL volumetric flask. Dilute with Mobile phase to volume, and mix to obtain a solution having known concentrations of 50  $\mu$ g of USP Dexamethasone Phosphate RS per mL and 0.5  $\mu$ g of USP Dexamethasone RS per mL.

**Test solution**—Transfer about 50 mg of Dexamethasone Sodium Phosphate, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with Mobile phase to volume, and mix. Further dilute 5.0 mL of this solution with Mobile phase to 50.0 mL.

**System suitability solution**—Prepare a solution in Mobile phase containing in each mL 0.05 mg of USP Dexamethasone Phosphate RS and 0.02 mg of USP Dexamethasone RS.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.5-mm  $\times$  25-cm column that contains 5- $\mu$ m packing L11. The flow rate is about 1.2 mL per minute. Chromatograph the Standard solution and the System suitability solution, record the peak responses as directed for Procedure, and determine the chromatographic characteristics from chromatograms obtained from the System Suitability: the column efficiency determined from the analyte peak is not less than 900 theoretical plates; the tailing factor for the analyte peak is not more than 1.6; the resolution,  $R$ , between dexamethasone phosphate and dexamethasone is not less than 1.8; and the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu$ L) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the dexamethasone peaks. Calculate the quantity, in  $\mu$ g, of dexamethasone ( $\text{C}_{22}\text{H}_{29}\text{FO}_5$ ) in the portion of Dexamethasone Sodium Phosphate taken by the formula:

$$1000C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Dexamethasone RS in the Standard solution; and  $r_U$  and  $r_S$  are the peak responses obtained from the Test solution and the Standard solution, respectively: not more than 1.0% is found.

**Chromatographic purity—**

**Acetate buffer**—Dissolve 7 g of ammonium acetate in 1 L of water, adjust with glacial acetic acid to a pH of 4.0, and mix.

**Solution A**—Prepare a filtered and degassed mixture of methanol, water, and Acetate buffer (7:7:6). Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Solution B**—Prepare a filtered and degassed mixture of methanol and Acetate buffer (7:3). Make adjustments if necessary (see System Suitability under Chromatography (621)).

**Mobile phase**—Use variable mixtures of Solution A and Solution B as directed for Chromatographic system.

**Test solution**—Transfer about 25 mg of Dexamethasone Sodium Phosphate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with Solution A to volume, and mix.

**Chromatographic system** (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L7. The flow rate is about 1 mL per minute. The column temperature is maintained at  $40^\circ$ . The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	90	10	equilibration
0–3.5	90	10	isocratic
3.5–23.5	90→60	10→40	linear gradient
23.5–34.5	60→5	40→95	linear gradient
34.5–59.5	5	95	isocratic
59.5–60	5→90	95→10	linear gradient

Chromatograph the *Test solution*, and record the peak responses as directed for *Procedure*: the resolution between the major peak and the nearest impurity is not less than 1.0; and the relative standard deviation for replicate injections is not more than 4.0%.

**Procedure**—Separately inject equal volumes (about 15 µL) of the *Test solution* into the chromatograph, record the chromatogram, and measure the peak responses. Calculate the percentage of each impurity in the portion of Dexamethasone Sodium Phosphate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak response for each impurity; and  $r_s$  is the sum of the responses of all peaks: not more than 1.0% of any individual impurity is found, and not more than 2.0% of total impurities is found.

**Alcohol content, Method II** (611)—Proceed as directed in the chapter except to use column packing S8 and to use the following modifications.

**Internal standard solution**—Pipet 1 mL of isopropyl alcohol into a 100-mL volumetric flask, add water to volume, and mix.

**Standard stock solution**—Prepare a solution of alcohol in water (1 in 50). Determine the specific gravity at 25° (see *Specific* (841)), and obtain the percentage of C<sub>2</sub>H<sub>5</sub>OH by reference to the *Alcoholometric Table* in the section *Reference Tables*.

**Standard solution**—Into a 10-mL volumetric flask pipet 4 mL of *Standard stock solution* and 5 mL of *Internal standard solution*, add water to volume, and mix. Inject 2 µL of this solution into the gas chromatograph.

**Test solution**—Transfer about 500 mg of Dexamethasone Sodium Phosphate, accurately weighed, into a 10-mL volumetric flask. Pipet 5 mL of *Internal standard solution* into the flask, and mix to dissolve. Add water to volume, and mix. Inject 2 µL of this solution into the gas chromatograph.

**Calculation**—Calculate the percentage of alcohol in the Dexamethasone Sodium Phosphate taken by the formula:

$$4(S / W)(Z / Y)$$

in which  $S$  is the percentage of alcohol in the *Standard stock solution*;  $W$  is the weight, in g, of Dexamethasone Sodium Phosphate used in the *Test solution*; and  $Y$  and  $Z$  are the ratios of the alcohol peak heights to the internal standard peak heights for the *Standard solution* and the *Test solution*, respectively. The content of C<sub>2</sub>H<sub>5</sub>OH is not more than 8.0%.

#### Assay—

**Buffer solution**—Dissolve 7.0 g of ammonium acetate in 1 L of water, adjust with glacial acetic acid to a pH of 4.00 ± 0.05, and mix.

**Solution A**—Prepare a filtered and degassed mixture of methanol, water, and *Buffer solution* (350:350:300).

**Solution B**—Prepare a filtered and degassed mixture of methanol and *Buffer solution* (700:300).

**Mobile phase**—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dexamethasone Phosphate RS in *Solution A*

to obtain a solution having a known concentration of about 0.92 mg per mL.

**Assay preparation**—Dissolve an accurately weighed quantity of Dexamethasone Sodium Phosphate in *Solution A*, and mix to obtain a solution having a concentration of about 1.0 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The column temperature is maintained at about 40°. The flow rate is about 1.0 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	90	10	equilibration
0–3.5	90	10	isocratic
3.5–24	90→60	10→40	linear gradient
24–35	60→5	40→95	linear gradient
35–60	5	95	isocratic
60–60.1	5→90	95→10	linear gradient
60.1–65	90	10	isocratic

Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%. Chromatograph the *Assay preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between dexamethasone phosphate and the nearest impurity eluting after it is not less than 1.0.

**Procedure**—Separately inject equal volumes (about 15 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>28</sub>FN<sub>2</sub>O<sub>8</sub>P in the portion of Dexamethasone Sodium Phosphate taken by the formula:

$$(516.41 / 472.45)C(r_U / r_S)$$

in which 516.41 and 472.45 are the molecular weights of dexamethasone sodium phosphate and dexamethasone phosphate, respectively;  $C$  is the concentration, in mg per mL, of USP Dexamethasone Phosphate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Sodium Phosphate Inhalation Aerosol

» Dexamethasone Sodium Phosphate Inhalation Aerosol is a suspension, in suitable propellants and alcohol, in a pressurized container, of dexamethasone sodium phosphate (C<sub>22</sub>H<sub>28</sub>FN<sub>2</sub>O<sub>8</sub>P) equivalent to not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexamethasone phosphate (C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P).

**Packaging and storage**—Preserve in tight, pressurized containers, and avoid exposure to excessive heat.

#### USP Reference standards (11)—

USP Dexamethasone RS

**Identification**—Prepare a pH 9.0 buffer solution by dissolving 3.1 g of boric acid, 203 mg of magnesium chloride, and 860 mg of sodium hydroxide in water to make 1000 mL. Dissolve 50 mg of alkaline phosphatase enzyme in 50 mL of the pH 9.0 buffer solution, and transfer 5 mL of

the resulting solution to a glass-stoppered, 50-mL tube containing 5 mL of the *Assay preparation* prepared as directed in the *Assay*. Incubate at 37° for 45 minutes, add 25 mL of methylene chloride, and shake for 2 minutes: the methylene chloride extract so obtained responds to the *Identification* test under *Dexamethasone Sodium Phosphate Injection*, beginning with "Evaporate 15 mL of the methylene chloride extract."

**Alcohol content**, *Method II* (611): between 1.7% and 2.3% of C<sub>2</sub>H<sub>5</sub>OH.

**Delivered dose uniformity over the entire contents:** meets the requirements for *Metered-Dose Inhalers* under *Aerosols*, *Nasal Sprays*, *Metered-Dose Inhalers*, and *Dry Powder Inhalers* (601).

PROCEDURE FOR DOSE UNIFORMITY—

**Standard solution**—Transfer about 10 mg of USP Dexamethasone RS, accurately weighed, to a 10-mL volumetric flask, dilute with alcohol to volume, and mix. Transfer 1.0 mL of this solution to a 100-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix to obtain a solution having a known concentration of about 10 µg per mL.

**Test solution**—Discharge the minimum recommended dose into the sampling apparatus, and detach the inhaler as directed. Rinse the apparatus (filter and interior) with two 5.0-mL portions of 0.1 N sulfuric acid, and transfer the resulting solutions quantitatively to a 50-mL centrifuge tube containing 15 mL of methylene chloride that was previously chilled in a dry ice-acetone bath for a few minutes. Insert the stopper in the centrifuge tube, and shake cautiously, releasing the pressure occasionally. Allow the phases to separate, and equilibrate to room temperature. The aqueous phase is the *Test solution*.

**Procedure**—Transfer the *Test solution* and 10.0 mL of the *Standard solution* into separate flasks. Add 2.0 mL of 0.1 N sulfuric acid to each, and swirl to mix. Concomitantly determine the absorbances of both solutions in 1-cm cells at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, using 0.1 N sulfuric acid as the blank. Calculate the quantity, in µg, of dexamethasone phosphate (C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P) contained in the minimum dose by the formula:

$$10(472.45 / 392.47)(CN)(A_U / A_S)$$

in which 472.45 and 392.47 are the molecular weights of dexamethasone phosphate and dexamethasone, respectively; C is the concentration, in µg per mL, of USP Dexamethasone RS in the *Standard solution*; N is the number of sprays discharged to obtain the minimum recommended dose; and A<sub>U</sub> and A<sub>S</sub> are the absorbances of the solutions from the *Test solution* and the *Standard solution*, respectively.

#### Assay—

**Standard preparation**—Transfer about 40 mg of USP Dexamethasone RS, accurately weighed, to a 50-mL volumetric flask, dilute with alcohol to volume, and mix. Transfer 5.0 mL of this solution to a 500-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix to obtain a solution having a known concentration of about 8 µg per mL.

**Assay preparation**—Weigh accurately a filled Inhalation Aerosol container, and record the weight (W<sub>1</sub>). Place the container in a dry ice-acetone bath, and cool for 60 minutes. Remove the container from the bath, and carefully remove the valve with wire cutters, taking precautions to save all pieces of the valve and cap. With the aid of four 5-mL portions of 0.1 N sulfuric acid, transfer the contents of the container to a beaker previously chilled in the bath. Dry the rinsed empty container and all of its parts in an oven at 105° for 2 hours, cool, and weigh (W<sub>2</sub>). Allow the contents of the beaker to warm to room temperature. After the bulk of the propellant has evaporated, quantitatively transfer the contents of the beaker, with the aid of several mL of 0.1 N

sulfuric acid, to a 200-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix. Transfer about 20 mL of this solution to a centrifuge tube, add 10 mL of methylene chloride, shake vigorously for 1 minute, and centrifuge. Pipet 10 mL of the clear supernatant into a 100-mL volumetric flask, dilute with 0.1 N sulfuric acid to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 239 nm, with a suitable spectrophotometer, using 0.1 N sulfuric acid as the blank. Calculate the quantity, in mg, of dexamethasone phosphate (C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P) in each g of Inhalation Aerosol taken by the formula:

$$2(472.45 / 392.47)(A_U / A_S)[C / (W_1 - W_2)]$$

in which 472.45 and 392.47 are the molecular weights of dexamethasone phosphate and dexamethasone, respectively, A<sub>U</sub> and A<sub>S</sub> are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively, C is the concentration, in µg per mL, of USP Dexamethasone RS in the *Standard preparation*, and W<sub>1</sub> and W<sub>2</sub> are the weights, in g, as previously defined.

## Dexamethasone Sodium Phosphate Cream

» Dexamethasone Sodium Phosphate Cream contains an amount of dexamethasone sodium phosphate (C<sub>22</sub>H<sub>28</sub>FN<sub>2</sub>O<sub>8</sub>P) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of dexamethasone phosphate (C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P).

**Packaging and storage**—Preserve in collapsible tubes or tight containers.

**USP Reference standards** (11)—

USP Dexamethasone RS

USP Dexamethasone Phosphate RS

**Identification**—Prepare a pH 9.0 buffer solution by dissolving 3.1 g of boric acid, 203 mg of magnesium chloride, and 860 mg of sodium hydroxide in water to make 1000 mL. Dissolve 50 mg of alkaline phosphatase enzyme in 50 mL of the pH 9.0 buffer solution, and transfer 5 mL of the resulting solution to a glass-stoppered, 50-mL tube containing 5 mL of the *Assay preparation*, prepared as directed in the *Assay*. Incubate at 37° for 45 minutes, then add 25 mL of methylene chloride, and shake for 2 minutes. The methylene chloride extract so obtained responds to the *Identification* test under *Dexamethasone Sodium Phosphate Injection*, beginning with "Evaporate 15 mL of the methylene chloride extract."

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** (755): meets the requirements.

#### Assay—

**Alcohol-aqueous phosphate buffer**—Dissolve 0.29 g of dibasic sodium phosphate in 450 mL of water, add 550 mL of alcohol, and mix.

**0.05 M Phosphate buffer**—In a 1-L volumetric flask, dissolve 6.9 g of monobasic sodium phosphate in 500 mL of water, dilute with water to volume, and mix.

**Mobile phase**—Prepare a suitable degassed solution of methanol and 0.05 M Phosphate buffer (52:48) which, at ambient temperature and at a flow rate of 1.5 mL per min-

ute, gives a retention time of about 8.5 minutes for dexamethasone phosphate.

**Standard preparation**—Using an accurately weighed quantity of USP Dexamethasone Phosphate RS, prepare a solution in *Alcohol-aqueous phosphate buffer* having a known concentration of about 30 µg per mL. Prepare this solution fresh.

**Assay preparation**—Transfer an accurately weighed quantity of Cream, equivalent to about 3 mg of dexamethasone phosphate, to a 150-mL beaker. Add 65 mL of *Alcohol-aqueous phosphate buffer*, and heat just to boiling. Pour the contents of the beaker into a 125-mL separator containing 45 mL of isooctane. After shaking for 1 minute, decant the lower layer into a 100-mL volumetric flask with the aid of a glass funnel. Rinse the 150-mL beaker with two 15-mL portions of *Alcohol-aqueous phosphate buffer*, extracting the remaining isooctane in the separator with each portion and decanting the lower layer from each extraction into the 100-mL volumetric flask. Dilute with *Alcohol-aqueous phosphate buffer* to volume, and mix. Filter through a membrane filter before injecting.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 1.5%.

**Procedure**—By means of a suitable sampling valve, separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P in the portion of Cream taken by the formula:

$$0.1 C(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Dexamethasone Phosphate RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses at equivalent retention times obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Sodium Phosphate Injection

» Dexamethasone Sodium Phosphate Injection is a sterile solution of Dexamethasone Sodium Phosphate in Water for Injection. It contains not less than 90.0 percent and not more than 115.0 percent of the labeled amount of dexamethasone phosphate (C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P), present as the disodium salt.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** <11>—

USP Dexamethasone RS

USP Dexamethasone Phosphate RS

USP Endotoxin RS

**Identification**—Pipet a volume of Injection, equivalent to 10 mg of dexamethasone phosphate, into a 100-mL volumetric flask, add water to volume, and mix. Pipet 5 mL of this solution into a 125-mL separator, and wash with two 10-mL portions of water-washed methylene chloride, discarding the washings. Transfer the solution into a glass-stoppered, 50-mL tube, and add 5 mL of alkaline phosphatase

solution, prepared by dissolving 50 mg of alkaline phosphatase enzyme in 50 mL of *pH 9 Buffer with magnesium* (prepared as directed in *Identification test A* under *Dexamethasone Sodium Phosphate*). Allow to stand at 37° for 45 minutes, and extract with 25 mL of methylene chloride. Evaporate 15 mL of the methylene chloride extract on a steam bath to dryness, and dissolve the residue in 1 mL of methylene chloride. Apply 5 µL of this solution and 5 µL of a solution of USP Dexamethasone RS in methylene chloride containing 300 µg per mL to a 20- × 20-cm, thin-layer chromatographic plate (see *Chromatography* <621>) coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram in a tank completely lined with a strip of filter paper, using a solvent system consisting of a mixture of 50 parts of chloroform, 50 parts of acetone, and 1 part of water, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing tank, mark the solvent front, and allow the spots to dry. Spray the plate with dilute sulfuric acid (1 in 2), and heat at 105° until brown or black spots appear: the  $R_F$  value of the principal spot obtained from the test specimen corresponds to that obtained from the Reference Standard.

**Bacterial endotoxins** <85>—It contains not more than 31.3 USP Endotoxin Units per mg of dexamethasone phosphate.

**pH** <791>: between 7.0 and 8.5.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

**Mobile phase**—Prepare a suitable degassed solution of 0.01 M monobasic potassium phosphate in a mixture of methanol and water (1:1) which, at ambient temperature and at a flow rate of about 1.6 mL per minute, gives a retention time of about 5 minutes for dexamethasone phosphate.

**Standard preparation**—[NOTE—Prepare this solution at the time of use.] Dissolve an accurately weighed quantity of USP Dexamethasone Phosphate RS in *Mobile phase* to obtain a solution having a known concentration of about 80 µg per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 8 mg of dexamethasone phosphate, to a 100-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. Chromatograph five replicate injections of the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative standard deviation is not more than 1.5%.

**Procedure**—By means of a suitable sampling valve, separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>22</sub>H<sub>30</sub>FO<sub>8</sub>P in each mL of the Injection taken by the formula:

$$0.1(C / V)(r_U / r_S)$$

in which C is the concentration, in µg per mL, of USP Dexamethasone Phosphate RS in the *Standard preparation*, V is the volume, in mL, of Injection taken, and  $r_U$  and  $r_S$  are the peak responses at equivalent retention times obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexamethasone Sodium Phosphate Ophthalmic Ointment

» Dexamethasone Sodium Phosphate Ophthalmic Ointment is a sterile ointment containing an amount of dexamethasone sodium phosphate ( $C_{22}H_{28}FNa_2O_8P$ ) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of dexamethasone phosphate ( $C_{22}H_{30}FO_8P$ ).

**Packaging and storage**—Preserve in collapsible ophthalmic ointment tubes.

### USP Reference standards (11)—

USP Dexamethasone RS

USP Dexamethasone Phosphate RS

**Identification**—The *Assay preparation*, prepared as directed in the *Assay*, responds to the *Identification* test under *Dexamethasone Sodium Phosphate Cream*.

**Minimum fill** (755): meets the requirements.

**Sterility** (71): meets the requirements.

**Metal particles**—It meets the requirements of the test for *Metal Particles in Ophthalmic Ointments* (751).

### Assay—

*Alcohol-aqueous phosphate buffer, 0.05 M Phosphate buffer, Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dexamethasone Sodium Phosphate Cream*.

*Assay preparation*—Using an accurately weighed portion of Ophthalmic Ointment, prepare as directed in the *Assay* under *Dexamethasone Sodium Phosphate Cream*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Dexamethasone Sodium Phosphate Cream*. Calculate the quantity, in mg, of  $C_{22}H_{30}FO_8P$  in the portion of Ophthalmic Ointment taken by the formula:

$$0.1C(r_U / r_S).$$

## Dexamethasone Sodium Phosphate Ophthalmic Solution

» Dexamethasone Sodium Phosphate Ophthalmic Solution is a sterile, aqueous solution of Dexamethasone Sodium Phosphate. It contains an amount of dexamethasone sodium phosphate ( $C_{22}H_{28}FNa_2O_8P$ ) equivalent to not less than 90.0 percent and not more than 115.0 percent of the labeled amount of dexamethasone phosphate ( $C_{22}H_{30}FO_8P$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Dexamethasone RS

USP Dexamethasone Phosphate RS

**Identification**—The *Assay preparation*, prepared as directed in the *Assay*, responds to the *Identification* test under *Dexamethasone Sodium Phosphate Cream*.

**pH** (791): between 6.6 and 7.8.

**Sterility** (71): meets the requirements.

### Assay—

*Mobile phase, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dexamethasone Sodium Phosphate Injection*.

*Assay preparation*—Transfer an accurately measured volume of Ophthalmic Solution, equivalent to about 8 mg of dexamethasone phosphate, to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Dexamethasone Sodium Phosphate Injection*. Calculate the quantity, in mg, of  $C_{22}H_{30}FO_8P$  in each mL of the Ophthalmic Solution taken by the formula:

$$0.1(C / V)(r_U / r_S)$$

in which V is the volume, in mL, of Ophthalmic Solution taken.

## Dexbrompheniramine Maleate

$C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$  435.31

2-Pyridinepropanamine,  $\gamma$ -(4-bromophenyl)-*N,N*-dimethyl-, (S)-, (Z)-2-butenedioate (1:1).

(+)-2-[*p*-Bromo- $\alpha$ -[2-(dimethylamino)ethyl]benzyl]pyridine maleate (1:1) [2391-03-9].

» Dexbrompheniramine Maleate contains not less than 98.0 percent and not more than 100.5 percent of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Dexbrompheniramine Maleate RS

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 35  $\mu$ g per mL.

*Medium:* methanol.

Absorptivities at 261 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Specific rotation** (781S): between +35.0° and +38.5°.

*Test solution:* 50 mg per mL, in dimethylformamide.

**Loss on drying** (731)—Dry it at 65° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

### Related compounds—

*Test solution*—Dissolve about 200 mg of Dexbrompheniramine Maleate in 5 mL of methylene chloride, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 4-mm  $\times$  1.2-m glass column containing 3% phase G3 on support S1AB. The column temperature is maintained at about 190°, and the injection port and detector temperatures are both maintained at about 250°. The carrier gas is dry helium, flowing at a rate adjusted to obtain a retention time of 6 to 7 minutes for the main peak.

Chromatograph the *Test solution*, record the chromatogram, and determine the peak area as directed under *Procedure*: the tailing factor for the dexbrompheniramine maleate peak is not more than 1.8.

*Procedure*—Inject a volume (about 1  $\mu$ L) of the *Test solution* into the chromatograph. Record the chromatogram for a total time of not less than twice the retention time of the dexbrompheniramine peak, and measure the areas of the peaks. The total relative area of all extraneous peaks (except that of the solvent peak and maleic acid, if observed) does not exceed 2.0%.

**Assay**—Dissolve about 400 mg of Dexbrompheniramine Maleate, accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 21.77 mg of  $C_{16}H_{19}BrN_2 \cdot C_4H_4O_4$ .

## Dexbrompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution

» Dexbrompheniramine Maleate and Pseudoephedrine Sulfate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amounts of dexbrompheniramine maleate ( $C_{10}H_{15}BrN_2 \cdot C_4H_4O_4$ ) and pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ].

### USP Reference standards (11)—

USP Dexbrompheniramine Maleate RS

USP Pseudoephedrine Sulfate RS

### Identification—

**A:** The retention time of the major peak for dexbrompheniramine maleate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** The retention time of the major peak for pseudoephedrine sulfate in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** A solution of it responds to the test for *Sulfate* (191).

**D:** Transfer a volume of Oral Solution, equivalent to about 6 mg of dexbrompheniramine maleate, to a separatory funnel, add 0.5 mL of ammonium hydroxide and 5 mL of methylene chloride, shake for 1 minute, and allow the layers to separate. Use the clear, lower layer as the test solution. Prepare a Standard solution in methanol containing 1.2 mg of USP Dexbrompheniramine Maleate RS and a second Standard solution in methanol containing 9 mg of USP Pseudoephedrine Sulfate RS per mL. Separately apply 5  $\mu$ L of the test solution and each Standard solution to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the spots to dry, and develop the chromatogram in a solvent system consisting of a mixture of ethyl ether, methanol, and ammonium hydroxide (16:3:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by examination under short-wavelength UV light: the  $R_f$  values of the two principal spots obtained from the test solution correspond to those obtained from the respective Standard solutions.

### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

### Assay—

*Mobile phase*—Prepare a mixture of water, acetonitrile, methanol, and tetrahydrofuran (55:32:8:5). Transfer 0.1 mL of phosphoric acid, followed by 0.433 g of sodium lauryl sulfate, to each 100 mL of this mixture, and mix. Adjust with ammonium hydroxide to a pH of  $3.50 \pm 0.05$ , filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—The pH of the *Mobile phase* is critical, and may cause differences of 1 to 4 minutes in the retention times of the internal standard and dexbrompheniramine.]

*Internal standard solution*—Dissolve an accurately weighed quantity of naphazoline hydrochloride in *Mobile phase* to obtain a solution containing 0.5 mg per mL.

*Dexbrompheniramine standard solution*—Dissolve an accurately weighed quantity of USP Dexbrompheniramine Maleate RS in *Mobile phase* to obtain a solution having a known concentration of about 6000  $\mu$ g per mL,  $J$  being the ratio of the labeled amount, in mg, of dexbrompheniramine maleate to the labeled amount, in mg, of pseudoephedrine sulfate per mL of the Oral Solution.

*Standard preparation*—Transfer about 30 mg of USP Pseudoephedrine Sulfate RS, accurately weighed, to a 25-mL volumetric flask, add 5.0 mL each of *Dexbrompheniramine standard solution* and *Internal standard solution*, dilute with *Mobile phase* to volume, and mix to obtain a *Standard preparation* having known concentrations of about 1.2  $J$  mg of USP Dexbrompheniramine Maleate RS per mL and about 1.2 mg of USP Pseudoephedrine Sulfate RS per mL.

*Assay preparation*—Using a “to contain” pipet, transfer an accurately measured volume of Oral Solution, equivalent to about 30 mg of pseudoephedrine sulfate, to a 25-mL volumetric flask. Rinse the pipet with about 5 mL of *Mobile phase*, collecting the rinsing in the volumetric flask. Add 5.0 mL of *Internal standard solution*, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm  $\times$  30-cm column that contains packing L11. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.0 for pseudoephedrine, 1.5 for naphazoline, and 2.5 for dexbrompheniramine; the resolution,  $R$ , between the pseudoephedrine and naphazoline peaks is not less than 3; the resolution,  $R$ , between the dexbrompheniramine and naphazoline peaks is not less than 3; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantities, in mg per mL, of dexbrompheniramine maleate ( $C_{10}H_{15}BrN_2 \cdot C_4H_4O_4$ ) and pseudoephedrine sulfate [ $(C_{10}H_{15}NO)_2 \cdot H_2SO_4$ ] in the portion of Oral Solution taken by the formula:

$$25CV(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of the appropriate USP Reference Standard in the *Standard preparation*;  $V$  is the volume, in mL, of Oral Solution taken; and  $R_U$  and  $R_S$  are the ratios of the peak responses of the corresponding analyte to the internal standard obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dexchlorpheniramine Maleate

$C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  390.86

2-Pyridinepropanamine,  $\gamma$ -(4-chlorophenyl)-*N,N*-dimethyl-, (S)-, (Z)-2-butenedioate (1:1).

(+)-2-[*p*-Chloro- $\alpha$ -[2-(dimethylamino)ethyl]benzyl]pyridine maleate (1:1) [2438-32-6].

» Dexchlorpheniramine Maleate, dried at 65° for 4 hours, contains not less than 98.0 percent and not more than 100.5 percent of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Dexchlorpheniramine Maleate RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** Ultraviolet Absorption (197U)—

*Solution:* 40  $\mu$ g per mL.

*Medium:* water.

**Melting range**, Class I (741): between 110° and 115°.

**Specific rotation** (781S): between +39.5° and +43.0°.

*Test solution:* 50 mg per mL, in dimethylformamide.

**pH** (791): between 4.0 and 5.0, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 65° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.2%.

### Related compounds—

*Test solution*—Dissolve about 200 mg of Dexchlorpheniramine Maleate in 5 mL of methylene chloride, and mix.

*Chromatographic system* (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 1.2-m  $\times$  4-mm glass column containing 3% phase G3 on support S1AB. The column temperature is maintained at about 190°, and the injection port and detector temperatures are both maintained at about 250°. The carrier gas is dry helium, flowing at a rate adjusted to obtain a retention time of 4 to 5 minutes for the main peak. Chromatograph the *Test solution*, record the chromatogram, and determine the peak area as directed under *Procedure*: the tailing factor for the dexchlorpheniramine maleate peak is not more than 1.8.

*Procedure*—Inject a volume (about 1  $\mu$ L) of the *Test solution* into the chromatograph. Record the chromatogram for a total time of not less than twice the retention time of the dexchlorpheniramine peak, and measure the areas of the peaks. The total relative area of all extraneous peaks (except that of the solvent peak and maleic acid, if observed) does not exceed 2.0%.

**Assay**—Dissolve about 400 mg of Dexchlorpheniramine Maleate, previously dried and accurately weighed, in 50 mL of glacial acetic acid, add 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 19.54 mg of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ .

## Dexchlorpheniramine Maleate Oral Solution

» Dexchlorpheniramine Maleate Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dexchlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—  
USP Dexchlorpheniramine Maleate RS

### Identification—

**A:** Evaporate the remaining extract from the Assay on a steam bath to a small volume, then transfer it to a smaller, more suitable vessel, and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3-mL portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute with dimethylformamide to 15.0 mL, and mix: the optical rotation of the solution so obtained, in a 100-mm tube, after correcting for the blank, is between +0.06° and +0.11° (distinction from chlorpheniramine maleate).

**B:** Ultraviolet Absorption (197U): Assay preparation compared to Standard preparation from Assay.

**Alcohol content** (611): between 5.0% and 7.0% of  $C_2H_5OH$ .

### Assay—

*Standard preparation*—Transfer about 40 mg of USP Dexchlorpheniramine Maleate RS, accurately weighed, to a 100-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of this solution to a separator, adjust with 1 N sodium hydroxide to a pH of 11, and cool. Extract with two 50-mL portions of solvent hexane, shaking each portion for 2 minutes before separating the phases, and combining the hexane extracts in a second separator. Extract the hexane solution with two 40-mL portions of dilute hydrochloric acid (1 in 120), combine the acid extracts in a 100-mL volumetric flask, add dilute hydrochloric acid (1 in 120) to volume, and mix. Filter the solution into a glass-stoppered conical flask, discarding the first few mL of the filtrate. The concentration of USP Dexchlorpheniramine Maleate RS in the *Standard preparation* is about 40  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately measured volume of Oral Solution, equivalent to about 40 mg of dexchlorpheniramine maleate, to a 250-mL separator, using a pipet calibrated “to contain” the required volume. Rinse the pipet with small portions of water, add the rinsings to the separator, adjust with 1 N sodium hydroxide to a pH of 11, and cool. Extract with five 70-mL portions of solvent hexane, combine the hexane extracts in a 500-mL separator, and wash the hexane solution with two 10-mL portions of sodium hydroxide solution (1 in 250). Extract the combined alkaline washings with two 20-mL portions of solvent hexane, and add these extracts to the bulk of the alkali-washed hexane solution. Filter the hexane solution through a pledget of cotton that previously has been saturated with solvent hexane into a 500-mL volumetric flask, rinse the separator with portions of solvent hexane, pass the rinsings through the filter to add to volume, and mix. Transfer 50.0 mL of this solution to a separator (retain the remaining extract for *Identification* test A), and proceed as directed for *Standard preparation*, beginning with “Extract the hexane solution.”

*Procedure*—Concomitantly determine the absorbances of the *Standard preparation* and the *Assay preparation* in 1-cm cells at the wavelength of maximum absorbance at about 264 nm, using dilute hydrochloric acid (1 in 120) as the blank. Calculate the quantity, in mg, of dexchlorphenir-

amine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in each mL of the Oral Solution taken by the formula:

$$(C / V)(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Dexchlorpheniramine Maleate RS in the *Standard preparation*; V is the volume, in mL, of Oral Solution taken; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Dexchlorpheniramine Maleate Tablets

» Dexchlorpheniramine Maleate Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Dexchlorpheniramine Maleate RS

### Identification—

A: Tablets meet the requirements under *Identification—Organic Nitrogenous Bases* (181).

B: Shake a quantity of finely powdered Tablets, equivalent to about 150 mg of dexchlorpheniramine maleate, with 100 mL of 1 N acetic acid for 10 minutes, filter through a sintered-glass funnel into a suitable vessel, adjust the filtrate with sodium hydroxide solution (1 in 10) to a pH of 11, and extract the solution with six 100-mL portions of solvent hexane, filtering each hexane extract using suitable means to effect separation of the hexane layer from the aqueous layer. Concentrate the combined extracts on a steam bath to a small volume, transfer to a smaller, more suitable vessel, and evaporate just to the point where hexane vapors are no longer perceptible. Transfer the oily residue, with the aid of four 3-mL portions of dimethylformamide, to a suitable glass-stoppered graduated cylinder, dilute with dimethylformamide to 15.0 mL, mix, and centrifuge if necessary: the optical rotation of the solution so obtained, in a 100-mm tube, after correcting for the blank, is between  $+0.24^\circ$  and  $+0.35^\circ$  (*distinction from chlorpheniramine maleate*).

### Dissolution (711)—

Medium: water; 500 mL.

Apparatus 2: 50 rpm.

Time: 45 minutes.

Determine the amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  dissolved, using the following procedure.

**Internal standard solution**—Prepare a solution of Dexbrompheniramine Maleate in water having a final concentration of about 90  $\mu\text{g}$  per mL.

**Standard solution**—Dissolve an accurately weighed quantity of USP Dexchlorpheniramine Maleate RS in water, and dilute quantitatively and stepwise with water to obtain a stock solution having a known concentration of about 12.5  $\mu\text{g}$  per mL. Pipet 5 mL of this stock solution into a 50-mL centrifuge tube, add 10.0 mL of water and 1.0 mL of *Internal standard solution*, and mix. Adjust with sodium hydroxide solution (1 in 2) to a pH of  $11 \pm 0.1$ , and add 3.0 mL of chromatographic solvent hexane. Insert the stopper in the tube, shake by mechanical means for 3 minutes, centrifuge, and use the clear supernatant hexane layer.

**Test solution**—Pipet 15 mL of a portion of the solution under test into a 50-mL centrifuge tube, add 1.0 mL of *Internal standard solution*, and mix. Proceed as directed for *Standard solution*, beginning with "Adjust with sodium hydroxide solution (1 in 2)."

**Chromatographic system** (see *Chromatography* (621))—The gas chromatograph is equipped with a flame-ionization detector and a 2-mm  $\times$  1.8-m column that contains a packing consisting of 1.2 percent phase G16 and 0.5 percent potassium hydroxide on support S1AB. The carrier gas is helium maintained at a flow rate of about 60 mL per minute. The column, injector, and detector temperatures are maintained at 205°, 250°, and 250°, respectively. Chromatograph replicate injections of the *Standard solution*, and record the peak response as directed for *Procedure*: the relative retention times are about 0.7 for dexchlorpheniramine and 1.0 for dexbrompheniramine; the resolution,  $R$ , between dexchlorpheniramine and dexbrompheniramine is not less than 1.9; and the relative standard deviation is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 2  $\mu\text{L}$ ) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  dissolved by comparison of the peak response ratios.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

**Standard preparation**—Prepare as directed in the *Assay under Dexchlorpheniramine Maleate Oral Solution*. The concentration of USP Dexchlorpheniramine Maleate RS in the *Standard preparation* is about 40  $\mu\text{g}$  per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 8 mg of dexchlorpheniramine maleate, to a 250-mL separator, mix with 50 mL of water for 10 minutes, adjust with sodium hydroxide solution (1 in 10) to a pH of 11, and cool to room temperature. Extract the mixture with two 75-mL portions of solvent hexane, and combine the extracts in a second separator. Extract the solvent hexane solution with three 50-mL portions of dilute hydrochloric acid (1 in 120), combining the acid extracts in a 200-mL volumetric flask. Add dilute hydrochloric acid (1 in 120) to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Assay preparation* and the *Standard preparation* in 1-cm cells at the wavelength of maximum absorbance at about 264 nm, with a suitable spectrophotometer, using dilute hydrochloric acid (1 in 120) as the blank. Calculate the quantity, in mg, of dexchlorpheniramine maleate ( $C_{16}H_{19}ClN_2 \cdot C_4H_4O_4$ ) in the portion of Tablets taken by the formula:

$$0.2C(A_U / A_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Dexchlorpheniramine Maleate RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively.

## Dexpanthenol

$C_9H_{19}NO_4$  205.25  
Butanamide, 2,4-dihydroxy-N-(3-hydroxypropyl)-3,3-dimethyl-, (R)-;  
D-(-)-2,4-Dihydroxy-N-(3-hydroxypropyl)-3,3-dimethylbutyramide [81-13-0].

**DEFINITION**

Dexpanthenol contains NLT 98.0% and NMT 102.0% of dexpanthenol ( $C_9H_{19}NO_4$ ), calculated on the anhydrous basis.

**IDENTIFICATION**• **A. INFRARED ABSORPTION** (197F)• **B.**

**Sample solution:** 100 mg/mL of Dexpanthenol

**Analysis:** To 1 mL of the *Sample solution* add 5 mL of 1 N sodium hydroxide and 1 drop of cupric sulfate TS, and shake vigorously.

**Acceptance criteria:** A deep blue color develops.

• **C.**

**Sample solution:** 10 mg/mL of Dexpanthenol

**Analysis:** To 1 mL of the *Sample solution* add 1 mL of 1 N hydrochloric acid, and heat on a steam bath for 30 min. Cool, add 100 mg of hydroxylamine hydrochloride, and add 5 mL of 1 N sodium hydroxide. Allow to stand for 5 min, then adjust with 1 N hydrochloric acid to a pH of 2.5–3.0, and add 1 drop of ferric chloride TS.

**Acceptance criteria:** A purplish red color develops.

**ASSAY**• **PROCEDURE**

**0.1 M potassium biphthalate:** Transfer 20.42 g of potassium biphthalate into a 1000-mL volumetric flask, and add sufficient glacial acetic acid to dissolve. If necessary, warm the mixture on a steam bath to achieve complete solution, observing precautions against absorption of moisture. Cool to room temperature, and dilute with glacial acetic acid to volume.

**Sample:** 400 mg of Dexpanthenol

**Blank:** Proceed as directed in the *Analysis*, omitting the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Residual titration

**Titrant:** 0.1 N perchloric acid VS

**Back-titrant:** 0.1 M potassium biphthalate

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a 300-mL flask fitted to a reflux condenser by means of a standard-taper glass joint, add 50.0 mL of *Titrant*, and reflux for 5 h. Cool, observing precautions to prevent atmospheric moisture from entering the condenser, and rinse the condenser with glacial acetic acid, collecting the rinsings in the flask. To the flask, add 5 drops of crystal violet TS, and titrate with the *Back-titrant* to a blue-green endpoint. Perform the *Blank* determination.

Calculate the percentage of dexpanthenol ( $C_9H_{19}NO_4$ ) in the *Sample* taken:

$$\text{Result} = \{[(V_B - V_S) \times M \times F]/W\} \times 100$$

$V_B$  = *Back-titrant* volume consumed by the *Blank* (mL)

$V_S$  = *Back-titrant* volume consumed by the *Sample* (mL)

$M$  = actual molarity of the *Back-titrant* (mM/mL)

$F$  = equivalency factor, 205.3 mg/mM

$W$  = *Sample* weight (mg)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES**• **RESIDUE ON IGNITION** (281): NMT 0.1%• **LIMIT OF AMINOPROPANOL**

**Sample:** 5 g of Dexpanthenol

**Blank:** 10 mL of water

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.1 N sulfuric acid VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 10 mL of water, and add bromothymol blue TS. Titrate with the *Titrant* to a yellow endpoint. Perform the *Blank* determination. Calculate the percentage of aminopropanol in the *Sample* taken:

$$\text{Result} = \{[(V_S - V_B) \times N \times F]/W\} \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 75.11 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** NMT 1.0%

**SPECIFIC TESTS**• **OPTICAL ROTATION**, *Specific Rotation* (781S)

**Sample solution:** 50 mg/mL in water

**Acceptance criteria:** +29.0° to +31.5°

• **REFRACTIVE INDEX** (831): 1.495–1.502, at 20°• **WATER DETERMINATION**, *Method I* (921): NMT 1.0%**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers.• **USP REFERENCE STANDARDS** (11)

USP Dexpanthenol RS

**Dexpanthenol Preparation****DEFINITION**

Dexpanthenol Preparation contains NLT 94.5% and NMT 98.5% of dexpanthenol ( $C_9H_{19}NO_4$ ), and NLT 2.7% and NMT 4.2% of pantolactone, both calculated on the anhydrous basis.

**IDENTIFICATION**• **A.** The IR absorption spectrum of a thin film of Preparation exhibits maxima only at the same wavelengths as that of a similar preparation of USP Dexpanthenol RS, except that there is an additional maximum at 5.6  $\mu\text{m}$  due to pantolactone.• **B.**

**Sample solution:** 100 mg/mL of Preparation

**Analysis:** To 1 mL of the *Sample solution* add 5 mL of 1 N sodium hydroxide and 1 drop of cupric sulfate TS, and shake vigorously.

**Acceptance criteria:** A deep blue color develops.

**COMPOSITION**• **CONTENT OF DEXPANTHENOL**

**0.1 M potassium biphthalate:** Transfer 20.42 g of potassium biphthalate into a 1000-mL volumetric flask, and add sufficient glacial acetic acid to dissolve. If necessary, warm the mixture on a steam bath to achieve complete solution, observing precautions against absorption of moisture. Cool to room temperature, and dilute with glacial acetic acid to volume.

**Sample:** 400 mg of Preparation

**Blank:** Proceed as directed in the *Analysis*, omitting the *Sample*.

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Residual titration

**Titrant:** 0.1 N perchloric acid VS

**Back-titrant:** 0.1 M potassium biphthalate

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a 300-mL flask fitted to a reflux condenser by means of a standard-taper glass joint, add 50.0 mL of *Titrant*, and reflux for 5 h. Cool, observing precautions to prevent atmospheric moisture

from entering the condenser, and rinse the condenser with glacial acetic acid, collecting the rinsings in the flask. To the flask add 5 drops of crystal violet TS, and titrate with the *Back-titrant* to a blue-green endpoint. Perform the *Blank* determination. Calculate the percentage of dexpanthenol ( $C_9H_{19}NO_4$ ) in the *Sample* taken:

$$\text{Result} = \{(V_B - V_S) \times M \times F\} / W \times 100$$

$V_B$  = *Back-titrant* volume consumed by the *Blank* (mL)

$V_S$  = *Back-titrant* volume consumed by the *Sample* (mL)

$M$  = actual molarity of the *Back-titrant* (mM/mL)

$F$  = equivalency factor, 205.3 mg/mM

$W$  = weight of the *Sample* (mg)

**Acceptance criteria:** 94.5%–98.5% on the anhydrous basis

#### • CONTENT OF PANTOLACTONE

**Internal standard solution:** 100 mg/mL of 2,6-dimethylphenol in toluene

**Standard stock solution:** 10 mg/mL of USP Pantolactone RS in methylene chloride

**Standard solution:** Pipet 0.4 mL of *Standard stock solution* into a suitable small vial. Evaporate the solvent by means of a steady stream of dry air, and add 50.0  $\mu$ L of *Internal standard solution*. Add 1 mL of a mixture of pyridine, hexamethyldisilazane, and trimethylchlorosilane (9:3:1), immediately close the vial, and shake vigorously for 30 s.

**Sample solution:** Transfer 100 mg of Preparation to a suitable small vial, and proceed as directed for the *Standard solution*, beginning with "add 50.0  $\mu$ L of *Internal standard solution*".

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** GC

**Detector:** Flame ionization

**Column:** 2.0-mm  $\times$  1.8-m, packed with 5% liquid phase G2 on support S1A

**Temperature**

**Column:** 170°, isothermal

**Injector:** 180°

**Flow rate:** Using a suitable carrier gas, adjust the flow rate so that the derivatized pantolactone elutes in 4 min.

**Injection size:** 0.5  $\mu$ L

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention times of the derivatized pantolactone and derivatized internal standard are 0.75 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between the derivatized pantolactone and derivatized internal standard

**Relative standard deviation:** NMT 2.0% for the ratios of the derivatized pantolactone peak response to the derivatized internal standard peak response

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of pantolactone in the portion of Preparation taken:

$$\text{Result} = (R_U/R_S) \times (V/W) \times C_S \times 100$$

$R_U$  = internal standard ratio (peak response of derivatized pantolactone/peak response of derivatized internal standard) from the *Sample solution*

$R_S$  = internal standard ratio (peak response of derivatized pantolactone/peak response of derivatized internal standard) from the *Standard solution*

$V$  = volume of the *Standard stock solution* taken to prepare the *Standard solution*, 0.4 mL

$W$  = weight of Preparation taken to prepare the *Sample solution* (mg)

$C_S$  = concentration of USP Pantolactone RS in the *Standard stock solution* (mg/mL)

**Acceptance criteria:** 2.7%–4.2% on the anhydrous basis

#### IMPURITIES

• **RESIDUE ON IGNITION** <281>: NMT 0.1%

• **LIMIT OF AMINOPROPANOL**

**Sample:** 5 g of Preparation

**Blank:** 10 mL of water

**Titrimetric system**

(See *Titrimetry* <541>.)

**Mode:** Direct titration

**Titrant:** 0.1 N sulfuric acid VS

**Endpoint detection:** Visual

**Analysis:** Dissolve the *Sample* in 10 mL of water, and add bromothymol blue TS. Titrate with the *Titrant* to a yellow endpoint. Perform the *Blank* determination. Calculate the percentage of aminopropanol in the *Sample* taken:

$$\text{Result} = \{(V_S - V_B) \times N \times F\} / W \times 100$$

$V_S$  = *Titrant* volume consumed by the *Sample* (mL)

$V_B$  = *Titrant* volume consumed by the *Blank* (mL)

$N$  = actual normality of the *Titrant* (mEq/mL)

$F$  = equivalency factor, 75.11 mg/mEq

$W$  = *Sample* weight (mg)

**Acceptance criteria:** NMT 1.0%

#### SPECIFIC TESTS

• **OPTICAL ROTATION**, *Specific Rotation* <781S>

**Sample solution:** 50 mg/mL in water

**Acceptance criteria:** +27.5° to +30.0°

• **REFRACTIVE INDEX** <831>: 1.495–1.502, at 20°

• **WATER DETERMINATION**, *Method I* <921>: NMT 1.0%

#### ADDITIONAL REQUIREMENTS

• **PACKAGING AND STORAGE:** Preserve in tight containers.

• **USP REFERENCE STANDARDS** <11>

USP Dexpanthenol RS

USP Pantolactone RS

## Dextran 1

» Dextran 1 is a low molecular weight fraction of dextran, consisting of a mixture of isomalto-oligosaccharides. It is obtained by controlled hydrolysis and fractionation of dextrans produced by fermentation of *Leuconostoc mesenteroides* (strain NRRL B-512; CIP 78.59, or its sub-strains, for example *L. mesenteroides* B-512F; NCTC, 10817), in the presence of sucrose. It is a glucose polymer in which the linkages between glucose units are almost exclusively  $\alpha$ -1,6. Its weight-average molecular weight is about 1000.

**Packaging and storage**—Store in well-closed containers at a temperature between 4° and 30°.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** <11>—

USP Dextran 1 RS

USP Endotoxin RS

**Identification—**

**A: Infrared Absorption** (197K)—To 1 to 2 mg each of USP Dextran 1 RS and the sample add one to two drops of water, grind in an agate mortar for 1 to 2 minutes, add about 300 mg of potassium bromide, and mix to a slurry. [NOTE—Do not grind.] Dry under vacuum at 40° for 15 minutes, and if it is not dry, continue drying for another 15 minutes. Crush the residue, prepare a disk, and run the IR spectrum with a blank potassium bromide disk in the reference beam.

**B:** It meets the requirements of the test for *Molecular weight distribution and average molecular weight*.

**Absorbance** (851)—The absorbance of a 15% solution in water at 375 nm is not more than 0.12, water being used as the blank.

**Specific rotation** (781S): between +148° and +164° at 20°, for a solution in water, on the dried basis (dry at 70° under vacuum to constant weight), and corrected for the content of sodium chloride.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total aerobic microbial count does not exceed 10<sup>2</sup> cfu per g, determined by plate count; and the total combined molds and yeasts count does not exceed 10 cfu per g.

**Bacterial endotoxins** (85) (where it is labeled as intended for use in the preparation of injectables): not more than 25.0 USP Endotoxin Units per g.

**pH** (791): between 4.5 and 7.0, in a 15% solution in water.

**Loss on drying** (731)—Dry it at 100° to 105° for 5 hours: it loses not more than 5.0% of its weight.

**Heavy metals, Method II** (231): not more than 5 µg per g.

**Limit of alcohol and related impurities—**

**Test solution**—Proceed as directed for *Test solution* in the test for *Limit of alcohol and related impurities* under *Dextran 40*, except to use 5.0 g of Dextran 1.

**Standard solution, Chromatographic system, and Procedure**—Proceed as directed in the test for *Limit of alcohol and related impurities* under *Dextran 40*. The total area of peaks from impurities in the *Test solution* does not exceed the area of the *n*-propyl alcohol solution peak.

**Limit of sodium chloride**—Dissolve 5 g of Dextran 1, accurately weighed, in 100 mL of water. Add 0.2 mL of potassium chromate TS, and titrate with 0.1 N silver nitrate VS (see *Titrimetry* (541)). Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride: not more than 1.5% of sodium chloride is found.

**Limit of nitrogenous impurities** (461) (where it is labeled as intended for use in the preparation of injectables)—

**Sulfate solution**—To 1000 mL sulfuric acid add 5 g of anhydrous cupric sulfate and 500 g of potassium sulfate. Dissolve by heating, and store at 60°.

[NOTE—If storage at 60° is not possible, prepare a smaller quantity of *Sulfate solution* on the day of use, adjusting proportions accordingly.]

**Indicator**—Dilute a mixture of 20 mL of a 0.1% solution of bromocresol green in alcohol and 4 mL of methyl red TS with water to 100 mL.

**Procedure**—Transfer 0.2 g Dextran 1, accurately weighed, to a micro-Kjeldahl flask. Add 4 mL of *Sulfate solution*. Heat until the solution exhibits a clear green color and the sides of the flask are free from carbonaceous material. Cool, cautiously add 30 mL of water, mix, and transfer the solution to a steam distillation unit. Rinse the Kjeldahl flask with three 5-mL portions of water, adding the washings to the solution. Add 15 mL of 45% sodium hydroxide solution, immediately close the distillation apparatus, and start steam distillation immediately. Receive the distillate in 1 mL of *Indicator* and sufficient water to cover the end of the condensing tube. Upon completion of the distillation, remove the receiving flask, and rinse the end of the condensing tube with a small quantity of water, adding the rinse to the distillate.

Titrate the distillate with 0.010 N hydrochloric acid until the color changes from blue to reddish violet. Perform a blank determination, and make any necessary correction. The corrected volume of 0.010 N hydrochloric acid required to change the color does not exceed 0.15 mL (110 ppm of nitrogen).

**Molecular weight distribution and average molecular weight—**

**Mobile phase**—Prepare a filtered and degassed solution of sodium chloride containing 2.9 g per L.

**Calibration solution**—Prepare a solution containing about 0.45 mg of isomaltotriose (3 glucose units) and 0.60 mg of sodium chloride per mL.

**Reference solution**—Prepare a solution of USP Dextran 1 RS in *Mobile phase* containing 6.0 to 6.5 mg per mL.

**Test solution**—Prepare a solution of Dextran 1 in *Mobile phase* containing 6.0 to 6.5 mg per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a differential refractive index detector and two 10-mm × 30-cm columns in series that contain packing L54 and are maintained at 20–25°. The flow rate is 0.07 to 0.08 mL per minute, maintained constant to ±1%.

**Procedure**—Inject about 100 µL of the *Calibration solution*, record the chromatogram, and note the retention times of the peaks. Separately inject equal volumes (about 100 µL) of the *Reference solution* and *Test solution*, and record the chromatograms. Using the retention times in the chromatogram of *Calibration solution*, identify the peaks due to isomaltotriose and sodium chloride in the chromatograms of *Reference solution* and *Test solution*. Disregard the peak due to sodium chloride in *Reference solution* and *Test solution*. Calculate the weight-average molecular weight,  $M_w$ , by the formula:

$$\sum W_i M_i$$

in which  $W_i$  is the weight proportion of oligosaccharide  $i$ ; and  $M_i$  is the molecular weight of oligosaccharide  $i$ . Use the following molecular weight values for calculation:

Glucose	180
Isomaltose	342
Isomaltotriose	504
Isomaltotetraose	666
Isomaltopentaose	828
Isomaltohexaose	990
Isomaltoheptaose	1152
Isomaltooctaose	1314
Isomaltnonaose	1476
Isomaltodecaose	1638
Isomaltoundecaose	1800
Isomaltododecaose	1962
Isomaltotridecaose	2124
Isomaltotetradecaose	2286
Isomaltopentadecaose	2448
Isomaltohexadecaose	2610
Isomaltoheptadecaose	2772
Isomaltooctadecaose	2934
Isomaltnonadecaose	3096

Calculate the amounts of the fractions with fewer than 3 and with more than 9 glucose units for the *Reference solution* and the *Test solution*: the  $M_w$  and amounts of the fractions obtained for the *Reference solution* are within the values stated in the data sheet that accompanies USP Dextran 1 RS. The  $M_w$  of Dextran 1 is between 850 and 1150. The fraction with fewer than 3 units of glucose is less than 15%,

and the fraction with more than 9 units of glucose is less than 20%.

## Dextran 40

Dextrans.

Dextrans [9004-54-0].

» Dextran 40 is derived by controlled hydrolysis and fractionation of polysaccharides elaborated by the fermentative action of certain strains of *Leuconostoc mesenteroides* (NRRL, B.512 F; NCTC, 10817) on a sucrose substrate. It is a glucose polymer in which the linkages between glucose units are almost entirely of the  $\alpha$ -1:6 type. Its weight average molecular weight is in the 35,000 to 45,000 range.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

### USP Reference standards (11)—

USP Dextran 40 RS  
USP Dextran 4 Calibration RS  
USP Dextran 10 Calibration RS  
USP Dextran 40 Calibration RS  
USP Dextran 70 Calibration RS  
USP Dextran 250 Calibration RS  
USP Dextran Vo Marker RS  
USP Dextran 40 System Suitability RS  
USP Endotoxin RS

**Color of solution**—The absorbance of a solution in water (1 in 10), measured in a 4-cm cell determined at 375 nm against a water blank, is not greater than 0.20.

### Identification—

**A: Infrared Absorption** (197K).

**B:** Prepare four *Test solutions* of Dextran 40 in water, in such a manner that the concentrations are accurately known and approximately evenly distributed in the range of 2% to 0.5%. Using a capillary tube viscometer having dimensions such that the flow time of water is not less than 100 seconds, measure the flow times of water and of the *Test solution* at 20°. Calculate the viscosity numbers of each of the *Test solutions* by the formula:

$$\{\ln[(R_D)(t/t_0)]\} / C$$

in which  $R_D$  is the ratio of the density of the individual *Test solution* to that of water;  $t$  and  $t_0$  are the flow times for the *Test solution* and water, respectively; and  $C$  is the concentration, in g per mL, of Dextran 40 in the *Test solution*. Plot the viscosity numbers of each of the *Test solutions* against their respective concentrations, and draw the straight line of best fit through the points and extrapolate to zero concentration: the value of the intercept is between 18 and 23 mL per g.

**Specific rotation** (781S): between +195° and +203°.

*Test solution:* 20 mg per mL, heated, if necessary, on a water bath to dissolve.

**Bacterial endotoxins** (85) (where it is labeled as intended for use in the preparation of injectables)—When tested in Sodium Chloride Injection (1 in 10), it contains not more than 1.0 USP Endotoxin Unit per mL.

**Safety**—Inject intravenously 1.0 mL of a sterile 1 in 10 solution of 10% Dextran 40 in saline TS into each of five mice

weighing 18 to 20 g. The injection period is not less than 10 seconds and not greater than 15 seconds. If there are no deaths within 72 hours, it meets the requirements of the test. If 1 or more animals die, continue the test using 10 mice weighing  $20 \pm 0.5$  g. If all animals survive for 72 hours, the requirements of the test are met.

**pH** (791): between 4.5 and 7.0, in a solution (1 in 10).

**Loss on drying** (731)—Dry it at 105° for 5 hours: it loses not more than 7.0% of its weight.

**Sulfate** (221)—A 1.5-g portion shows no more sulfate than corresponds to 0.45 mL of 0.020 N sulfuric acid (0.03%).

**Heavy metals, Method II** (231): 5 µg per g.

**Limit of nitrogenous impurities** (where it is labeled as intended for use in the preparation of injectables)—

*Sulfate solution*—To 1000 mL of sulfuric acid add 5 g of anhydrous cupric sulfate and 500 g of potassium sulfate. Dissolve by heating, and store at 60°. [NOTE—If storage at 60° is not possible, prepare a smaller quantity of *Sulfate solution* on the day of use, adjusting the proportions accordingly.]

*Indicator*—Dilute a mixture of 20 mL of a 0.1% solution of bromocresol green in alcohol and 4 mL of methyl red TS with water to 100 mL.

*Procedure*—Transfer 0.2 g, accurately weighed, to a micro-Kjeldahl flask. Add 4 mL of *Sulfate solution*. Heat until the solution exhibits a clear green color and the sides of the flask are free from carbonaceous material. Cool, and transfer the solution to a steam distillation unit. Rinse the Kjeldahl flask three times with 5 mL of water, adding the washings to the solution. Add 15 mL of 45% sodium hydroxide solution, immediately close the distillation apparatus, and commence steam distillation without delay. Receive the distillate in 1 mL of *Indicator* in a 100-mL flask, keeping the end of the condensing tube below the liquid surface for 5 minutes and above the liquid surface for 1 minute. Upon completion of the distillation, remove the receiving flask, and rinse the end of the condensing tube with a small quantity of water, adding the rinse to the distillate. Titrate the distillate with 0.010 N hydrochloric acid until the color changes from blue to reddish violet. Perform a blank determination, and make any necessary correction. The corrected volume of 0.010 N hydrochloric acid titrated does not exceed 0.14 mL (0.01%, as N).

### Limit of alcohol and related impurities—

*Test solution*—Dissolve without heating 5.0 g in 100 mL of water, and distill the solution, collecting the first 45 mL of the distillate. Dilute the distillate with water to 50.0 mL, and mix.

*Standard solution*—To 25.0 mL of the *Test solution* add 0.5 mL of a 2.5% (w/v) solution of *n*-propyl alcohol.

*Chromatographic system*—The gas chromatograph is equipped with a flame-ionization detector and contains a 2-mm  $\times$  1.8-m column packed with support S3. The column temperature is maintained at about 160°, the injection port temperature is maintained at about 240°, and the detector is maintained at about 210°. The carrier gas is nitrogen, flowing at a rate of about 25 mL per minute. [NOTE—Injector seals may deteriorate after multiple injections of the *Standard* and *Test solutions*. Inspect the seals before making a series of injections.]

*Procedure*—Separately inject equal volumes (about 1 µL) of the *Test solution*, the *Standard solution*, and a 0.05% (w/v) solution of *n*-propyl alcohol and water, and measure the peak responses. After corrections for any impurities in the *n*-propyl alcohol solution and water, the total area of peaks from impurities in the *Test solution* does not exceed the area of the *n*-propyl alcohol solution peak.

**Antigenic impurities** (where it is labeled as intended for use in the preparation of injectables)—Prepare a sterile solution containing 100 mg per mL in Sodium Chloride Injection. At intervals of about 48 hours, inject three 0.5-mL doses into the peritoneal cavities of each of 6 guinea pigs.

At 14 days after the first intraperitoneal injection, inject 0.20 mL intravenously into each of 3 of the guinea pigs, and at 21 days treat the other 3 guinea pigs similarly. Observe the animals for 30 minutes after each intravenous injection and again 24 hours later. The animals exhibit no evidence of anaphylactoid reactions, such as coughing, bristling of hair, or respiratory distress.

#### Molecular weight distribution and weight and number average molecular weights—

**Mobile phase**—Prepare a suitable degassed and filtered solution containing 7.1 g of anhydrous sodium sulfate per L in water.

**Calibration solutions**—Separately dissolve USP Dextran 4 Calibration RS, USP Dextran 10 Calibration RS, USP Dextran 40 Calibration RS, USP Dextran 70 Calibration RS, and USP Dextran 250 Calibration RS in *Mobile phase* to obtain solutions each containing 20 mg per mL.

**Marker solution**—Prepare a solution in *Mobile phase* containing 3 mg of dextrose and 3 mg of USP Dextran V<sub>0</sub> Marker RS per mL.

**System suitability solution**—Prepare a solution of USP Dextran 40 System Suitability RS in *Mobile phase* containing 20 mg per mL.

**Test solution**—Prepare a solution of Dextran 40 in *Mobile phase* containing 20 mg per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a refractive index detector and three 7.5-mm × 30-cm columns containing packing L38, and maintained at a constant temperature. Chromatograph the *Marker solution*, and record the peak responses as directed for *Procedure*: the elution profile shows two peaks, the first due to the V<sub>0</sub> marker, the second due to dextrose. Determine the void volume, V<sub>0</sub>, of the system as the inflection point of the ascending part of the first peak. Determine the total volume, V<sub>T</sub>, of the system as the maximum of the second peak; the tailing factor, t<sub>f</sub>, of the dextrose peak is not more than 1.3; and the relative standard deviation of the ratio V<sub>0</sub>/V<sub>T</sub> is not more than 1%. Chromatograph each of the *Calibration solutions* separately, and record the peak responses as directed for *Procedure*. Divide each profile into at least 60 vertical sections of equal volume increments. (The actual number of sections is represented by the variable *a* in the equations below.) Record y<sub>i</sub>, the height above the baseline, corresponding to each value of v<sub>i</sub>, the volume eluted at that section. For each value of v<sub>i</sub>, calculate the distribution coefficient, K<sub>i</sub>, by the formula:

$$(v_i - V_0) / (V_T - V_0).$$

Find appropriate values of b<sub>1</sub>, b<sub>2</sub>, b<sub>3</sub>, b<sub>4</sub>, and b<sub>5</sub>, using a suitable method,\* that, when substituted in the equation:

$$M_i = b_5 + e^{(b_4 + b_1 K_i + b_2 K_i^2 + b_3 K_i^3)}$$

and the resulting values of M<sub>i</sub> substituted, along with their corresponding values of y<sub>i</sub>, in the equation:

$$\bar{M}_w = \frac{\sum_{i=1}^a (y_i M_i)}{\sum_{i=1}^a y_i}$$

give values of weight average molecular weight,  $\bar{M}_w$ , within 5% of the labeled values for each of the *Calibration solutions* and 180 ± 2 for dextrose. Chromatograph the *System suitability solution*, and record the peak responses as directed for

\* The Gauss-Newton method, modified by Hartley [see D. Hartley *Technometrics*, 3 (1961)], and the G. Nilsson and K. Nilsson method [see G. Nilsson and K. Nilsson *J. Chromat.*, 101, 137 (1974)] are suitable methods. A curve-fitting program capable of nonlinear regression may be used.

*Procedure*. Calculate  $\bar{M}_w$  of the total molecular weight distribution using the same method as directed for the *Calibration solutions*, but inserting the now known values of b<sub>1</sub>, b<sub>2</sub>, b<sub>3</sub>, b<sub>4</sub>, and b<sub>5</sub>. It is between 39,000 and 46,000.

Similarly, calculate  $\bar{M}_w$  of the high-fraction dextran eluted through section *n* by the formula:

$$\frac{\sum_{i=1}^n (y_i M_i)}{\sum_{i=1}^n y_i}$$

in which *n* is defined by the relations:

$$\sum_{i=1}^n y_i \leq 0.1 \left( \sum_{i=1}^a y_i \right) \text{ and } \sum_{i=1}^{n+1} y_i > 0.1 \left( \sum_{i=1}^a y_i \right)$$

It is between 111,000 and 135,000.

Similarly, calculate  $\bar{M}_w$  of the low-fraction dextran eluted in and after section *m* by the formula:

$$\frac{\sum_{i=m}^a (y_i M_i)}{\sum_{i=m}^a y_i}$$

in which *m* is defined by:

$$\sum_{i=m}^a y_i \leq 0.1 \left( \sum_{i=1}^a y_i \right) \text{ and } \sum_{i=m-1}^a y_i > 0.1 \left( \sum_{i=1}^a y_i \right).$$

It is between 6000 and 9000.

*Procedure*—Chromatograph a 50-μL volume of the *Test solution*, and record the peak responses. Calculate values of the weight average molecular weight,  $\bar{M}_w$ , of the total molecular weight distribution of the high-fraction dextran, and of the low-fraction dextran as directed for *System Suitability* under *Chromatography* <621> the values are between 35,000 and 45,000, not more than 120,000, and not less than 5,000, respectively. With the values of b<sub>1</sub>, b<sub>2</sub>, b<sub>3</sub>, b<sub>4</sub>, and b<sub>5</sub>, obtained with the *Calibration solutions* under *Chromatographic system*, calculate the number average molecular weight,  $\bar{M}_n$ , of the total molecular weight distribution of the *Test solution* by substituting the corresponding values of M<sub>i</sub>, along with their corresponding values of y<sub>i</sub>, in the equation:

$$\bar{M}_n = \frac{\sum_{i=1}^a y_i}{\sum_{i=1}^a (y_i / M_i)}$$

The number average molecular weight,  $\bar{M}_n$ , is between 16,000 and 30,000. Where Dextran 40 is labeled as intended for use in the preparation of injectables, the ratio  $\bar{M}_w / \bar{M}_n$  is in the 1.4 to 1.9 range.

## Dextran 40 in Dextrose Injection

» Dextran 40 in Dextrose Injection is a sterile solution of Dextran 40 and Dextrose in Water for Injection. It contains in each 100 mL not less than 9.0 g and not more than 11.0 g of Dextran 40 and not less than 4.1 g and not more than 5.0 g of dextrose ( $C_6H_{12}O_6$ ). It contains no bacteriostatic agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Dextrose RS

USP Endotoxin RS

**Color of solution**—Its absorbance, determined at 375 nm against a water blank, is not greater than 0.06.

**Identification**—Dilute a portion quantitatively with dextrose solution (4.5 in 100) to a concentration of about 10 mg of Dextran 40 per mL. Using a capillary tube viscometer having dimensions such that the flow time of water is not less than 100 seconds, measure the flow times of the diluted Injection and that of a dextrose solution (4.5 in 100) at 20°. Calculate the intrinsic viscosity by the formula:

$$\{\ln[(R_D)(t/t_0)]\} / C$$

in which  $R_D$  is the ratio of the density of the diluted Injection to that of the dextrose solution;  $t$  and  $t_0$  are the flow times for the diluted Injection and the dextrose solution, respectively; and  $C$  is the concentration, in g per mL, of Dextran 40 in the diluted Injection: the intrinsic viscosity is between 18 and 23 mL per g.

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration under Test for Sterility of the Product to be Examined*.

**pH** (791): between 3.0 and 7.0.

**Heavy metals, Method II** (231): 5 µg per mL.

**Limit of 5-hydroxymethylfurfural and related substances**—Dilute an accurately measured volume of Injection, equivalent to 1.0 g of  $C_6H_{12}O_6 \cdot H_2O$ , with water to 500.0 mL. Determine the absorbance of this solution in a 1-cm cell at 284 nm, using water as the blank: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements for *Injections* (1) and for *Particulate Matter in Injections* (788).

**Assay for dextrose**—

*Mobile phase*—Use filtered and degassed 0.01 N sulfuric acid.

*System suitability preparation*—Prepare a solution in water containing 5 mg each of dextrose and xylitol per mL.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextrose RS in water to obtain a solution having a known concentration of about 5 mg of dextrose monohydrate per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 250 mg of dextrose monohydrate, to a 50-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a refractive index

detector and a 7.8-mm × 30-cm column containing packing L17. The column and, if necessary, the detector are maintained at a constant temperature of about 40°, and the flow rate is about 0.6 mL per minute. Chromatograph the *System suitability preparation*, and measure the peak responses as directed for *Procedure*: the resolution,  $R$ , between the dextrose and xylitol peaks is not less than 2.5. Chromatograph the *Standard preparation* as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.5% for dextrose.

*Procedure*—Inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextrose peaks. Calculate the concentration, in g per 100 mL, of dextrose monohydrate ( $C_6H_{12}O_6 \cdot H_2O$ ) in the volume of Injection taken by the formula:

$$(198.17 / 180.16)C(r_U / r_S)$$

in which  $C$  is the concentration, in g per 100 mL, of USP Dextrose RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Assay for dextran 40**—To 25 mL of Injection add 1 drop of 5 N ammonium hydroxide, and mix. Determine the optical rotation (see *Optical Rotation* (781)), and calculate the concentration, in g per 100 mL, of Dextran 40 in the Injection taken by the formula:

$$(1 / 197.5)[(100a / l) - (52.75C_d)]$$

in which 197.5 and 52.75 represent average values for the specific rotation of Dextran 40 and dextrose, respectively;  $a$  is the observed optical rotation in degrees;  $l$  is the length, in dm, of the polarimeter tube; and  $C_d$  is the concentration, in g per 100 mL, of dextrose as determined in the *Assay for dextrose*.

## Dextran 40 in Sodium Chloride Injection

» Dextran 40 in Sodium Chloride Injection is a sterile solution of Dextran 40 and Sodium Chloride in Water for Injection. It contains in each 100 mL not less than 9.0 g and not more than 11.0 g of dextran 40; and not less than 0.81 g and not more than 0.99 g of sodium chloride. It contains no bacteriostatic agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Endotoxin RS

**Color of solution**—Its absorbance, determined at 375 nm against a water blank, is not greater than 0.05.

**Identification**—Dilute a portion of Injection quantitatively with sodium chloride solution (0.9 in 100) to a concentration of about 10 mg of Dextran 40 per mL. Using a capillary tube viscometer with a flow time for water of not less than 100 seconds, measure the flow times of the diluted Injection

and of sodium chloride solution (0.9 in 100) at 20°. Calculate the intrinsic viscosity by the formula:

$$\{\ln[(R_D)(t/t_0)]\} / C$$

in which  $R_D$  is the ratio of the density of the diluted Injection to that of the sodium chloride solution;  $t$  and  $t_0$  are the flow times for the diluted Injection and the sodium chloride solution, respectively; and  $C$  is the concentration, in g per mL, of Dextran 40 in the diluted Injection: the intrinsic viscosity is between 18 and 23 mL per g.

**Bacterial endotoxins** (85)—It contains not more than 1.0 USP Endotoxin Unit per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 3.5 and 7.0.

**Heavy metals, Method II** (231): 5 µg per mL.

**Other requirements**—It meets the requirements for *Injections* (1) and for *Particulate Matter in Injections* (788).

**Assay for sodium chloride**—Pipet a volume of Injection, equivalent to about 90 mg of chloride, into a porcelain casserole, and add 100 mL of water and 1 mL of dichlorofluorescein TS. Mix, and titrate with 0.1 N silver nitrate VS until the silver chloride flocculates and the mixture acquires a faint pink color. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

**Assay for Dextran 40**—To 25 mL of Injection add 1 drop of 5 N ammonium hydroxide, and mix. Determine the optical rotation (see *Optical Rotation* (781)), and calculate the concentration, in g per 100 mL, of dextran 40 in the volume of Injection taken by the formula:

$$100(a/l)(1/197.5)$$

in which 197.5 represents an average value for the specific rotation of dextran 40,  $a$  is the observed optical rotation, in degrees, and  $l$  is the length, in dm, of the polarimeter tube.

## Dextran 70

Dextrans.  
Dextrans.

» Dextran 70 is derived by controlled hydrolysis and fractionation of polysaccharides elaborated by the fermentative action of certain appropriate strains of *Leuconostoc mesenteroides* (NRRL, B-512F; NCTC, 10817) on a sucrose substrate. It is a glucose polymer in which the linkages between glucose units are almost entirely of the  $\alpha$ -1:6 type. Its weight average molecular weight is in the 63,000 to 77,000 range.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

**Labeling**—Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—

USP Dextran 70 RS  
USP Dextran 4 Calibration RS  
USP Dextran 10 Calibration RS  
USP Dextran 40 Calibration RS  
USP Dextran 70 Calibration RS  
USP Dextran 250 Calibration RS  
USP Dextran Vo Marker RS

USP Dextran 70 System Suitability RS  
USP Endotoxin RS

**Color of solution**—The absorbance of a solution in water (6 in 100), measured in a 4-cm cell determined at 375 nm against a water blank, is not greater than 0.15.

**Identification**—

**A: Infrared Absorption** (197K).

**B:** Proceed as directed under *Dextran 40*, except to use Dextran 70 to prepare the *Test solutions*: the value of the results at the intercept is between 24 and 29 mL per g.

**Specific rotation** (781S): between +195° and +203°.

*Test solution:* 20 mg per mL, heated, if necessary, on a water bath to dissolve.

**Bacterial endotoxins** (85) (where it is labeled as intended for use in the preparation of injectables)—When tested in *Sodium Chloride Injection* (0.6 in 10), it contains not more than 0.5 USP Endotoxin Unit per mL.

**Safety**—Inject intravenously 1.0 mL of a sterile solution of 6% Dextran 70 in saline TS into each of five mice weighing 18 to 20 g. The injection period is not less than 10 seconds and not greater than 15 seconds. If there are no deaths within 72 hours, it meets the requirements of the test. If 1 or more animals die, continue the test using 10 mice weighing  $20 \pm 0.5$  g. If all animals survive for 72 hours, the requirements of the test are met.

**pH** (791): between 4.5 and 7.0, in a solution (6 in 100).

**Loss on drying** (731)—Dry it at 105° for 5 hours: it loses not more than 7.0% of its weight.

**Sulfate** (221)—A 1.5-g portion shows no more sulfate than corresponds to 0.45 mL of 0.020 N sulfuric acid (0.03%).

**Heavy metals, Method II** (231): 5 µg per g.

**Limit of nitrogenous impurities** (where it is labeled as intended for use in the preparation of injectables)—

*Sulfate solution and Indicator*—Proceed as directed under *Dextran 40*.

*Procedure*—Proceed as directed under *Dextran 40*, except to use 0.2 g of Dextran 70.

**Limit of alcohol and related impurities**—

*Test solution*—Proceed as directed under *Dextran 40*, except to use 5.0 g of Dextran 70.

*Standard solution, Chromatographic system, and Procedure*—Proceed as directed under *Dextran 40*.

**Antigenic impurities** (where it is labeled as intended for use in the preparation of injectables)—Prepare a sterile solution containing 60 mg per mL of Dextran 70 in *Sodium Chloride Injection*, and proceed as directed under *Dextran 40* beginning with "At intervals of about 48 hours."

**Molecular weight distribution and weight and number average molecular weights**—

*Mobile phase, Calibration solutions, and Marker solution*—Proceed as directed under *Dextran 40*.

*System suitability solution*—Prepare a solution of USP Dextran 70 System Suitability RS in *Mobile phase* containing 20 mg per mL.

*Test solution*—Prepare a solution of Dextran 70 in *Mobile phase* containing 20 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—Proceed as directed under *Dextran 40*:  $M_w$  for the total molecular weight distribution is between 65,000 and 74,000;  $M_w$  for the high-fraction dextran is between 180,000 and 240,000; and  $M_w$  for the low-fraction dextran is between 7,000 and 11,000.

*Procedure*—Chromatograph a 50-µL volume of the *Test solution*, and record the peak responses. Calculate values of  $M_w$  of the total molecular weight distribution, of the high-fraction dextran, and of the low-fraction dextran as directed for the *System suitability solution* under *Chromatographic system*. The  $M_w$  values are between 63,000 and 77,000, not more than 195,000, and not less than 13,000, respectively.

With the values of  $b_1$ ,  $b_2$ ,  $b_3$ ,  $b_4$ , and  $b_5$ , obtained with the *Calibration solutions* under *Chromatographic system*, calculate the number average molecular weight,  $\bar{M}_n$ , of the total molecular weight distribution of the *Test solution* by substituting the corresponding values of  $M_i$ , along with their corresponding values of  $y_i$ , in the equation:

$$\bar{M}_n = \sum_{i=1}^a y_i / \sum_{i=1}^a (y_i / M_i)$$

The number average molecular weight,  $\bar{M}_n$ , is between 34,000 and 48,000. Where Dextran 70 is labeled as intended for use in the preparation of injectables, the ratio  $\bar{M}_w / \bar{M}_n$  is in the 1.4 to 1.9 range.

## Dextran 70 in Dextrose Injection

» Dextran 70 in Dextrose Injection is a sterile solution of Dextran 70 and Dextrose in Water for Injection. It contains in each 100 mL not less than 5.4 g and not more than 6.6 g of dextran 70 and not less than 4.1 g and not more than 5.0 g of dextrose ( $C_6H_{12}O_6$ ). It contains no bacteriostatic agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Dextrose RS

USP Endotoxin RS

**Color of solution**—Its absorbance, determined at 375 nm against a water blank, is not greater than 0.05.

**Identification**—Dilute a portion quantitatively with dextrose solution (4.5 in 100) to a concentration of about 10 mg of dextran 70 per mL. Using a capillary tube viscometer having dimensions such that the flow time of water is not less than 100 seconds, measure the flow times of the diluted Injection and of a dextrose solution (4.5 in 100) at 20°. Calculate the intrinsic viscosity by the formula:

$$\{\ln[(R_D)(t / t_0)]\} / C$$

in which  $R_D$  is the ratio of the density of the diluted Injection to that of the dextrose solution;  $t$  and  $t_0$  are the flow times for the diluted Injection and the dextrose solution, respectively; and  $C$  is the concentration, in g per mL, of dextran 70 in the diluted Injection: the intrinsic viscosity is between 24 and 29 mL per g.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 3.5 and 7.0.

**Heavy metals, Method II** (231): 5 µg per mL.

**Limit of 5-hydroxymethylfurfural and related substances**—Dilute an accurately measured volume of Injection, equivalent to 1.0 g of  $C_6H_{12}O_6 \cdot H_2O$ , with water to 500.0 mL. Determine the absorbance of this solution in a 1-cm cell at 284 nm, using water as the blank: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements for *Injections* (1) and for *Particulate Matter in Injections* (788).

**Assay for dextrose**—Proceed as directed in the *Assay for dextrose* under *Dextran 40 in Dextrose Injection* except that the *Assay preparation* for Dextran 70 in Dextrose Injection is obtained by dilution with water (10 mL in 25 mL of water). Adjust the calculations of the dextrose content to take into consideration the dilution factor.

**Assay for dextran 70**—To 25 mL of Injection add 1 drop of 5 N ammonium hydroxide, and mix. Determine the optical rotation (see *Optical Rotation* (781)) in a suitable polarimeter and calculate the concentration, in g per 100 mL, of dextran 70 in the Injection by the formula:

$$(1 / 197.5)[(100a / l) - (52.75C_d)]$$

in which 197.5 and 52.75 represent average values for the specific rotation of dextran 70 and dextrose, respectively,  $a$  is the observed optical rotation in degrees,  $l$  is the length, in dm, of the polarimeter tube, and  $C_d$  is the concentration of dextrose, in g per 100 mL, from the *Assay for dextrose*.

## Dextran 70 in Sodium Chloride Injection

» Dextran 70 in Sodium Chloride Injection is a sterile solution of Dextran 70 and Sodium Chloride in Water for Injection. It contains in each 100 mL not less than 5.4 g and not more than 6.6 g of dextran 70 and not less than 0.81 g and not more than 0.99 g of sodium chloride. It contains no bacteriostatic agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—

USP Endotoxin RS

**Color of solution**—Its absorbance, determined at 375 nm against a water blank, is not greater than 0.04.

**Identification**—Quantitatively dilute a portion of Injection with sodium chloride solution (0.9 in 100) to a concentration of about 10 mg of dextran 70 per mL. Using a capillary tube viscometer having dimensions such that the flow time of water is not less than 100 seconds, measure the times of the diluted Injection and sodium chloride solution (0.9 in 100) at 20°. Calculate the intrinsic viscosity by the formula:

$$\{\ln[(R_D)(t / t_0)]\} / C$$

in which  $R_D$  is the ratio of the density of the diluted Injection to that of the sodium chloride solution;  $t$  and  $t_0$  are the flow times for the diluted Injection and the sodium chloride solution, respectively; and  $C$  is the concentration, in g per mL, of dextran 70 in the diluted Injection: the intrinsic viscosity is between 24 and 29 mL per g.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 4.0 and 7.0.

**Heavy metals, Method II** (231): 5 µg per mL.

**Other requirements**—It meets the requirements for *Injections* (1) and for *Particulate Matter in Injections* (788).

**Assay for sodium chloride**—Pipet a volume of Injection, equivalent to about 90 mg of chloride, into a porcelain casserole, and add 100 mL of water and 1 mL of dichlorofluorescein TS. Mix, and titrate with 0.1 N silver nitrate VS until the silver chloride flocculates and the mixture acquires a faint pink color. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of sodium chloride.

**Assay for dextran 70**—To 25 mL of Injection add 1 drop of 5 N ammonium hydroxide, and mix. Determine the optical rotation (see *Optical Rotation* (781)) in a suitable polarimeter and calculate the concentration, in g per 100 mL, of dextran 70 in the Injection taken by the formula:

$$100(a/l)(1/197.5)$$

in which 197.5 represents an average value for the specific rotation of dextran 70;  $a$  is the observed optical rotation, in degrees; and  $l$  is the length, in dm, of the polarimeter tube.

## Dextroamphetamine Sulfate

(C<sub>9</sub>H<sub>13</sub>N)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub> 368.49  
Benzeneethanamine,  $\alpha$ -methyl-, (*S*)-, sulfate (2:1).  
(+)- $\alpha$ -Methylphenethylamine sulfate (2:1) [51-63-8].

» Dextroamphetamine Sulfate, the dextrorotatory isomer of amphetamine sulfate, contains not less than 98.0 percent and not more than 102.0 percent of (C<sub>9</sub>H<sub>13</sub>N)<sub>2</sub> · H<sub>2</sub>SO<sub>4</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Dextroamphetamine Sulfate RS

USP Dextroamphetamine Related Compound A RS  
1-Phenyl-2-propanol.

C<sub>9</sub>H<sub>12</sub>O 136.20 [CAS-14898-87-4].

USP Dextroamphetamine Related Compound B RS  
Phenyl acetone.

C<sub>9</sub>H<sub>10</sub>O 134.18 [CAS-103-79-7].

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Specific rotation** (781S): between +20° and +23.5°.

*Test solution:* 40 mg per mL, in water.

**pH** (791): between 5.0 and 6.0, in a solution (1 in 20).

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

### Related compounds—

*Solution A, Solution B, Mobile phase, Resolution solution, and Chromatographic system*—Prepare as directed in the *Assay*.

*Standard solution*—Use the *Standard preparation*.

*Test solution*—Use the *Assay preparation*.

*Procedure*—Inject equal volumes (about 20  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, and record the chromatograms. Identify the impurities based on the relative retention times given in *Table 1*, and measure the peak responses. Calculate the percentage

of each dextroamphetamine related compound in the portion of Dextroamphetamine Sulfate taken by the formula:

$$100(C_s / C_U)(r_U/r_s)(1/F)$$

in which  $C_s$  and  $C_U$  are the concentrations, in mg per mL, of dextroamphetamine sulfate in the *Standard solution* and the *Test solution*, respectively;  $r_U$  is the peak area of each impurity obtained from the *Test solution*;  $r_s$  is the peak area of dextroamphetamine obtained from the *Standard solution*; and  $F$  is the relative response factor for each of the impurities relative to dextroamphetamine.

**Table 1**

Related Compound	Relative Retention Time (RRT)	Relative Response Factor (F)	Limit (w/w %)
Cathinone	0.81	55.6	NMT 0.25
Dextroamphetamine	1.0	1.0	—
Benzaldehyde	1.73	105.3	NMT 0.25
Dextroamphetamine related compound A	1.88	1.5	NMT 0.25
Dextroamphetamine related compound B	2.05	1.8	NMT 0.25
Individual unspecified impurity	—	1.0	NMT 0.1
Total	—	—	NMT 1.0

### Assay—

*Solution A*—Add 5.0 mL of trifluoroacetic acid to 900 mL of water; adjust with ammonium hydroxide to a pH of 2.2 $\pm$ 0.1; then add 100 mL of acetonitrile. Mix well, and degas.

*Solution B*—Use degassed acetonitrile.

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in a suitable volumetric flask, and dilute quantitatively with *Solution A* to obtain a solution having a known concentration of about 2.0 mg per mL.

*Resolution solution*—Transfer about 40 mL of the *Standard preparation* to a 50-mL volumetric flask. Using a microliter syringe, add 1  $\mu$ L each of USP Dextroamphetamine Related Compound A RS and USP Dextroamphetamine Related Compound B RS. Dilute with *Standard preparation* to volume.

*Assay preparation*—Dissolve an accurately weighed quantity of Dextroamphetamine Sulfate in a suitable volumetric flask, and dilute quantitatively with *Solution A* to obtain a solution having a known concentration of about 2.0 mg per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 257-nm detector and a 4.6-mm  $\times$  15-cm column that contains 5- $\mu$ m packing L1. The flow rate is about 1.5 mL per minute. The column is maintained at 40°. The chromatograph is programmed as follows, and data is collected for 30 minutes.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0–15	100→65	0→35	linear gradient
15–20	65→0	35→100	linear gradient
20–22	0	100	isocratic
22–23	0→100	100→0	linear gradient
23–30	100	0	re-equilibration

Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*. Identify the peaks using the relative retention times given in *Table 1*: the resolution,  $R$ , between dextroamphetamine related compound A and dextroamphetamine related compound B is not less than 3.0; the tailing factor for dextroamphetamine sulfate is not more than 3.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%. [NOTE—For identification purposes, the approximate relative retention times are given in *Table 1*.]

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the dextroamphetamine peak. Calculate the quantity, in percent of  $(C_9H_{13}N)_2 \cdot H_2SO_4$ , in the portion of Dextroamphetamine Sulfate taken by the formula:

$$100(C_S / C_U)(r_U / r_S)$$

in which  $C_S$  and  $C_U$  are the concentrations of dextroamphetamine sulfate, in mg per mL, of the *Standard preparation* and the *Assay preparation*, respectively; and  $r_U$  and  $r_S$  are the peak responses for dextroamphetamine sulfate in the *Assay preparation* and the *Standard preparation*, respectively.

## Dextroamphetamine Sulfate Capsules

» Dextroamphetamine Sulfate Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $(C_9H_{13}N)_2 \cdot H_2SO_4$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—  
USP Dextroamphetamine Sulfate RS

### Identification—

**A:** Mix an amount of the Capsule contents, equivalent to about 50 mg of dextroamphetamine sulfate, with about 10 mL of water for 30 minutes, and filter into a small flask. Cool the filtrate to about 15°, add 3 mL of 1 N sodium hydroxide, then add 1 mL of a mixture of 1 volume of benzoyl chloride and 2 volumes of anhydrous ethyl ether, and shake for 2 minutes. Filter the precipitate, wash with about 15 mL of cold water, and recrystallize twice from diluted alcohol: the benzoyl derivative of dextroamphetamine so obtained, after being dried at 105° for 1 hour, melts between 154° and 160°.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* is the same as that of the *Standard preparation* obtained in the *Assay*.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium:* water; 500 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  dissolved, employing the procedure set forth in the *Assay*, making any necessary modifications.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*Mobile phase*—Dissolve 1.1 g of sodium 1-heptanesulfonate in 525 mL of water. Add 25 mL of dilute glacial acetic acid (14 in 100) and 450 mL of methanol. Adjust dropwise, if necessary, with glacial acetic acid to a pH of  $3.3 \pm 0.1$ . Filter through a 0.5- $\mu$ m membrane filter. The volume of

methanol may be adjusted so that the retention time for dextroamphetamine is about 5 minutes.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in 0.12 N phosphoric acid to obtain a solution having a known concentration of about 0.3 mg per mL.

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and weigh. Transfer an accurately weighed portion of the mixed powder, equivalent to about 15 mg of dextroamphetamine sulfate, to a 50-mL volumetric flask. Add 40 mL of 0.12 N phosphoric acid, and sonicate for 15 minutes. Dilute with 0.12 N phosphoric acid to volume, and mix. Filter through a 0.5- $\mu$ m membrane filter, discarding the first 20 mL of the filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph three replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph by means of a suitable automatic injector or sampling valve, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  in the portion of Capsules taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dextroamphetamine Sulfate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dextroamphetamine Sulfate Tablets

» Dextroamphetamine Sulfate Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of  $(C_9H_{13}N)_2 \cdot H_2SO_4$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Dextroamphetamine Sulfate RS

### Identification—

**A:** Transfer a portion of finely ground Tablets, equivalent to about 50 mg of dextroamphetamine sulfate, to a suitable centrifuge tube. Add 25 mL of water, shake vigorously, and centrifuge until clear. Decant the clear solution into a 250-mL separator, add 5 mL of 2.5 N sodium hydroxide, mix, and extract with 60 mL of ether. Wash the ether extract with two 5-mL portions of 0.25 N sodium hydroxide, and discard the washings. Filter the ether extract through a pledget of cotton, previously saturated with ether, into a 100-mL beaker, and evaporate on a steam bath in a current of air to about 1 mL. Dissolve the residue in 3 mL of alcohol, and transfer to a glass-stoppered, 125-mL conical flask containing 25 mL of water. Rinse the beaker with 3 mL of alcohol, and transfer to the flask. Cool to about 15°, add 3 mL of 1 N sodium hydroxide, then add 1 mL of a mixture of 1 volume of benzoyl chloride and 2 volumes of anhydrous ethyl ether, and shake for 2 minutes. Filter the precipitate, wash with about 15 mL of cold water, and recrystallize twice from diluted alcohol: the benzoyl derivative of dextro-

amphetamine so obtained, after being dried at 105° for 1 hour, melts between 154° and 160°.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium:* water; 500 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

Determine the amount of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  dissolved by employing the following method.

*Mobile phase*—Dissolve 1.1 g of sodium 1-heptanesulfonate in 575 mL of water. Add 25 mL of dilute glacial acetic acid (14 in 100) and 400 mL of methanol. Adjust by the dropwise addition of glacial acetic acid to a pH of  $3.3 \pm 0.1$ , if necessary, filter, and degas the solution. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 210-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The column temperature is maintained at 40°. Chromatograph replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.0%.

*Procedure*—Inject a volume (about 100  $\mu$ L) of a filtered portion of the solution under test into the chromatograph, record the chromatogram, and measure the response for the major peak. Calculate the quantity of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  dissolved in comparison with a *Standard solution* having a known concentration of USP Dextroamphetamine Sulfate RS in the same *Medium* and similarly chromatographed.

*Tolerances*—Not less than 75% (*Q*) of the labeled amount of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Isomeric purity**—Pack a pledget of fine glass wool in the base of a 200- $\times$  25-mm chromatographic tube, with the aid of a tamping rod. Add 5 g of chromatographic siliceous earth, and tamp firmly to compress the material to a uniform mass.

Finely powder a number of Tablets, equivalent to about 300 mg of dextroamphetamine sulfate, mix the powder in a mortar with 5 g of chromatographic siliceous earth, add 1 mL of methanol and 0.5 mL of ammonium hydroxide, and triturate to a uniform mixture. Transfer the mixture without delay to the chromatographic tube, and tamp as before. Wipe the mortar and pestle with a small amount of glass wool, and insert it into the tube on top of the column. Arrange a 125-mL separator containing 35 mL of 0.1 N sulfuric acid to receive the effluent. Pass 60 mL of chloroform through the column. Shake the separator vigorously for 1 minute, allow the layers to separate, and discard the chloroform. Add to the aqueous phase in the separator 2.5 g of sodium bicarbonate, preventing it from coming in contact with the mouth of the separator, swirl until most of the bicarbonate has dissolved. By means of a 1-mL syringe, rapidly inject 1.0 mL of acetic anhydride directly into the contents of the separator. Immediately insert the stopper in the separator, and shake vigorously until the evolution of carbon dioxide has ceased, releasing the pressure as necessary through the stopcock. Allow to stand for 5 minutes, and extract the solution with 50 mL of chloroform, shaking vigorously for 1 minute. Filter the chloroform extract through a pledget of filter cotton into a 100-mL beaker, rinse the cotton with a small amount of chloroform, and evaporate on a steam bath in a current of air or nitrogen to dryness. Heat and triturate the residue until the odor of chloroform is no

longer perceptible. Allow the residue to cool, inducing it to crystallize. Reduce the crystals to a fine powder, heat at 80° for 30 minutes, and cool: the specific rotation of the acetilamphetamine so obtained, determined in a solution in chloroform containing 20 mg per mL, a 200-mm semimicro polarimeter tube being used, is between  $-37.5^\circ$  and  $-44.0^\circ$ .

**Assay**—

*Mobile phase*—Dissolve 1.1 g of sodium 1-heptanesulfonate in 525 mL of water. Add 25 mL of dilute glacial acetic acid (14 in 100) and 450 mL of methanol. Adjust dropwise, if necessary, with glacial acetic acid to a pH of  $3.3 \pm 0.1$ . Filter through a 0.5- $\mu$ m membrane filter. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextroamphetamine Sulfate RS in 0.12 N phosphoric acid to obtain a solution having a known concentration of about 0.3 mg per mL.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the mixed powder, equivalent to about 15 mg of dextroamphetamine sulfate, to a 50-mL volumetric flask. Add 40 mL of 0.12 N phosphoric acid, and sonicate for 15 minutes. Dilute with 0.12 N phosphoric acid to volume, and mix. Filter through a 0.5- $\mu$ m membrane filter, discarding the first 20 mL of the filtrate.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor is not more than 3, and the relative standard deviation is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $(C_9H_{13}N)_2 \cdot H_2SO_4$  in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dextroamphetamine Sulfate RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dextromethorphan

$C_{18}H_{25}NO$  271.40

Morphinan, 3-methoxy-17-methyl-, (9 $\alpha$ ,13 $\alpha$ ,14 $\alpha$ )-3-Methoxy-17-methyl-9 $\alpha$ ,13 $\alpha$ ,14 $\alpha$ -morphinan [125-71-3].

» Dextromethorphan contains not less than 98.0 percent and not more than 101.0 percent of  $C_{18}H_{25}NO$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dextromethorphan RS

**Identification—****A:** *Infrared Absorption* (197K).**B:** *Ultraviolet Absorption* (197U)—*Solution:* 100 µg per mL.*Medium:* dilute hydrochloric acid (1 in 120).

Absorptivities at 278 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

**Melting range, Class I** (741): between 109.5° and 112.5°.**Specific rotation** (781S)—*Test solution:* 100 mg per mL, in chloroform. Its specific rotation does not differ from that of the similarly prepared solution of USP Dextromethorphan RS by more than 1.0%.**Water, Method Ia** (921): not more than 0.5%.**Residue on ignition** (281): not more than 0.1%.**Heavy metals, Method II** (231): 0.002%.**Limit of *N,N*-dimethylaniline—***Standard solution*—Transfer about 50 mg of *N,N*-dimethylaniline to a 100-mL volumetric flask, add 70.0 mL of water, insert the stopper tightly, shake for 20 minutes using a mechanical wrist-action shaker or equivalent, dilute with water to volume, and mix. Transfer 1.0 mL to a 100-mL volumetric flask, dilute with water to volume, transfer 1.0 mL of this solution to a 25-mL volumetric flask, and add 19 mL of water.*Test solution*—Transfer about 500 mg of Dextromethorphan, accurately weighed, to a 25-mL volumetric flask, add 19 mL of water and 1 mL of 3 N hydrochloric acid, dissolve by warming on a steam bath, and cool.*Procedure*—Add 2 mL of 1 N acetic acid and 1 mL of sodium nitrite solution (1 in 100) to the *Test solution*, dilute with water to volume, and mix. This solution shows no more color than the straw yellow to greenish yellow color of the solution obtained from the *Standard solution* similarly treated: not more than 0.001% of *N,N*-dimethylaniline is found.**Limit of phenolic compounds**—Dissolve about 10 mg in 2 mL of 3 N hydrochloric acid, and add 2 drops of ferric chloride TS. Mix, add 2 drops of potassium ferricyanide TS, and observe after 2 minutes: no blue-green color develops.**Assay**—Dissolve about 700 mg of Dextromethorphan, accurately weighed, in 60 mL of glacial acetic acid, warming slightly, if necessary, to dissolve. Add 2 drops of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue-green endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 27.14 mg of C<sub>18</sub>H<sub>25</sub>NO.**Dextromethorphan Hydrobromide**C<sub>18</sub>H<sub>25</sub>NO · HBr · H<sub>2</sub>O 370.32

Morphinan, 3-methoxy-17-methyl-, (9α,13α,14α)-, hydrobromide, monohydrate.

3-Methoxy-17-methyl-9α,13α,14α-morphinan hydrobromide monohydrate [6700-34-1].

Anhydrous 352.32 [125-69-9].

» Dextromethorphan Hydrobromide contains not less than 98.0 percent and not more than 102.0 percent of C<sub>18</sub>H<sub>25</sub>NO · HBr, calculated on the anhydrous basis.**Packaging and storage**—Preserve in tight containers.**USP Reference standards** (11)—

USP Dextromethorphan Hydrobromide RS

**Identification—****A:** *Infrared Absorption* (197K)—*Test specimen*—Dry in vacuum over phosphorus pentoxide for 4 hours.**B:** *Ultraviolet Absorption* (197U)—*Solution:* 100 µg per mL.*Medium:* 0.1 N hydrochloric acid.

Absorptivities at 278 nm, calculated on the anhydrous basis, do not differ by more than 3.0%.

**C:** To 5 mL of a solution (1 in 200) add 5 drops of 2 N nitric acid and 2 mL of silver nitrate TS: a yellowish white precipitate is formed.**Specific rotation** (781S)—*Test solution:* 18 mg per mL (warm it, if necessary, to dissolve). Its specific rotation, determined photoelectrically at 325 nm, does not differ from that of the similarly prepared solution of USP Dextromethorphan Hydrobromide RS by more than 1.0%.**pH** (791): between 5.2 and 6.5 in a solution (1 in 100).**Water, Method I** (921): between 3.5% and 5.5%.**Residue on ignition** (281): not more than 0.1%.**Limit of *N,N*-dimethylaniline**—Proceed as directed in the test for *Limit of *N,N*-dimethylaniline* under *Dextromethorphan*, except to use Dextromethorphan Hydrobromide.**Limit of phenolic compounds**—To about 5 mg add 1 drop of 3 N hydrochloric acid, 1 mL of water, and 2 drops of ferric chloride TS. Mix, add 2 drops of potassium ferricyanide TS, and observe after 2 minutes: no blue-green color develops.**Assay—***Mobile phase*—Prepare a filtered and degassed solution containing 0.007 M docusate sodium and 0.007 M ammonium nitrate in a mixture of acetonitrile and water (70:30), and adjust the solution with glacial acetic acid to a pH of 3.4. [NOTE—Dissolve the docusate sodium in the acetonitrile and water mixture before adding the ammonium nitrate.]*Standard preparation*—Dissolve an accurately weighed quantity of USP Dextromethorphan Hydrobromide RS in water to obtain a stock solution having a known concentration of about 1 mg per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.*Assay preparation*—Transfer about 100 mg of Dextromethorphan Hydrobromide, accurately weighed, to a 100-mL volumetric flask, add water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-µm packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the major peak is not more than 2.5; and the relative standard deviation is not more than 2.0%.*Procedure*—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>18</sub>H<sub>25</sub>NO · HBr in the portion of Dextromethorphan Hydrobromide taken by the formula:

$$1000C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS in the *Standard preparation*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dextromethorphan Hydrobromide Oral Solution

» Dextromethorphan Hydrobromide Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Dextromethorphan Hydrobromide RS

### Identification—

**A:** Transfer about 50 mL of Oral Solution to a 250-mL separator, add 20 mL of water, 5 mL of 2.5 N sodium hydroxide, and 40 mL of solvent hexane, and shake thoroughly. Remove the solvent hexane layer, and filter through anhydrous sodium sulfate into a 150-mL beaker. Repeat the solvent hexane extraction, using two 40-mL portions and collecting the extracts in the beaker after filtering. Evaporate the combined extracts at 50° under nitrogen to dryness, and dissolve the residue in, and dilute with, 10 mL of chloroform: the solution is dextrorotatory (see *Optical Rotation* (781)). Retain the chloroform solution for *Identification* test B.

**B:** Evaporate the chloroform solution from *Identification* test A on a steam bath to dryness, dissolve the residue in 2 mL of 2 N sulfuric acid, and add 1 mL of a freshly prepared solution of mercuric nitrate (prepared by dissolving 700 mg of mercuric nitrate in 4 mL of water, adding 100 mg of sodium nitrate, mixing, and filtering): no red color is produced immediately, but after heating, a yellow to red color develops in about 15 minutes.

### Uniformity of dosage units (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

### Deliverable volume (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

### Assay—

*Mobile phase and Standard preparation*—Prepare as directed in the Assay under *Dextromethorphan Hydrobromide*.

*Assay preparation*—Pipet, using a to-contains pipet, a volume of Oral Solution, equivalent to about 10 mg of dextromethorphan hydrobromide, into a 100-mL volumetric flask, dilute with water to volume, and mix.

*Chromatographic system and Procedure* (see *Chromatography* (621))—Proceed as directed in the Assay under *Dextromethorphan Hydrobromide*. Calculate the quantity, in mg, of dextromethorphan hydrobromide ( $C_{18}H_{25}NO \cdot HBr \cdot H_2O$ ) in the volume of Oral Solution taken by the formula:

$$(370.32 / 352.32)(100C)(r_U / r_S)$$

in which 370.32 and 352.32 are the molecular weights of dextromethorphan hydrobromide and anhydrous dextromethorphan hydrobromide, respectively; C is the concentration, in mg per mL, of USP Dextromethorphan Hydrobromide RS, on the anhydrous basis, in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dextrose

$C_6H_{12}O_6 \cdot H_2O$  198.17

$C_6H_{12}O_6$  180.16

D-Glucose monohydrate [5996-10-1].  
Anhydrous [50-99-7].

### DEFINITION

Dextrose is a sugar usually obtained by the hydrolysis of starch. It contains one molecule of water of hydration or is anhydrous.

### IDENTIFICATION

- **A.**  
**Sample solution:** 1 in 20  
**Analysis:** Add a few drops of the *Sample solution* to 5 mL of hot alkaline cupric tartrate TS.  
**Acceptance criteria:** A copious red precipitate of cuprous oxide is formed.

### IMPURITIES

- **RESIDUE ON IGNITION (281):** NMT 0.1%
- **CHLORIDE AND SULFATE, Chloride (221)**  
**Control:** 0.50 mL of 0.020 N hydrochloric acid  
**Sample:** 2.0 g  
**Acceptance criteria:** 0.018%; the *Sample* shows no more chloride than the *Control*.
- **CHLORIDE AND SULFATE, Sulfate (221)**  
**Control:** 0.50 mL of 0.020 N sulfuric acid  
**Sample:** 2.0 g  
**Acceptance criteria:** 0.025%; the *Sample* shows no more sulfate than the *Control*.
- **ARSENIC, Method I (211):** NMT 1 µg/g
- **HEAVY METALS (231)**  
**Test preparation:** 4.0 g of Dextrose in water to make 25 mL  
**Acceptance criteria:** NMT 5 µg/g

### SPECIFIC TESTS

- **COLOR OF SOLUTION**  
**Control:** Mix 1.0 mL of cobaltous chloride CS, 3.0 mL of ferric chloride CS, and 2.0 mL of cupric sulfate CS with water to make 10 mL, and dilute 3 mL of this solution with water to 50 mL.  
**Sample solution:** 25 g of Dextrose in water to make 50.0 mL  
**Analysis:** Make the comparison by viewing the solutions downward in matched color-comparison tubes against a white surface.  
**Acceptance criteria:** The *Sample solution* has no more color than the *Control*.
- **ACIDITY**  
**Sample solution:** Dissolve 5.0 g in 50 mL of carbon dioxide-free water. Add phenolphthalein TS.  
**Analysis:** Titrate with 0.020 N sodium hydroxide to the production of a distinct pink color.  
**Acceptance criteria:** NMT 0.30 mL
- **WATER DETERMINATION, Method III (921)**  
**Analysis:** Dry at 105° for 16 h.  
**Acceptance criteria**  
Hydrous form: 7.5%–9.5%  
Anhydrous form: NMT 0.5%
- **OPTICAL ROTATION, Specific Rotation (781S)**  
**Sample solution:** 100 mg/mL of Dextrose in 0.012 N ammonium hydroxide

- Acceptance criteria:  $+52.6^{\circ}$  to  $+53.2^{\circ}$
- **DEXTRIN**  
Sample: 1 g, finely powdered  
Analysis: Reflux the *Sample* with 20 mL of alcohol.  
Acceptance criteria: The *Sample* dissolves completely.
- **SOLUBLE STARCH, SULFITES**  
Sample solution: 1 g of Dextrose in 10 mL of water  
Analysis: To the *Sample solution* add 1 drop of iodine TS.  
Acceptance criteria: The liquid is yellow.

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in well-closed containers.
- **LABELING:** Label to indicate whether it is hydrous or anhydrous.

**Dextrose Injection**

» Dextrose Injection is a sterile solution of Dextrose in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ). Dextrose Injection contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mL for Injections containing less than 5% of dextrose and not more than 10.0 USP Endotoxin Units per g for Injections containing between 5% and 70% of dextrose. [NOTE—Prior to analysis, dilute Injections containing more than 10% of dextrose to a concentration of 10% of dextrose.]

**Identification**—It responds to the *Identification* test under *Dextrose*.

**pH** (791): between 3.2 and 6.5, determined on a portion to which 0.30 mL of saturated potassium chloride solution has been added for each 100 mL and which previously has been diluted with water, if necessary, to a concentration of not more than 5% of dextrose.

**Particulate matter** (788): meets the requirements.

**Heavy metals** (231)—Transfer a volume of Injection, equivalent to 4.0 g of dextrose, to a suitable vessel, and adjust the volume to 25 mL by evaporation or addition of water, as necessary: the limit is 0.0005C%, in which C is the labeled amount, in g, of  $C_6H_{12}O_6 \cdot H_2O$  per mL of Injection.

**Limit of 5-hydroxymethylfurfural and related substances**—Dilute an accurately measured volume of Injection, equivalent to 1.0 g of  $C_6H_{12}O_6 \cdot H_2O$ , with water to 250.0 mL. Determine the absorbance of this solution in a 1-cm cell at 284 nm, with a suitable spectrophotometer, using water as the blank: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Transfer an accurately measured volume of Injection, containing 2 to 5 g of dextrose, to a 100-mL volumet-

ric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose monohydrate and anhydrous dextrose, respectively; A is 100 mm divided by the length of the polarimeter tube, in mm; and R is the observed rotation, in degrees.

**Dextrose and Sodium Chloride Injection**

» Dextrose and Sodium Chloride Injection is a sterile solution of Dextrose and Sodium Chloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) and of sodium chloride (NaCl). It contains no antimicrobial agents.

**Packaging and storage**—Preserve in single-dose glass or plastic containers. Glass containers are preferably of Type I or Type II glass.

**Labeling**—The label states the total osmolar concentration in mOsmol per L. Where the contents are less than 100 mL, or where the label states that the Injection is not for direct injection but is to be diluted before use, the label alternatively may state the total osmolar concentration in mOsmol per mL.

**USP Reference standards** (11)—  
USP Endotoxin RS

**Identification**—It responds to the *Identification* test under *Dextrose*, and to the tests for *Sodium* (191) and for *Chloride* (191).

**Bacterial endotoxins** (85)—It contains not more than 10.0 USP Endotoxin Units per g of dextrose.

**pH** (791): between 3.2 and 6.5, determined on a portion diluted with water, if necessary, to a concentration of not more than 5% of dextrose.

**Limit of 5-hydroxymethylfurfural and related substances**—Dilute an accurately measured volume of Injection, equivalent to 1.0 g of  $C_6H_{12}O_6 \cdot H_2O$  with water to 500.0 mL. Determine the absorbance of this solution in a 1-cm cell at 284 nm, with a suitable spectrophotometer, using water as the blank: the absorbance is not more than 0.25.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for dextrose**—Transfer an accurately measured volume of Injection, containing from 2 to 5 g of dextrose, to a 100-mL volumetric flask. Add 0.2 mL of 6 N ammonium hydroxide, dilute with water to volume, and mix. Determine the angular rotation in a suitable polarimeter tube (see *Optical Rotation* (781)). Calculate the percentage (g per 100 mL) of dextrose ( $C_6H_{12}O_6 \cdot H_2O$ ) in the portion of Injection taken by the formula:

$$(100/52.9)(198.17/180.16)AR$$

in which 100 is the percentage; 52.9 is the midpoint of the specific rotation range for anhydrous dextrose, in degrees; 198.17 and 180.16 are the molecular weights for dextrose

monohydrate and anhydrous dextrose, respectively;  $A$  is 100 mm divided by the length of the polarimeter tube, in mm; and  $R$  is the observed rotation, in degrees.

**Assay for sodium chloride**—Transfer an accurately measured volume of Injection, equivalent to about 90 mg of sodium chloride, to a conical flask, and add 10 mL of glacial acetic acid, 75 mL of methanol, and 3 drops of eosin Y TS. Titrate, with shaking, with 0.1 N silver nitrate VS to a pink endpoint. Each mL of 0.1 N silver nitrate is equivalent to 5.844 mg of NaCl.

## Diatrizoate Meglumine

$C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$  809.13  
Benzoic acid, 3,5-bis(acetylamino)-2,4,6-triiodo-, compd.  
with 1-deoxy-1-(methylamino)-D-glucitol (1:1).  
1-Deoxy-1-(methylamino)-D-glucitol 3,5-diacetamido-2,4,  
6-triiodobenzoate (salt) [131-49-7].

» Diatrizoate Meglumine contains not less than 98.0 percent and not more than 102.0 percent of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Diatrizoic Acid RS

USP Diatrizoic Acid Related Compound A RS

5-Acetamido-3-amino-2,4,6-triiodobenzoic acid.

$C_9H_7I_3N_2O_3$  571.88

### Identification—

**A:** It responds to the *Thin-Layer Chromatographic Identification Test* (201), the test solution and the Standard solution of USP Diatrizoic Acid RS being prepared at a concentration of 1 mg per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Heat about 500 mg in a suitable crucible: violet vapors are evolved.

**Specific rotation** (781S): between  $-5.65^\circ$  and  $-6.37^\circ$ .

*Test solution:* 100 mg per mL, in water.

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

### Iodine and iodide—

*Test preparation*—Transfer 2.0 g to a 50-mL centrifuge tube provided with a stopper, dilute with water to 24 mL, and shake to dissolve.

*Procedure*—Add 5 mL of toluene and 5 mL of 2 N sulfuric acid, shake, and centrifuge: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (1 in 50), shake, and centrifuge: any red color in the toluene layer is not darker than that obtained when a mixture of 2.0 mL of potassium iodide solution (1 in 4000) and 22 mL of water is substituted for the solution under test (0.02% of iodide).

### Heavy metals (231)—

*Standard preparation*—Transfer 2.0 mL of *Standard Lead Solution* (20 µg of Pb) to a 50-mL color-comparison tube, add 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix.

*Test preparation*—Dissolve 1.0 g of Diatrizoate Meglumine in 20 mL of water and 5 mL of 1 N sodium hydroxide, transfer the solution to a 50-mL color-comparison tube, dilute with water to 40 mL, and mix.

*Procedure*—To each of the tubes containing the *Standard preparation* and the *Test preparation* add 10 mL of sodium sulfide TS, mix, allow to stand for 5 minutes, and view downward over a white surface: the color of the solution from the *Test preparation* is not darker than that of the solution from the *Standard preparation* (0.002%).

**Free aromatic amine**—Transfer 1.0 g to a 50-mL volumetric flask, and add 5 mL of water and 10 mL of 0.1 N sodium hydroxide. To a second 50-mL volumetric flask transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of a Standard solution prepared by dissolving a suitable quantity of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide. Use 0.2 mL of 0.1 N sodium hydroxide for each 5.0 mg of Standard, and dilute with water to obtain a known concentration of 500 µg per mL. To a third 50-mL volumetric flask add 5 mL of water and 10 mL of 0.1 N sodium hydroxide to provide a blank.

Treat each flask as follows. Add 25 mL of dimethyl sulfoxide, insert the stopper, and mix by swirling gently. Chill in an ice bath in the dark for 5 minutes. [NOTE—In conducting the following steps, keep the flasks in the ice bath and in the dark as much as possible until all of the reagents have been added.] Slowly add 2 mL of hydrochloric acid, mix, and allow to stand for 5 minutes. Add 2 mL of sodium nitrite solution (1 in 50), mix, and allow to stand for 5 minutes. Add 1 mL of sulfamic acid solution (2 in 25), shake, and allow to stand for 5 minutes. [Caution—Considerable pressure is produced.] Add 2 mL of a 1 in 1000 solution of *N*-(1-naphthyl)-ethylenediamine dihydrochloride in dilute propylene glycol (7 in 10), and mix.

Remove the flasks from the ice bath and from storage in the dark, and allow to stand in a water bath at 22° to 25° for 10 minutes. Shake gently and occasionally during this period, releasing the pressure by loosening the stopper. Dilute with water to volume, and mix.

Within 5 minutes from the time of diluting the solutions in all three flasks to 50 mL, concomitantly determine the absorbances of the solution from the substance under test and the Standard solution in 1-cm cells at the wavelength of maximum absorbance at about 465 nm, with a suitable spectrophotometer, versus the prepared blank. The absorbance of the solution from the Diatrizoate Meglumine is not greater than that of the Standard solution (0.05%).

**Assay**—Transfer about 400 mg of Diatrizoate Meglumine, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 13.49 mg of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ .

## Diatrizoate Meglumine Injection

» Diatrizoate Meglumine Injection is a sterile solution of Diatrizoate Meglumine in Water for In-

jection, or a sterile solution of Diatrizoic Acid in Water for Injection prepared with the aid of Meglumine. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of diatrizoate meglumine ( $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ ). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Diatrizoate Meglumine Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve Injection intended for intravascular injection either in single-dose containers, preferably of Type I or Type III glass, protected from light or, where intended for administration with a pressure injector through a suitable transfer connection, in similar glass 500-mL or 1000-mL bottles, protected from light. Injection packaged for other than intravascular use may be packaged in 100-mL multiple-dose containers, preferably of Type I or Type III glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection, where packaged in single-dose containers, to direct the user to discard any unused portion remaining in the container or, where packaged in bulk bottles to state, "Bulk Container—only for sterile filling of pressure injectors," to state that it contains no antimicrobial preservatives, and to direct the user to discard any unused portion remaining in the container after 6 hours. Indicate also in the labeling of bulk bottles that a pressure injector is to be charged with a dose just prior to administration of the Injection. Label containers of Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**Identification**—

**A:** Dilute a volume of Injection, if necessary, with a 0.8 in 1000 solution of sodium hydroxide in methanol to obtain a test solution having a concentration of 1 mg per mL. The test solution responds to the *Thin-layer Chromatographic Identification Test* (201), the Standard solution being prepared at a concentration of 1 mg of USP Diatrizoic Acid RS per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Evaporate a volume of Injection, equivalent to about 500 mg of diatrizoate meglumine, to dryness, and heat the residue so obtained in a suitable crucible: violet vapors are evolved.

**Bacterial endotoxins** (85)—It contains not more than 1.1 USP Endotoxin Units per mL for Injections containing less than 50% of diatrizoate meglumine, and less than 5.0 USP Endotoxin Units per mL for Injections containing 50% or more of diatrizoate meglumine.

**pH** (791): between 6.0 and 7.7.

**Iodine and iodide**—Dilute a volume of Injection, equivalent to 2.0 g of diatrizoate meglumine, with 24 mL of water in a 50-mL centrifuge tube provided with a stopper. Add 5 mL of toluene and 5 mL of 2 N sulfuric acid, shake, and centrifuge: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (1 in 50), shake, and centrifuge: any red color in the toluene layer is not darker than that obtained when a volume of potassium iodide solution (1 in 4000), containing a quantity of iodide corresponding to 0.02% of the weight of diatrizoate meglumine in the vol-

ume of Injection taken, is diluted with water to 24 mL and substituted for the solution under test (0.02% of iodide).

**Heavy metals** (231)—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of diatrizoate meglumine, with 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed in the test for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Free aromatic amine**—Transfer a volume of Injection, accurately measured and equivalent to 1 g of diatrizoate meglumine, to a glass-stoppered, 50-mL volumetric flask. Dilute with water to 5 mL, and add 10 mL of 0.1 N sodium hydroxide. Into a second 50-mL volumetric flask pipet a known volume of a Standard solution prepared by dissolving a suitable quantity of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide. Use 0.2 mL of 0.1 N sodium hydroxide for each 5.0 mg of Standard, and dilute with water to obtain a known concentration of 500 µg per mL. The volume of Standard solution used contains a quantity of free aromatic amine corresponding to 0.05% of the weight of diatrizoate meglumine in the volume of Injection taken. Dilute with water to 5 mL, and add 10 mL of 0.1 N sodium hydroxide. Proceed as directed in the test for *Free aromatic amine* under *Diatrizoate Meglumine*, beginning with "To a third 50-mL volumetric flask add 5 mL of water".

**Meglumine content**—Determine the angular rotation (see *Optical Rotation* (781)) of the Injection, using a 10-cm cell and a suitable polarimeter. Calculate the content, in mg per mL, of meglumine in the Injection by the formula:

$$1000a / 24.9$$

in which *a* is the observed angular rotation, in degrees, corrected for the blank, and the factor, 24.9, is the average specific rotation, in degrees, of meglumine. The meglumine content is between 22.9% and 25.3% of the labeled amount of diatrizoate meglumine.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Pipet a volume of Injection, or a suitable dilution of it, equivalent to about 600 mg of diatrizoate meglumine, into a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the filter and the flask thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 13.49 mg of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ .

## Diatrizoate Meglumine and Diatrizoate Sodium Injection

» Diatrizoate Meglumine and Diatrizoate Sodium Injection is a sterile solution of Diatrizoate Meglumine and Diatrizoate Sodium in Water for Injection, or a sterile solution of Diatrizoic Acid in Water for Injection prepared with the aid of Sodium Hydroxide and Meglumine. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of diatrizoate meglumine ( $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ ) and of iodine (I). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium

or Edetate Disodium as a stabilizer. Diatrizoate Meglumine and Diatrizoate Sodium Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve either in single-dose containers, preferably of Type I or Type III glass, protected from light or, where intended for administration with a pressure injector through a suitable transfer connection, in similar glass 500-mL or 1000-mL bottles, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection, where packaged in single-dose containers, to direct the user to discard any unused portion remaining in the container or, where packaged in bulk bottles to state, "Bulk Container—only for sterile filling of pressure injectors," to state that it contains no antimicrobial preservatives, and to direct the user to discard any unused portion remaining in the container after 6 hours. Indicate also in the labeling of bulk bottles that a pressure injector is to be charged with a dose just prior to administration of the Injection. Label containers of Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP Diatrizoic Acid RS

USP Diatrizoic Acid Related Compound A RS

5-Acetamido-3-amino-2,4,6-triiodobenzoic acid.

$C_9H_{13}N_2O_3$  571.88

USP Endotoxin RS

**Identification**—

**A:** Dilute a volume of Injection, if necessary, with a 0.8 in 1000 solution of sodium hydroxide in methanol to obtain a test solution having a concentration of 1 mg per mL. The test solution responds to the *Thin-layer Chromatographic Identification Test* (201), the Standard solution being prepared at a concentration of 1 mg of USP Diatrizoic Acid RS per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Evaporate a volume of Injection, equivalent to about 500 mg of diatrizoate meglumine and diatrizoate sodium, to dryness, and heat the residue so obtained in a suitable crucible: violet vapors are evolved.

**Bacterial endotoxins** (85)—It contains not more than 1.8 USP Endotoxin Units per mL for Injections containing less than 60% of diatrizoate meglumine, and not more than 3.6 USP Endotoxin Units for Injections containing 60% or more of diatrizoate meglumine.

**pH** (791): between 6.0 and 7.7.

**Free aromatic amine**—Transfer an accurately measured volume of Injection, equivalent to about 1 g of diatrizoate meglumine and diatrizoate sodium, to a 50-mL volumetric flask. Dilute with water to 5 mL, and add 10 mL of 0.1 N sodium hydroxide. To a second 50-mL volumetric flask transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of a Standard solution prepared by dissolving a suitable quantity of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide. Use 0.2 mL of 0.1 N sodium hydroxide for each 5.0 mg of Standard, and dilute with water to obtain a known concentration of 500 µg per mL. Proceed as directed in the test for *Free aromatic amine* under *Diatrizoate Meglumine*, beginning with "To a third 50-mL volumetric flask add 5 mL of water".

**Iodine and iodide**—Transfer an accurately measured volume of Injection, equivalent to about 2.0 g of the total of diatrizoate meglumine and diatrizoate sodium, to a 50-mL centrifuge tube provided with a stopper. Dilute with water to 24 mL. Add 5 mL of toluene and 5 mL of 2 N sulfuric acid, shake, and centrifuge: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (1 in 50), shake,

and centrifuge: any red color in the toluene layer is not darker than that obtained when a volume of potassium iodide solution (1 in 4000), containing a quantity of iodide corresponding to 0.02% of the weight of diatrizoate meglumine and diatrizoate sodium in the volume of Injection taken is diluted with water to 24 mL and substituted for the solution under test (0.02% of iodide).

**Heavy metals** (231)—In a 50-mL color-comparison tube, mix a volume of Injection, equivalent to 1.0 g of the total of diatrizoate meglumine and diatrizoate sodium, with 5 mL of 1 N sodium hydroxide, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed in the test for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay for diatrizoate meglumine**—Pipet 5 mL of Injection into a 10-mL volumetric flask, add water to volume, and mix. Determine the angular rotation (see *Optical Rotation* (781)) of the diluted Injection, using a 100-mm tube. Calculate the content, in mg per mL, of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$  in the Injection by the formula:

$$2000a / 6.01$$

in which  $a$  is the observed angular rotation, in degrees, corrected for the blank, and the factor 6.01 is the specific rotation, in degrees, of diatrizoate meglumine.

**Assay for iodine**—Transfer an accurately measured volume of Injection, equivalent to about 4 g of the total of diatrizoate meglumine and diatrizoate sodium, to a 50-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 6.345 mg of iodine.

## Diatrizoate Meglumine and Diatrizoate Sodium Solution

» Diatrizoate Meglumine and Diatrizoate Sodium Solution is a solution of Diatrizoic Acid in Purified Water prepared with the aid of Meglumine and Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amounts of diatrizoate meglumine ( $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ ) and of iodine (I). It may contain small amounts of suitable buffers, Edetate Disodium, and flavoring agents.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label the container to indicate that the contents are not intended for parenteral use.

**USP Reference standards** (11)—

USP Diatrizoic Acid RS

**Identification**—

**A:** Dilute a volume of Solution, if necessary, with an 0.8 in 1000 solution of sodium hydroxide in methanol, to ob-

tain a test solution having a concentration of 1 mg per mL. The test solution responds to the *Thin-Layer Chromatographic Identification Test* (201), the Standard solution being prepared at a concentration of 1 mg of USP Diatrizoic Acid RS per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Evaporate a volume of Solution, equivalent to about 500 mg of diatrizoate meglumine and diatrizoate sodium, to dryness, and heat the residue so obtained in a crucible: violet vapors are evolved.

**pH** (791): between 6.0 and 7.6.

**Iodine and iodide**—Using as the *Test preparation* a volume of Solution equivalent to about 2 g of diatrizoate meglumine and diatrizoate sodium and diluting it with water to 24 mL in a 50-mL centrifuge tube provided with a stopper, proceed as directed for *Procedure* in the test for *Iodine and iodide* under *Diatrizoate Meglumine*.

**Assay for diatrizoate meglumine**—Pipet a volume of Solution, equivalent to about 1.5 g of diatrizoate meglumine and diatrizoate sodium, into a 250-mL volumetric flask, dilute with water to volume, and mix. Pipet 10 mL of the solution so obtained into a glass-stoppered, 250-mL flask. Add 4 mL of 2 N sulfuric acid and 20 mL of sodium metaperiodate solution (1 in 200). Insert the stopper, and set aside in the dark for 1 hour. Add 50 mL of water, mix, and add 10 mL of potassium iodide TS. Insert the stopper quickly, mix by swirling for 20 seconds, and immediately titrate with 0.1 N sodium thiosulfate VS, using 3 mL of starch TS. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N sodium thiosulfate is equivalent to 10.11 mg of  $C_{11}H_9I_3N_2O_4 \cdot C_7H_{17}NO_5$ .

**Assay for iodine**—Transfer an accurately measured volume of Solution, equivalent to about 4 g of the total of diatrizoate meglumine and diatrizoate sodium, to a 50-mL volumetric flask, dilute with water to volume, and mix. Pipet 5 mL of this solution into a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 6.345 mg of iodine.

## Diatrizoate Sodium

$C_{11}H_8I_3N_2NaO_4$  635.90

Benzoic acid, 3,5-bis(acetylamino)-2,4,6-triiodo-, monosodium salt.

Monosodium 3,5-diacetamido-2,4,6-triiodobenzoate [737-31-5].

» Diatrizoate Sodium contains not less than 98.0 percent and not more than 102.0 percent of  $C_{11}H_8I_3N_2NaO_4$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in well-closed containers. Store at room temperature.

**USP Reference standards** (11)—

USP Diatrizoic Acid RS

USP Diatrizoic Acid Related Compound A RS

5-Acetamido-3-amino-2,4,6-triiodobenzoic acid.

$C_9H_7I_3N_2O_3$  571.88

**Identification**—

**A:** It responds to the *Thin-layer Chromatographic Identification Test* (201), the test solution and the Standard solution being prepared at a concentration of 1 mg of USP Diatrizoic Acid RS per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Heat about 500 mg in a suitable crucible: violet vapors are evolved.

**C:** It responds to the flame test for *Sodium* (191).

**Water, Method I** (921): not more than 10.0%.

**Free aromatic amine**—Transfer 1.0 g to a 50-mL volumetric flask, and add 5 mL of water and 10 mL of 0.1 N sodium hydroxide. Proceed as directed in the test for *Free aromatic amine* under *Diatrizoate Meglumine*, beginning with "To a second 50-mL volumetric flask transfer 4 mL of water."

**Iodine and iodide**—

*Test preparation*—Transfer 2.0 g to a 50-mL centrifuge tube provided with a stopper, dilute with water to 24 mL, and shake to dissolve.

*Procedure*—Proceed as directed for *Procedure* in the test for *Iodine and iodide* under *Diatrizoate Meglumine*.

**Heavy metals** (231)—Dissolve 1.0 g of Diatrizoate Sodium in 20 mL of water and 5 mL of 1 N sodium hydroxide, transfer the solution to a 50-mL color-comparison tube, dilute with water to 40 mL, and mix. Using this as the *Test preparation*, proceed as directed for *Heavy metals* under *Diatrizoate Meglumine*: the limit is 0.002%.

**Assay**—Transfer about 300 mg of Diatrizoate Sodium, accurately weighed, to a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 10.60 mg of  $C_{11}H_8I_3N_2NaO_4$ .

## Diatrizoate Sodium Injection

» Diatrizoate Sodium Injection is a sterile solution of Diatrizoate Sodium in Water for Injection, or a sterile solution of Diatrizoic Acid in Water for Injection prepared with the aid of Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of diatrizoate sodium ( $C_{11}H_8I_3N_2NaO_4$ ). It may contain small amounts of suitable buffers and of Edetate Calcium Disodium or Edetate Disodium as a stabilizer. Diatrizoate Sodium Injection intended for intravascular use contains no antimicrobial agents.

**Packaging and storage**—Preserve Injection intended for intravascular injection in single-dose containers, preferably of Type I or Type III glass, protected from light. Injection intended for other than intravascular use may be packaged in 100-mL multiple-dose containers, preferably of Type I or Type III glass, protected from light.

**Labeling**—Label containers of Injection intended for intravascular injection to direct the user to discard any unused portion remaining in the container. Label containers of Injection intended for other than intravascular injection to show that the contents are not intended for intravascular injection.

**USP Reference standards** (11)—

USP Diatrizoic Acid RS

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—Pipet into a glass-stoppered 125-mL conical flask a volume of Injection, equivalent to about 500 mg of diatrizoate sodium. Add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, and reflux the mixture for 1 hour. Cool to room temperature, wash the condenser with 20 mL of water, and filter the mixture. Wash the flask and the filter with small portions of water, adding the washings to the filtrate. Add to the filtrate 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the color of the yellow precipitate just changes to green. Each mL of 0.05 N silver nitrate is equivalent to 10.60 mg of  $C_{11}H_8I_3N_2NaO_4$ .

## Diatrizoate Sodium Solution

» Diatrizoate Sodium Solution is a solution of Diatrizoate Sodium in Purified Water, or a solution of Diatrizoic Acid in Purified Water prepared with the aid of Sodium Hydroxide. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of diatrizoate sodium ( $C_{11}H_8I_3N_2NaO_4$ ). It may contain a suitable preservative.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**Labeling**—Label the container to indicate that the contents are not intended for parenteral use.

**USP Reference standards** (11)—

USP Diatrizoic Acid RS

**Identification**—

**A:** Dilute a volume of Solution, if necessary, with a 0.8 in 1000 solution of sodium hydroxide in methanol to obtain a test solution having a concentration of 1 mg per mL. The test solution responds to the *Thin-layer Chromatographic Identification Test* (201), the Standard solution being prepared at a concentration of 1 mg of USP Diatrizoic Acid RS per mL in a 0.8 in 1000 solution of sodium hydroxide in methanol, the solvent mixture being a mixture of chloroform, methanol, and ammonium hydroxide (20:10:2), and short-wavelength UV light being used to locate the spots.

**B:** Evaporate a volume of Solution, equivalent to about 500 mg of diatrizoate sodium, to dryness, and heat the residue so obtained in a suitable crucible: violet vapors are evolved.

**pH** (791): between 4.5 and 7.5.

**Iodine and iodide**—Using as the *Test preparation* a volume of Solution equivalent to 2.0 g of diatrizoate sodium and diluting it with water to 24 mL in a 50-mL centrifuge tube provided with a stopper, proceed as directed for *Procedure* in the test for *Iodine and iodide* under *Diatrizoate Meglumine*.

**Assay**—Pipet a volume of Solution, equivalent to about 400 mg of diatrizoate sodium, into a 125-mL conical flask. Add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 hour. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS, and titrate with 0.05 N silver nitrate VS until the yellow precipitate just turns green. Each mL of 0.05 N silver nitrate is equivalent to 10.60 mg of  $C_{11}H_8I_3N_2NaO_4$ .

## Diatrizoic Acid

$C_{11}H_8I_3N_2O_4$  (anhydrous) 613.91

$C_{11}H_8I_3N_2O_4 \cdot 2H_2O$  649.95

Benzoic acid, 3,5-bis(acetylamino)-2,4,6-triiodo-;  
3,5-Diacetamido-2,4,6-triiodobenzoic acid [117-96-4].  
Dihydrate [50978-11-5].

**DEFINITION**

Diatrizoic Acid is anhydrous or contains two molecules of water of hydration. It contains NLT 98.0% and NMT 102.0% of diatrizoic acid ( $C_{11}H_9I_3N_2O_4$ ), calculated on the anhydrous basis.

**IDENTIFICATION****• A. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST (201)**

**Solution A:** Sodium hydroxide in methanol (0.8 in 1000)

**Standard solution:** 1 mg/mL in *Solution A*

**Sample solution:** 1 mg/mL in *Solution A*

**Developing solvent system:** Chloroform, methanol, and ammonium hydroxide (20:10:2)

**Analysis:** Use short-wavelength UV light to locate the spots.

**Acceptance criteria:** Meets the requirements

**• B.**

**Sample:** 500 mg

**Analysis:** Heat the *Sample* in a suitable crucible.

**Acceptance criteria:** Violet vapors are evolved.

**ASSAY****• PROCEDURE**

**Sample:** 300 mg

**Titrimetric system**

(See *Titrimetry* (541).)

**Mode:** Direct titration

**Titrant:** 0.05 N silver nitrate VS

**Endpoint detection:** Visual

**Analysis:** Transfer the *Sample* to a glass-stoppered, 125-mL conical flask, add 30 mL of 1.25 N sodium hydroxide and 500 mg of powdered zinc, connect the flask to a reflux condenser, and reflux the mixture for 1 h. Cool the flask to room temperature, rinse the condenser with 20 mL of water, disconnect the flask from the condenser, and filter the mixture. Rinse the flask and the filter thoroughly, adding the rinsings to the filtrate. Add 5 mL of glacial acetic acid and 1 mL of tetrabromophenolphthalein ethyl ester TS. Titrate the *Sample* with *Titrant* until the yellow precipitate just turns green. Each mL of *Titrant* is equivalent to 10.23 mg of diatrizoic acid ( $C_{11}H_9I_3N_2O_4$ ).

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

**IMPURITIES****• RESIDUE ON IGNITION (281):** NMT 0.1%**• HEAVY METALS (231)**

**Standard solution:** To 2.0 mL of *Standard Lead Solution* (20 µg of Pb) in a 50-mL color-comparison tube add 5 mL of 1 N sodium hydroxide, and dilute with water to 40 mL.

**Sample solution:** Transfer 2.0 mL of solution, prepared as directed for *Sample solution* in the test for *Iodine and Iodide*, to a 50-mL color-comparison tube. Add 5 mL of 1 N sodium hydroxide, and dilute with water to 40 mL.

**Analysis:** To each of the tubes containing the *Standard solution* and the *Sample solution* add 10 mL of sodium sulfide TS, allow to stand for 5 min, and view downward over a white surface.

**Acceptance criteria:** 20 ppm; the color of the *Sample solution* is not darker than that of the *Standard solution*.

**• FREE AROMATIC AMINE**

**Standard stock solution:** Dissolve a suitable quantity of USP Diatrizoic Acid Related Compound A RS in 0.1 N sodium hydroxide. Use 0.2 mL of 0.1 N sodium hydroxide for each 5.0 mg of Standard, and dilute with water to obtain 500 µg/mL.

**Standard solution:** Transfer 4 mL of water, 10 mL of 0.1 N sodium hydroxide, and 1.0 mL of a *Standard stock solution* to a 50-mL volumetric flask.

**Sample solution:** Transfer 1.0 g to a 50-mL volumetric flask, and add 12.5 mL of water and 2.5 mL of 0.1 N sodium hydroxide.

**Blank:** Transfer 5 mL of water and 10 mL of 0.1 N sodium hydroxide to a 50-mL volumetric flask.

**Analysis:** Treat each flask as follows. Add 25 mL of dimethyl sulfoxide, insert the stopper, and mix by swirling gently. Chill in an ice bath in the dark for 5 min. In conducting the following steps, keep the flasks in the ice bath and in the dark as much as possible until all of the reagents have been added.

Slowly add 2 mL of hydrochloric acid, and allow to stand for 5 min. Add 2 mL of sodium nitrite solution (20 mg/mL), and allow to stand for 5 min. Add 1 mL of sulfamic acid solution (80 mg/mL), shake, and allow to stand for 5 min. [NOTE—Considerable pressure is produced.] Add 2 mL of a solution (1 mg/mL) of *N*-(1-naphthyl)-ethylenediamine dihydrochloride in dilute propylene glycol (700 mg/mL). Remove the flasks from the ice bath and from storage in the dark, and allow to stand in a water bath at 22°–25° for 10 min. Shake gently and occasionally during this period, releasing the pressure by loosening the stopper. Dilute with water to volume.

**Instrumental conditions**

(See *Spectrophotometry and Light-Scattering* (851).)

**Mode:** Vis

**Analytical wavelength:** 465 nm

**Cell:** 1 cm

**Analysis:** Within 5 min from the time of diluting the solutions in all three flasks to 50 mL, concomitantly determine the absorbances of the solutions.

**Acceptance criteria:** 0.05%; the absorbance of the *Sample solution* is NMT that of the *Standard solution*.

**SPECIFIC TESTS****• WATER DETERMINATION, Method I (921):** NMT 1.0% (anhydrous form), and between 4.5% and 7.0% (hydrous form)**• IODINE AND IODIDE**

**Sample solution:** Suspend 10.0 g in 10 mL of water, and add in small portions, with stirring, 1.5 mL of sodium hydroxide solution (400 mg/mL). When the solution is complete, adjust to a pH between 7.0 and 7.5 with a dilute solution (8 mg/mL) of sodium hydroxide or hydrochloric acid, and dilute with water to 20 mL.

**Analysis:** Dilute 4.0 mL of *Sample solution* with 20 mL of water in a 50-mL centrifuge tube provided with a stopper, add 5 mL of toluene and 5 mL of 2 N sulfuric acid, shake, and centrifuge: the toluene layer shows no red color. Add 1 mL of sodium nitrite solution (20 mg/mL), shake, and centrifuge.

**Acceptance criteria:** NMT 0.02% of iodide; any red color in the toluene layer is not darker than that obtained when a mixture of 2.0 mL of potassium iodide solution (0.25 mg/mL) and 22 mL of water is substituted for the solution under test.

**ADDITIONAL REQUIREMENTS****• PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at room temperature.**• LABELING:** Label it to indicate whether it is anhydrous or hydrous.**• USP REFERENCE STANDARDS (11)**

USP Diatrizoic Acid RS

USP Diatrizoic Acid Related Compound A RS

5-Acetamido-3-amino-2,4,6-triiodobenzoic acid.

$C_9H_7I_3N_2O_3$  571.88

## Diazepam

$C_{16}H_{13}ClN_2O$  284.74

2H-1,4-Benzodiazepin-2-one, 7-chloro-1,3-dihydro-1-methyl-5-phenyl-

7-Chloro-1,3-dihydro-1-methyl-5-phenyl-2H-1,4-benzodiazepin-2-one [439-14-5].

» Diazepam contains not less than 95.0 percent and not more than 105.0 percent of  $C_{16}H_{13}ClN_2O$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Diazepam RS

USP Diazepam Related Compound A RS  
2-Methylamino-5-chlorobenzophenone.  
 $C_{14}H_{12}ClNO$  245.71

USP Diazepam Related Compound B RS  
3-Amino-6-chloro-1-methyl-4-phenylcarbostyryl.  
 $C_{16}H_{13}ClN_2O$  284.74

USP Nordazepam RS  
7-Chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one.  
 $C_{15}H_{11}ClN_2O$  270.72

### Identification—

**A:** Infrared Absorption (197K).

**B:** Thin-Layer Chromatographic Identification Test (201)—  
Test solution: 5 mg per mL, in acetone.

Developing solvent system: a mixture of ethyl acetate and n-heptane (1:1).

Procedure—Proceed as directed in the chapter except use an unsaturated developing chamber.

**Melting range**, Class I (741): between 131° and 135°.

**Loss on drying** (731)—Dry it in vacuum over phosphorus pentoxide at 60° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals**, Method II (231): 0.002%.

### Related compounds—

Mobile phase, System suitability solution, and Chromatographic system—Proceed as directed in the Assay.

Standard solution—Dissolve accurately weighed quantities of USP Diazepam Related Compound B RS, USP Diazepam Related Compound A RS, and USP Nordazepam RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having known concentrations of about 1 µg per mL, 0.1 µg per mL, and 3 µg per mL, respectively.

Test solution—Transfer about 10 mg of Diazepam, accurately weighed, to a 10-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Procedure—Separately inject equal volumes (about 10 µL) of the Standard solution and the Test solution into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of diazepam related compound B, diazepam related com-

pound A, and nordazepam in the portion of Diazepam taken by the formula:

$$(C_R / W)(r_U / r_S)$$

in which  $C_R$  is the concentration, in µg per mL, of USP Diazepam Related Compound B RS, USP Diazepam Related Compound A RS, or USP Nordazepam RS in the Standard solution;  $W$  is the weight, in mg, of Diazepam taken to prepare the Test solution; and  $r_U$  and  $r_S$  are the peak responses obtained from the Test solution and the Standard solution, respectively: not more than 0.01% of diazepam related compound A, not more than 0.1% of diazepam related compound B, and not more than 0.3% of nordazepam are found.

Calculate the percentage of any other impurity in the portion of Diazepam taken by the formula:

$$(C_S / W)(r_i / r_S)$$

in which  $C_S$  is the concentration, in µg per mL, of USP Diazepam Related Compound B RS in the Standard solution;  $r_i$  is the peak response for any other impurity obtained from the Test solution; and  $r_S$  is the peak response of USP Diazepam Related Compound B RS obtained from the Standard solution: not more than 0.1% of any other impurity is found; and not more than 1.0% of the total impurities is found.

### Assay—

Mobile phase—Prepare a filtered and degassed mixture of acetonitrile, water, and methanol (2:2:1). Make adjustments if necessary (see System Suitability under Chromatography (621)).

System suitability solution—Dissolve suitable quantities of USP Nordazepam RS and USP Diazepam RS in methanol, using sonication if necessary, to obtain a solution containing about 0.1 mg of each per mL.

Standard preparation—Dissolve an accurately weighed quantity of USP Diazepam RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.1 mg per mL.

Assay preparation—Transfer about 10 mg of Diazepam, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with methanol to volume, and mix.

Chromatographic system (see Chromatography (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 15-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the System suitability solution, and record the peak responses as directed for Procedure: the relative retention times are about 0.76 for nordazepam and 1.0 for diazepam; the resolution,  $R$ , between nordazepam and diazepam is not less than 4; the column efficiency is not less than 5000 theoretical plates for the diazepam peak; the tailing factor for diazepam is not more than 2.0; and the relative standard deviation for the diazepam peak for replicate injections is not more than 2.0%.

Procedure—Separately inject equal volumes (about 10 µL) of the Standard preparation and the Assay preparation into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{16}H_{13}ClN_2O$  in the portion of Diazepam taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Diazepam RS in the Standard preparation; and  $r_U$  and  $r_S$  are the peak responses obtained from the Assay preparation and the Standard preparation, respectively.

## Diazepam Capsules

» Diazepam Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diazepam ( $C_{16}H_{13}ClN_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Diazepam RS

USP Nordazepam RS

7-Chloro-1,3-dihydro-5-phenyl-2H-1,4-benzodiazepin-2-one.

$C_{15}H_{11}ClN_2O$  270.72

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

**B:** Transfer an accurately weighed amount of Capsule contents, equivalent to about 10 mg of diazepam, to a 50-mL centrifuge tube, and add 2 mL of acetone. Place the centrifuge tube in an ultrasonic bath for 5 minutes, and centrifuge. Using 100  $\mu$ L of the supernatant as the test solution, and 100  $\mu$ L of a solution of USP Diazepam RS in acetone containing 5 mg per mL as the Standard solution, proceed as directed for *Identification test B* under *Diazepam*.

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 900 mL.

*Apparatus 1:* 100 rpm.

*Time:* 45 minutes.

*Procedure*—Determine the amount of  $C_{16}H_{13}ClN_2O$  dissolved by employing UV absorption at the wavelength of maximum absorbance at about 284 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Diazepam RS in the same *Medium*.

*Tolerances*—Not less than 85% (Q) of the labeled amount of  $C_{16}H_{13}ClN_2O$  is dissolved in 45 minutes.

**Uniformity of dosage units (905):** meet the requirements.

### Assay—

*Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Diazepam*.

*Assay preparation*—Weigh and mix the contents of not less than 20 Capsules. Transfer an accurately weighed portion of the capsule contents, equivalent to about 10 mg of diazepam, to a 100-mL volumetric flask. Add 50 mL of methanol, sonicate for 5 minutes, shake by mechanical means for 5 minutes, dilute with methanol to volume, mix, and filter, discarding the first few mL of the filtrate.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diazepam ( $C_{16}H_{13}ClN_2O$ ) in the portion of Capsules taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Diazepam RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazepam Extended-Release Capsules

» Diazepam Extended-Release Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diazepam ( $C_{16}H_{13}ClN_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Diazepam RS

USP Ethylparaben RS

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**B:** Accurately weigh a quantity of Capsule contents, equivalent to 10 mg of diazepam, place in a 50-mL centrifuge tube, and add 2 mL of acetone. Place the centrifuge tube in an ultrasonic bath for 5 minutes, remove from the ultrasonic bath, and centrifuge. Using 100  $\mu$ L of the supernatant as the test solution, and 100  $\mu$ L of a solution of USP Diazepam RS in acetone containing 5 mg per mL as the Standard solution, proceed as directed in *Identification test B* under *Diazepam*.

### Dissolution (711)—

*Medium:* simulated gastric fluid TS, prepared without enzymes; 900 mL.

*Apparatus 1:* 100 rpm.

*Times:* 1, 4, 8, and 12 hours.

*Mobile phase*—Prepare a suitable degassed and filtered mixture of methanol and water (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Buffer solution*—Dissolve 77.1 g of ammonium acetate in water to make 1000 mL of solution, and adjust with ammonium hydroxide to a pH of 8.7.

*Standard solution*—Dissolve an accurately weighed quantity of USP Diazepam RS in *Medium*, dilute quantitatively with *Medium* to obtain a solution having a known concentration of about 0.15 mg per mL, and mix. Transfer 2.0-, 5.0-, 8.0-, and 10.0-mL aliquots of this solution to separate 100-mL volumetric flasks, add *Medium* to volume, and mix. Pipet 1.0 mL of each solution and 1.0 mL of *Buffer solution* into individual small vials, mix, and allow to stand at room temperature for about 10 minutes.

*Test solution*—Wrap each Capsule in a coil made from a 10-cm piece of 18-gauge copper wire weighing approximately 750 mg, so that the wire encircles the Capsule 4 times. The Capsule enclosed in the coil remains at the bottom of the basket (it should not float). Pass a portion of the solution under test, obtained at each time interval, through a suitable filter having a 0.6- $\mu$ m porosity. Pipet 1.0 mL of each solution and 1.0 mL of *Buffer solution* into individual small vials, mix, and allow to stand at room temperature for about 10 minutes.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and an 8-mm  $\times$  10-cm column that contains packing L1. The flow rate is about 5.0 mL per minute. Chromatograph the appropriate *Standard solution*, and record the peak responses as directed for *Procedure*: the tailing factor is not greater than 1.7; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 100  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Determine the

amount of  $C_{16}H_{13}ClN_2O$  dissolved from peak responses of diazepam obtained from the *Test solution* and the *Standard solution*.

**Tolerances**—The percentage of the labeled amount of  $C_{16}H_{13}ClN_2O$  dissolved is within the range stated at each of the following times.

Time (hours)	Amount dissolved
1	between 15% and 27%
4	between 49% and 66%
8	between 76% and 96%
12	between 85% and 115%

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

**Mobile phase and Chromatographic system**—Prepare as directed in the *Assay* under *Diazepam*.

**Internal standard solution**—Dissolve an accurately weighed quantity of USP Ethylparaben RS in methanol to obtain a solution having a known concentration of about 1.5 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diazepam RS in methanol, quantitatively dilute with methanol to obtain a solution having a known concentration of about 1 mg per mL, and mix. Transfer 15.0 mL of this solution and 5.0 mL of *Internal standard solution* to a 100-mL volumetric flask, dilute with methanol to volume, and mix.

**Assay preparation**—Weigh and mix the contents of not fewer than 20 Capsules. Transfer an accurately weighed portion of the mixture, equivalent to about 15 mg of diazepam, to a 100-mL volumetric flask. Add 5.0 mL of *Internal standard solution* and about 45 mL of methanol. Shake by mechanical means for 30 minutes, dilute with methanol to volume, and mix. Centrifuge about 30 mL of this solution for 5 minutes, and filter.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The tailing factor for diazepam is not more than 2.0; and the relative standard deviation for the diazepam peak for replicate injections is not more than 2.0%. [NOTE—For the purpose of identification, the relative retention times are about 0.5 for ethylparaben and 1.0 for diazepam.] Calculate the quantity, in mg, of diazepam ( $C_{16}H_{13}ClN_2O$ ) in the portion of Capsules taken by the formula:

$$100C(R_U / R_S)$$

in which C is the concentration, in mg per mL, of USP Diazepam RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazepam Injection

» Diazepam Injection is a sterile solution of Diazepam in a suitable medium. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{16}H_{13}ClN_2O$ .

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

#### USP Reference standards (11)—

USP Diazepam RS

USP Endotoxin RS

#### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**B:** Transfer a volume of Injection, equivalent to about 10 mg of diazepam, to a separator, add 20 mL of water, and shake. Add 20 mL of chloroform, and shake vigorously for 2 minutes. Filter the chloroform layer through about 5 g of anhydrous granular sodium sulfate into a beaker. Wash the sodium sulfate with 20 mL of chloroform, collecting the washing in the beaker. Evaporate the chloroform extract on a steam bath with the aid of a current of air to a volume of about 5 mL. Remove the beaker from the steam bath, and evaporate the chloroform extract with the aid of a current of air to dryness. Dissolve the residue in 20 mL of anhydrous ether, filter, and evaporate the filtrate to dryness using a current of air. Vigorously scrape the resulting oily film with a spatula, and dry in vacuum over phosphorus pentoxide at 60° for 4 hours: the IR absorption spectrum of a potassium bromide dispersion of the residue exhibits maxima only at the same wavelengths as that of a similar preparation of USP Diazepam RS.

**Bacterial endotoxins** (85)—It contains not more than 11.6 USP Endotoxin Units per mg of diazepam.

**pH** (791): between 6.2 and 6.9.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and water (65:35). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—[NOTE—Prepare fresh daily.] Prepare a solution of *p*-tolualdehyde in methanol containing about 0.3  $\mu$ L per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diazepam RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1 mg per mL. Transfer 5.0 mL of this solution to a 25-mL volumetric flask, add 5.0 mL of *Internal standard solution*, dilute with methanol to volume, and mix to obtain a *Standard preparation* having a known concentration of about 0.2 mg of USP Diazepam RS per mL.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 10 mg of diazepam, to a 50-mL volumetric flask. Pipet 10 mL of *Internal standard solution* into the flask, dilute with methanol to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 1.4 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the relative retention times are about 0.5 for *p*-tolualdehyde and 1.0 for diazepam, the tailing factor for the diazepam peak is not more than 2.5, the resolution,  $R$ , between the *p*-tolualdehyde and diazepam peaks is not less than 3.5, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (between 10  $\mu$ L and 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Cal-

culate the quantity, in mg, of  $C_{16}H_{13}ClN_2O$  in each mL of the Injection taken by the formula:

$$50C / V(R_U / R_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Diazepam RS in the *Standard preparation*,  $V$  is the volume, in mL, of Injection taken, and  $R_U$  and  $R_S$  are the ratios of the peak responses of diazepam to that of *p*-tolualdehyde obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazepam Tablets

» Diazepam Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diazepam ( $C_{16}H_{13}ClN_2O$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Diazepam RS

USP Nordazepam RS

7-Chloro-1,3-dihydro-5-phenyl-2*H*-1,4-benzodiazepin-2-one.

$C_{15}H_{11}ClN_2O$  270.72

### Identification—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

**B:** Accurately weigh an amount of Tablet mass, equivalent to 10 mg of diazepam, place in a 50-mL centrifuge tube, and add 2 mL of acetone. Place the centrifuge tube in an ultrasonic bath for 5 minutes, and centrifuge. Using 100  $\mu$ L of the supernatant as the test solution, 100  $\mu$ L of a solution of USP Diazepam RS in acetone containing 5 mg per mL as the Standard solution, and a solvent system consisting of equal volumes of ethyl acetate and *n*-heptane, proceed as directed in *Identification test B* under *Diazepam*. The specified result is observed.

### Dissolution (711)—

**Medium:** 0.1 N hydrochloric acid; 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{16}H_{13}ClN_2O$  dissolved by employing UV absorption at a wavelength of about 242 nm on filtered portions of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Diazepam RS in the same *Medium*.

**Tolerances**—Not less than 85% ( $Q$ ) of the labeled amount of  $C_{16}H_{13}ClN_2O$  is dissolved in 30 minutes.

**Uniformity of dosage units (905):** meet the requirements.

### Assay—

**Mobile phase, System suitability solution, Standard preparation, and Chromatographic system**—Prepare as directed in the *Assay* under *Diazepam*.

**Assay preparation**—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 10 mg of diazepam, to a 100-mL volumetric flask. Add about 50 mL of methanol, sonicate for 5 minutes, shake by mechanical means for 5 minutes, dilute with methanol to volume, mix, and filter, discarding the first few mL of the filtrate.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diazepam*. Calculate the quantity, in mg, of diazepam

( $C_{16}H_{13}ClN_2O$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Diazepam RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazoxide

$C_8H_7ClN_2O_2S$  230.67

2*H*-1,2,4-Benzothiadiazine, 7-chloro-3-methyl-, 1,1-dioxide. 7-Chloro-3-methyl-2*H*-1,2,4-benzothiadiazine 1,1-dioxide [364-98-7].

» Diazoxide contains not less than 97.0 percent and not more than 102.0 percent of  $C_8H_7ClN_2O_2S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers. Store at 25°, excursions permitted between 15° and 30°.

### USP Reference standards (11)—

USP Diazoxide RS

### Identification—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Loss on drying (731)**—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition (281):** not more than 0.1%.

### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of 0.01 M sodium 1-pentanesulfonate, methanol, and glacial acetic acid (80:20:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Transfer about 50 mg of hydrochlorothiazide to a 25-mL volumetric flask, add methanol to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diazoxide RS in methanol, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 1 mg per mL. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with a mixture of water and methanol (4:1) to volume, and mix to obtain a solution having a known concentration of about 50  $\mu$ g of USP Diazoxide RS per mL.

**Assay preparation**—Transfer about 50 mg of Diazoxide, accurately weighed, to a 50-mL volumetric flask, add methanol to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with a mixture of water and methanol (4:1) to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L11. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between the analyte

and internal standard peaks is not less than 5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. The relative retention times are about 0.4 for hydrochlorothiazide and 1.0 for diazoxide. Calculate the quantity, in mg, of  $C_8H_7ClN_2O_2S$  in the portion of Diazoxide taken by the formula:

$$C(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Diazoxide RS in the *Standard preparation*; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazoxide Capsules

» Diazoxide Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_8H_7ClN_2O_2S$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Diazoxide RS

**Identification**—

**A:** Place a portion of the contents of Capsules, equivalent to about 50 mg of diazoxide, in a suitable centrifuge tube, add 25 mL of 0.1 N sodium hydroxide, shake for 15 minutes, and centrifuge: the supernatant so obtained responds to the *Thin-layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (17:4:3) being used.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Dissolution** (711)—

**Medium:** pH 6.8 phosphate buffer (see under *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 1:** 100 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of  $C_8H_7ClN_2O_2S$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 268 nm of filtered portions of the solution under test in comparison with a solution of USP Diazoxide RS similarly prepared.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_8H_7ClN_2O_2S$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

**Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Prepare as directed in the *Assay* under *Diazoxide*.

**Assay preparation**—Remove, as completely as possible, the contents of not less than 20 Capsules, and weigh accurately. Mix the combined contents, and transfer an accurately weighed quantity of the powder, equivalent to about 100 mg of diazoxide, to a 100-mL volumetric flask, add 15 mL of water, and shake by mechanical means for 5 minutes. Add 60 mL of methanol, shake by mechanical means for 15 minutes, dilute with methanol to volume, and mix.

Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with a mixture of water and methanol (4:1) to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diazoxide*. Calculate the quantity, in mg, of  $C_8H_7ClN_2O_2S$  in the portion of Capsules taken by the formula:

$$2C(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Diazoxide RS in the *Standard preparation*, and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazoxide Injection

» Diazoxide Injection is a sterile solution of Diazoxide in Water for Injection, prepared with the aid of Sodium Hydroxide. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_8H_7ClN_2O_2S$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Diazoxide RS

USP Endotoxin RS

**Identification**—

**A:** A dilution of the Injection in methanol containing 1 mg of diazoxide per mL responds to the *Thin-layer Chromatographic Identification Test* (201), a solution of USP Diazoxide RS in methanol containing 1 mg per mL being used as the *Standard solution*. Develop the chromatogram with a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (17:4:3).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of diazoxide.

**pH** (791): between 11.2 and 11.9.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

**Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Prepare as directed in the *Assay* under *Diazoxide*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 45 mg of diazoxide, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with a mixture of water and methanol (4:1) to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diazoxide*. Calculate the quantity, in mg, of  $C_8H_7ClN_2O_2S$  in each mL of the Injection taken by the formula:

$$C / V(R_U / R_S)$$

in which C is the concentration, in  $\mu$ g per mL, of USP Diazoxide RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diazoxide Oral Suspension

» Diazoxide Oral Suspension contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diazoxide ( $C_8H_7ClN_2O_2S$ ).

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Diazoxide RS

### Identification—

**A:** Place a portion of Oral Suspension, equivalent to about 50 mg of diazoxide, in a 50-mL volumetric flask, add 30 mL of 0.1 N sodium hydroxide, shake for 30 minutes, dilute with 0.1 N sodium hydroxide to volume, and mix: the solution so obtained responds to the *Thin-Layer Chromatographic Identification Test* (201), a solvent system consisting of a mixture of ethyl acetate, methanol, and ammonium hydroxide (17:4:3) being used.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, both relative to the internal standard, as obtained in the *Assay*.

### Uniformity of dosage units (905)—

FOR ORAL SUSPENSION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

### Deliverable volume (698)—

FOR ORAL SUSPENSION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

### Assay—

*Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Diazoxide*.

*Assay preparation*—Transfer an accurately measured volume of freshly mixed Oral Suspension, equivalent to about 100 mg of diazoxide, to a 50-mL centrifuge tube, add 2 mL of water and 35 mL of methanol, shake for 15 minutes, and centrifuge for 5 minutes. Transfer the supernatant to a 200-mL volumetric flask. Repeat the extraction process two times, beginning with the addition of 2 mL of water, combine the extracts in the 200-mL volumetric flask, dilute with methanol to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 2.0 mL of *Internal standard solution*, dilute with a mixture of water and methanol (4:1) to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Diazoxide*. Calculate the quantity, in mg, of diazoxide ( $C_8H_7ClN_2O_2S$ ) in each mL of the Oral Suspension taken by the formula:

$$2(C/V)(R_U / R_S)$$

in which C is the concentration, in  $\mu\text{g}$  per mL, of USP Diazoxide RS in the *Standard preparation*; V is the volume, in mL, of Oral Suspension taken; and  $R_U$  and  $R_S$  are the peak response ratios obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dibucaine

$C_{20}H_{29}N_3O_2$  343.46

4-Quinolinecarboxamide, 2-butoxy-N-[2-(diethylamino)ethyl]-

2-Butoxy-N-[2-(diethylamino)ethyl]cinchoninamide [85-79-0].

» Dibucaine contains not less than 97.0 percent and not more than 102.5 percent of  $C_{20}H_{29}N_3O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

### USP Reference standards (11)—

USP Dibucaine Hydrochloride RS

### Identification—

**A:** The IR absorption spectrum of a mineral oil dispersion of it, previously dried, exhibits maxima only at the same wavelengths as that of a similar dispersion of the residue prepared by dissolving 30 mg of USP Dibucaine Hydrochloride RS in 5 mL of 0.5 N sodium hydroxide, extracting the resulting solution with 5 mL of ether, evaporating the ether, and drying the residue over phosphorus pentoxide.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range** (741): between 62.5° and 66.0°, determined after drying.

**Loss on drying** (731)—Dry it over phosphorus pentoxide for 16 hours: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Chromatographic purity**—Proceed as directed for *Chromatographic purity* under *Dibucaine Hydrochloride*, except to use a *Test solution* containing 36.2 mg of Dibucaine per mL: the principal spot obtained from the *Test solution* corresponds in  $R_f$  value, color, and intensity to that obtained from the *Standard solution*; the sum of the intensities of any secondary spots, if present in the chromatogram of the *Test solution*, corresponds to not more than 2.0% of that of the principal spot in the chromatogram of the *Standard solution* on the basis of comparison with the spots obtained from the *Comparison solutions*.

### Assay—

*Mobile phase*—Dissolve 1.20 g of sodium lauryl sulfate, 0.20 g of sodium acetate, and 2.0 mL of triethylamine in 300 mL of water. Adjust with glacial acetic acid to a pH of 5.6, add 700 mL of methanol, mix, and pass through a suitable filter having a 0.5- $\mu\text{m}$  or finer porosity. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Solvent mixture*—Prepare a mixture of methanol and water (70:30).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dibucaine Hydrochloride RS in *Solvent mixture* to obtain a solution having a known concentration of about 1 mg per mL. Pass through a suitable filter having a 0.5- $\mu\text{m}$  or finer porosity.

*Assay preparation*—Transfer about 90 mg of Dibucaine, accurately weighed, to a 100-mL volumetric flask, add *Solvent mixture* to volume, and mix. Pass through a suitable filter having a 0.5- $\mu\text{m}$  or finer porosity.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the column efficiency, determined from the analyte peak, is not less than 1500 theoretical plates; the tailing factor for the analyte peak is not more than 3.0; and the relative standard deviation for replicate injections is not more than 2%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of  $C_{20}H_{29}N_3O_2$  in the portion of Dibucaine taken by the formula:

$$(343.46/379.93)(100C)(r_U / r_S)$$

in which 343.46 and 379.93 are the molecular weights of dibucaine and dibucaine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Dibucaine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses of the dibucaine peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dibucaine Cream

» Dibucaine Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dibucaine ( $C_{20}H_{29}N_3O_2$ ) in a suitable cream base.

**Packaging and storage**—Preserve in collapsible tubes or in tight, light-resistant containers.

**USP Reference standards** <11>—  
USP Dibucaine Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>: meets the requirements.

**Assay**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay* under *Dibucaine*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dibucaine Hydrochloride RS in an amount of 0.1 N hydrochloric acid equivalent to 20% of the flask's volume, and dilute quantitatively, and stepwise if necessary, with methanol to obtain a solution having a known concentration of about 0.25 mg per mL.

**Assay preparation**—Weigh accurately a portion of Cream, equivalent to about 22 mg of dibucaine, transfer to a separator containing 25 mL of ether, and mix to dissolve. Extract successively with two 9-mL portions of 0.1 N hydrochloric acid, combining the extracts in a 100-mL volumetric flask. Extract the ether phase in the separator with 2 mL of water, collecting the aqueous extract in the 100-mL volumetric flask. Dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.5-µm or finer porosity.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the

quantity, in mg, of dibucaine ( $C_{20}H_{29}N_3O_2$ ) in the portion of Cream taken by the formula:

$$(343.46/379.93)(100C)(r_U / r_S)$$

in which 343.46 and 379.93 are the molecular weights of dibucaine and dibucaine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Dibucaine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the area responses of the dibucaine peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dibucaine Ointment

» Dibucaine Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dibucaine ( $C_{20}H_{29}N_3O_2$ ) in a suitable ointment base.

**Packaging and storage**—Preserve in collapsible tubes or in tight, light-resistant containers.

**USP Reference standards** <11>—  
USP Dibucaine Hydrochloride RS

**Identification**—The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>: meets the requirements.

**Assay**—

**Mobile phase and Chromatographic system**—Proceed as directed in the *Assay* under *Dibucaine*.

**Standard preparation**—Transfer about 55 mg of USP Dibucaine Hydrochloride RS, accurately weighed, to a 50-mL volumetric flask, add 24.0 mL of 0.1 N hydrochloric acid, and swirl to dissolve. Dilute with a mixture of methanol and 1.0 N hydrochloric acid (13:12) to volume, and mix. Transfer 10.0 mL of this solution to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.5-µm or finer porosity.

**Assay preparation**—Weigh accurately a portion of Ointment, equivalent to about 50 mg of dibucaine, transfer to a separator containing 50 mL of ether, and mix to dissolve. Extract successively with 50-mL, 40-mL, and 30-mL portions of 0.1 N hydrochloric acid, combining the extracts in a 250-mL volumetric flask. Dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.5-µm or finer porosity.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of dibucaine ( $C_{20}H_{29}N_3O_2$ ) in the portion of Ointment taken by the formula:

$$(343.46/379.93)(250C)(r_U / r_S)$$

in which 343.46 and 379.93 are the molecular weights of dibucaine and dibucaine hydrochloride, respectively; C is the concentration, in mg per mL, of USP Dibucaine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the area responses of the dibucaine peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dibucaine Hydrochloride

$C_{20}H_{29}N_3O_2 \cdot HCl$  379.92

4-Quinolinescarboxamide, 2-butoxy-*N*-[2-(diethylamino)ethyl]-, monohydrochloride.

2-Butoxy-*N*-[2-(diethylamino)ethyl]cinchoninamide monohydrochloride [61-12-1].

» Dibucaine Hydrochloride contains not less than 97.0 percent and not more than 100.5 percent of  $C_{20}H_{29}N_3O_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** (11)—

USP Dibucaine Hydrochloride RS

**Identification**—

**A:** *Infrared Absorption* (197M).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**C:** A solution of it responds to the tests for *Chloride* (191) when tested as specified for alkaloidal hydrochlorides.

**Loss on drying** (731)—Dry it at 80° for 5 hours: it loses not more than 2.0% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Chromatographic purity**—Dissolve a suitable quantity of Dibucaine Hydrochloride, accurately weighed, in chloroform to obtain a *Test solution* having a concentration of 40.0 mg per mL. Dissolve a suitable quantity of USP Dibucaine Hydrochloride RS, accurately weighed, in chloroform to obtain a *Standard solution* having a known concentration of about 40 mg per mL. Dilute portions of this solution quantitatively and stepwise with chloroform to obtain three *Comparison solutions* having concentrations of 40, 120, and 200 µg per mL (0.1%, 0.3%, and 0.5%) of the *Standard solution*, respectively. Apply separate 5-µL portions of the five solutions to the starting line of a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of a mixture of toluene, acetone, methanol, and ammonium hydroxide (50:30:5:1) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, mark the solvent front, and air-dry. Spray the plate heavily with a 1 in 200 solution of potassium dichromate in dilute sulfuric acid (1 in 5). Place the plate in an oven at 140° for 10 minutes, and view under short-wave-length UV light: the principal spot obtained from the *Test solution* corresponds in  $R_f$  value, color, and intensity to that obtained from the *Standard solution*; the sum of the intensities of any secondary spots, if present in the chromatogram of the *Test solution*, corresponds to not more than 1.0%, and the intensity of any secondary spot does not exceed 0.5% of that of the principal spot in the chromatogram of the *Standard solution* on the basis of comparison with the spots obtained from the *Comparison solutions*.

**Assay**—

*Mobile phase, Solvent mixture, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay under Dibucaine*.

*Assay preparation*—Transfer about 100 mg of Dibucaine Hydrochloride, accurately weighed, to a 100-mL volumetric flask, add *Solvent mixture* to volume, and mix. Pass through a suitable filter having a 0.5-µm or finer porosity.

*Procedure*—Proceed as directed for *Procedure* in the *Assay under Dibucaine*. Calculate the quantity, in mg, of

$C_{20}H_{29}N_3O_2 \cdot HCl$  in the portion of Dibucaine Hydrochloride taken by the formula:

$$100C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dibucaine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses of the dibucaine peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dibucaine Hydrochloride Injection

» Dibucaine Hydrochloride Injection is a sterile solution of Dibucaine Hydrochloride in Water for Injection. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dibucaine hydrochloride ( $C_{20}H_{29}N_3O_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, and protect from light.

**USP Reference standards** (11)—

USP Dibucaine Hydrochloride RS

USP Endotoxin RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** Place a volume of Injection, equivalent to about 30 mg of dibucaine hydrochloride, in a suitable evaporating dish, and concentrate on a steam bath to a volume of about 10 mL. Transfer the solution to a separator, render distinctly alkaline with 1 N sodium hydroxide, and extract with four 20-mL portions of ether. Wash the combined ether extracts with 5 mL of water, discarding the washing. Evaporate the ether extracts with the aid of a current of air to dryness, and dry the residue over phosphorus pentoxide for 3 hours: the dibucaine so obtained melts between 62° and 65°.

**Bacterial endotoxins** (85)—It contains not more than 35.7 USP Endotoxin Units per mg of dibucaine hydrochloride.

**pH** (791): between 4.5 and 7.0.

**Particulate matter** (788): meets the requirements for small-volume injections.

**Other requirements**—It meets the requirements under *Injections* (1).

**Assay**—

*Mobile phase and Chromatographic system*—Proceed as directed in the *Assay under Dibucaine*.

*Standard preparation*—Transfer about 50 mg of USP Dibucaine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add an accurately measured volume of water, equivalent to the volume of Injection taken to prepare the *Assay preparation*, dilute with methanol to volume, and mix. Where the *Assay preparation* is prepared in a 50-mL volumetric flask, transfer about 25 mg of USP Dibucaine Hydrochloride RS, accurately weighed, to a 100-mL volumetric flask, add an accurately measured volume of water, equivalent to twice the volume of Injection taken to prepare the *Assay preparation*, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.5-µm or finer porosity.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of dibucaine, to a 100-mL volumetric flask. Dilute with methanol to volume, and mix. Where the Injection is labeled to contain 1 mg or less of dibucaine hydrochloride per mL, transfer an accurately measured volume of Injection, equivalent to about 13 mg of dibucaine hydrochloride, to a 50-mL volumetric flask, dilute with methanol to volume, and mix. Pass through a suitable filter having a 0.5- $\mu$ m or finer porosity.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L, or 20  $\mu$ L where the concentration of dibucaine hydrochloride is about 0.25 mg per mL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the quantity, in mg, of dibucaine hydrochloride ( $C_{20}H_{29}N_3O_2 \cdot HCl$ ) in each mL of the Injection taken by the formula:

$$C(v/V)(r_u/r_s)$$

in which C is the concentration, in mg per mL, of USP Dibucaine Hydrochloride RS in the *Standard preparation*; v is the volume, in mL, of the *Assay preparation*; V is the volume, in mL, of Injection taken; and  $r_u$  and  $r_s$  are the area responses of the dibucaine peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dichloralphenazone

$C_{15}H_{18}Cl_6N_2O_5$  519.03

1,2-Dihydro-1,5-dimethyl-2-phenyl-3H-pyrazol-3-one, compound with 2,2,2-trichloro-1,1-ethanediol (1:2).

Antipyrine, compound with chloral hydrate (1:2) [480-30-8].

» Dichloralphenazone contains not less than 97.0 percent and not more than 100.5 percent of  $C_{15}H_{18}Cl_6N_2O_5$ , determined by both *Assay procedures*.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Dichloralphenazone RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** Dissolve 0.1 g of it in 10 mL of water containing 0.1 g of sodium nitrite, and add 1 mL of 2 N sulfuric acid: a green color is produced.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method II** (231): 0.001%.

**Assay**—Perform the following determinations.

**Assay procedure 1**—Transfer about 1500 mg of Dichloralphenazone, accurately weighed, to a beaker, add 10 mL of water and 20.0 mL of 0.5 N sodium hydroxide VS. Allow to stand for 2 minutes, and titrate with 0.5 N sulfuric acid VS to a colorless phenolphthalein endpoint. Titrate this neutralized solution with 0.1 N silver nitrate VS, using potassium chromate TS as the indicator. To the volume of 0.5 N sulfuric acid used in the first titration add four-fifteenths of the volume of 0.1 N silver nitrate used in the second titration, and subtract the sum obtained from the volume of 0.5 N sodium hydroxide added. Each mL of 0.5 N sodium hydrox-

ide represented by the difference is equivalent to 129.8 mg of  $C_{15}H_{18}Cl_6N_2O_5$ .

**Assay procedure 2**—Transfer about 400 mg of Dichloralphenazone, accurately weighed, to a 125-mL conical flask, add 20 mL of a 1 in 10 solution of sodium acetate, and swirl to dissolve. Add 25.0 mL of 0.1 N iodine VS, and allow to stand in the dark for 20 minutes, gently swirling occasionally. Add 10 mL of chloroform, rinsing the walls of the flask, and swirl until the precipitate is dissolved. Titrate the excess iodine with 0.1 N sodium thiosulfate VS, adding 3 mL of starch TS as the endpoint is approached. Perform a blank titration (see *Residual Titrations* under *Titrimetry* (541)). The difference between the titrations represents the amount of iodine consumed. Each mL of 0.1 N iodine consumed is equivalent to 25.95 mg of  $C_{15}H_{18}Cl_6N_2O_5$ .

**Calculation**—The difference between the percentages calculated from *Assay procedure 1* and *Assay procedure 2* is not more than 1.5%.

## Dichlorphenamide

$C_6H_6Cl_2N_2O_4S_2$  305.16

1,3-Benzenedisulfonamide, 4,5-dichloro-

4,5-Dichloro-m-benzenedisulfonamide [120-97-8].

» Dichlorphenamide contains not less than 98.0 percent and not more than 101.0 percent of  $C_6H_6Cl_2N_2O_4S_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Dichlorphenamide RS

**Identification**—

**A:** To 10 mL of a 1 in 10,000 solution in sodium hydroxide solution (1 in 2500) add 0.1 mL of hydrochloric acid: it exhibits absorption maxima at  $295 \pm 2$  nm and at  $286 \pm 2$  nm. The ratio  $A_{295} / A_{286}$  is between 0.90 and 1.00.

**B:** *Infrared Absorption* (197M).

**Melting range** (741): between  $236.5^\circ$  and  $240^\circ$ .

**Loss on drying** (731)—Dry it at a pressure not exceeding 5 mm of mercury at  $100^\circ$  to constant weight: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.2%.

**Chloride** (221)—To 100 mg add 25 mL of 8 N nitric acid, and warm on a steam bath to dissolve. Cool to room temperature: the solution shows no more chloride than corresponds to 0.28 mL of 0.020 N hydrochloric acid (0.20%).

**Selenium** (291): 0.003%, a 100-mg test specimen, mixed with 100 mg of magnesium oxide, being used.

**Heavy metals, Method II** (231): 0.001%.

**Assay**—

**Mobile solvent**—Prepare a suitable solution of 0.02 M monobasic sodium phosphate and 0.02 M dibasic sodium phosphate in acetonitrile and water (approximately 1:1) such that the retention time of Dichlorphenamide is approximately 6 minutes.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dichlorphenamide RS in *Mobile solvent* to obtain a solution containing about 1 mg per mL.

**Assay preparation**—Accurately weigh about 50 mg of Dichlorphenamide, and prepare as directed for *Standard preparation*.

**Procedure**—Introduce separately 20- $\mu$ L portions of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph (see *Chromatography* <621>) operated at 25°, by means of a suitable microsyringe or sampling valve, adjusting the operating parameters such that the peak obtained with the *Standard preparation* is full-scale. Typically, the apparatus is fitted with a 4-mm  $\times$  30-cm column, packed with packing L1, is equipped with an UV detector capable of monitoring absorption at 280 nm and a suitable recorder, and is capable of operating at a column pressure of up to 3500 psi. Five replicate injections of the *Standard preparation* show a relative standard deviation of not more than 1.5%. Calculate the quantity, in mg, of  $C_6H_6Cl_2N_2O_4S_2$  in the portion of Dichlorphenamide taken by the formula:

$$50C(A_U / A_S)$$

in which C is the concentration, in mg per mL, of USP Dichlorphenamide RS in the *Standard preparation*; and  $A_U$  and  $A_S$  are the area responses obtained at equivalent retention times from the *Assay preparation* and the *Standard preparation*, respectively.

## Dichlorphenamide Tablets

» Dichlorphenamide Tablets contain not less than 92.0 percent and not more than 108.0 percent of the labeled amount of  $C_6H_6Cl_2N_2O_4S_2$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
USP Dichlorphenamide RS

### Identification—

**A:** The polarogram of the solution employed for measurement in the *Assay* exhibits a half-wave potential ( $E_{1/2}$ ) within 1% of that of USP Dichlorphenamide RS, similarly measured ( $E_{1/2}$  is about  $-1.42$  volts against a saturated calomel electrode).

**B:** Fuse a quantity of powdered Tablets, equivalent to 200 mg of dichlorphenamide, with 1 pellet of sodium hydroxide: the ammonia fumes produced cause moistened red litmus paper to turn blue. The fusion mixture responds to the tests for *Sulfite* <191>.

### Dissolution <711>—

**Medium:** 0.1 M pH 8.0 phosphate buffer (see *Buffer Solutions* in the section *Reagents, Indicators, and Solutions*); 900 mL.

**Apparatus 2:** 75 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of  $C_6H_6Cl_2N_2O_4S_2$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 285 nm of filtered portions of the solution under test, suitably diluted with *Dissolution Medium* in comparison with a Standard solution having a known concentration of USP Dichlorphenamide RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_6H_6Cl_2N_2O_4S_2$  is dissolved in 60 minutes.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of dichlorphenamide, to a 50-mL

volumetric flask. Add about 40 mL of dimethylformamide, shake for 5 minutes to dissolve the dichlorphenamide, and add dimethylformamide to volume. Pipet 10 mL of this suspension into a 100-mL volumetric flask, add 25.0 mL of 0.1 N tetramethylammonium bromide, and dilute with water to volume. Transfer a portion of this solution to a polarographic cell that is immersed in a water bath regulated at 24.5° to 25.5°. Deaerate by bubbling purified nitrogen through the solution for 5 minutes. Insert the dropping mercury electrode of a suitable polarograph, and record the polarogram from  $-0.80$  volt to  $-1.80$  volts, using a saturated calomel electrode as the reference electrode, and a galvanometer having a sensitivity of about 5 microamperes full scale. Determine the height of the diffusion current at  $-1.65$  volts. Calculate the quantity, in mg, of  $C_6H_6Cl_2N_2O_4S_2$  in the portion of Tablets taken by the formula:

$$500C[(i_d)_U / (i_d)_S]$$

in which  $(i_d)_U$  is the observed diffusion current of the assay solution and  $(i_d)_S$  is that determined similarly in a solution of USP Dichlorphenamide RS the concentration of which is C mg per mL (about 100  $\mu$ g per mL).

## Diclazuril

$C_{17}H_9Cl_3N_4O_2$  407.64  
Benzeneacetonitrile, 2,6-dichloro- $\alpha$ -(4-chlorophenyl)-4-(4,5-dihydro-3,5-dioxo-1,2,4-triazin-2(3H)-yl)-;  
(p-Chlorophenyl)[2,6-dichloro-4-(4,5-dihydro-3,5-dioxo-*as*-triazin-2(3H)-yl)phenyl]acetonitrile [101831-37-2].

### DEFINITION

Diclazuril contains NLT 97.0% and NMT 101.0% of  $C_{17}H_9Cl_3N_4O_2$ , calculated on the dried basis.

### IDENTIFICATION

- **INFRARED ABSORPTION** <197K>

### ASSAY

#### • PROCEDURE

**Buffer:** Dissolve 6.3 g of ammonium formate in 800 mL of water, adjust with anhydrous formic acid to a pH of 4.0, and add 200 mL of water.

**Solution A:** Acetonitrile, water, and *Buffer* (3:15:2)

**Solution B:** Acetonitrile, water, and *Buffer* (85:5:10)

**Mobile phase:** See the gradient table below.

Time (min)	Solution A (%)	Solution B (%)
0	100	0
20	0	100
25	0	100
26	100	0
36	100	0

**Standard solution:** 0.5 mg/mL of USP Diclazuril RS in dimethylformamide

**System suitability solution:** 0.5 mg/mL of USP Diclazuril System Suitability Mixture RS in dimethylformamide

**Sample solution:** 0.5 mg/mL of Diclazuril in dimethylformamide

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

Mode: LC  
 Detector: UV 230 nm  
 Column: 4.6-mm × 10-cm; base-deactivated 3-μm packing L1  
 Flow rate: 1 mL/min  
 Column temperature: 35°  
 Injection size: 5 μL

**System suitability**

**Samples:** *Standard solution* and *System suitability solution*

**Suitability requirements**

**Resolution:** NLT 1.9 between diclazuril and diclazuril ketone peaks, *System suitability solution*

**Tailing factor:** NMT 1.4, *Standard solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the percentage of C<sub>17</sub>H<sub>9</sub>Cl<sub>3</sub>N<sub>4</sub>O<sub>2</sub> in the portion of Diclazuril taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Diclazuril RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Diclazuril in the *Sample solution* (mg/mL)

**Acceptance criteria:** 97.0%–101.0% on the dried basis

**IMPURITIES****Inorganic Impurities**

• **RESIDUE ON IGNITION** (281): NMT 0.1%

**Organic Impurities**

• **PROCEDURE 1: RESIDUAL SOLVENTS** (467)

Acceptance criteria: NMT 4000 ppm of *N,N*-dimethylformamide

• **PROCEDURE 2**

Buffer, Solution A, Solution B, Mobile phase, Standard solution, System suitability solution, Sample solution, and Chromatographic system: Proceed as directed in the Assay.

**Analysis**

**Samples:** *Standard solution* and *Sample solution*  
 Calculate the area percentage of each impurity, relative to diclazuril, in the portion of Diclazuril taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times (1/F) \times 100$$

$r_U$  = peak response of each impurity from the *Sample solution*  
 $r_S$  = peak response of diclazuril from the *Standard solution*  
 $C_S$  = concentration of USP Diclazuril RS in the *Standard solution* (mg/mL)  
 $C_U$  = concentration of Diclazuril in the *Sample solution* (mg/mL)  
 $F$  = relative response factor (see *Impurity Table 1*)

**Acceptance criteria**

[NOTE—Disregard any peak observed in the blank. The reporting level for impurities is 0.05%.]

**Individual impurities:** See *Impurity Table 1*.

**Total impurities:** NMT 1.5%

**Impurity Table 1**

Name	Relative Retention Time	Relative Response Factor	Acceptance Criteria, NMT (%)
6-Carboxylic acid <sup>a</sup>	0.62	0.85	0.50
6-Carboxamide <sup>b</sup>	0.80	0.92	0.50
Diclazuril	1.00	—	—
Ketone <sup>c</sup>	1.03	0.52	0.10
4-Amino derivative <sup>d</sup>	1.09	0.81	0.50
Des-cyano derivative <sup>e</sup>	1.16	1.1	0.50
Trichlorodiphenyl acetonitrile <sup>f</sup>	1.24	0.71	0.50
Any other individual impurity	—	1.0	0.20

<sup>a</sup> (RS)-2-[3,5-Dichloro-4-[(4-chlorophenyl)cyanomethyl]phenyl]-3,5-dioxo-2,3,4,5-tetrahydro-1,2,4-triazine-6-carboxylic acid.

<sup>f</sup> (RS)-2-(4-Chlorophenyl)-2-(2,6-dichlorophenyl)acetonitrile.

**SPECIFIC TESTS**

• **LOSS ON DRYING** (731): Dry a sample at between 100° and 105° under a vacuum for 4 h: it loses NMT 0.5% of its weight.

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in well-closed containers, and store at room temperature.

• **LABELING:** Label it to indicate that it is for veterinary use only.

• **USP REFERENCE STANDARDS** (11)

USP Diclazuril RS

USP Diclazuril System Suitability Mixture RS

Contains diclazuril and specified impurities.

**Diclofenac Potassium**

C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub> 334.24

Benzeneacetic acid, 2-[(2,6-dichlorophenyl)amino]-, monopotassium salt.

Potassium [o-(2,6-dichloroanilino)phenyl]acetate [15307-81-0].

» Diclofenac Potassium contains not less than 99.0 percent and not more than 101.0 percent of C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Diclofenac Potassium RS

USP Diclofenac Related Compound A RS

N-(2,6-Dichlorophenyl)indolin-2-one.

C<sub>14</sub>H<sub>9</sub>Cl<sub>2</sub>NO 278.14**Identification**—**A:** Infrared Absorption (197K).**B:** Ultraviolet Absorption (197U)—

Solution: 0.01 mg per mL.

Medium: methanol.

**C:** It meets the requirements of the flame test for Potassium (191).**pH** (791): between 7.0 and 8.5, in a 1% aqueous solution.**Loss on drying** (731)—Dry it at 105° under vacuum for 3 hours: it loses not more than 0.5% of its weight.**Heavy metals, Method II** (231): not more than 10 ppm.**Related compounds**—**pH 2.5 Phosphate buffer**—Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate components to a pH of 2.5 ± 0.2.**Mobile phase**—Prepare a filtered and degassed mixture of methanol and pH 2.5 Phosphate buffer (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).**Diluent**—Prepare a mixture of methanol and water (70:30).**Standard solution**—Prepare a solution of USP Diclofenac Related Compound A RS in methanol having a known concentration of about 0.25 mg per mL. Quantitatively dilute an accurately measured volume of this stock solution with *Diluent* to obtain a solution having a known concentration of about 1.5 µg per mL.**Resolution solution**—Prepare a solution in *Diluent* containing 40 µg per mL of diethyl phthalate, 0.5 mg per mL of USP Diclofenac Potassium RS, and 22.5 µg per mL of USP Diclofenac Related Compound A RS.**Test solution**—Transfer about 50 mg of Diclofenac Potassium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column that contains packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for diethyl phthalate, 0.7 for diclofenac related compound A, and 1.0 for diclofenac potassium; and the resolution, *R*, between diethyl phthalate and diclofenac related compound A is not less than 4.0. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5.0%.**Procedure**—Separately inject equal volumes (about 30 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of diclofenac related compound A in the portion of Diclofenac Potassium taken by the formula:

$$10(C/W)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Diclofenac Related Compound A RS in the *Standard solution*; *W* is the quantity, in mg, of Diclofenac Potassium taken to prepare the *Test solution*; and *r<sub>U</sub>* and *r<sub>S</sub>* are the diclofenac related compound A peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.1% of diclofenac related compound A is found. Cal-

culate the percentage of each other impurity in the portion of Diclofenac Potassium taken by the formula:

$$10(C/W)(r_i / r_S)$$

in which *r<sub>i</sub>* is the individual peak response of each impurity obtained from the *Test solution*; and the other terms are as defined above: not more than 0.1% of each individual impurity is found, and not more than 0.3% of total impurities is found.

**Assay**—Dissolve about 300 mg of Diclofenac Potassium, accurately weighed, in 50 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction (see *Titrimetry* (541)). Each mL of 0.1 N perchloric acid is equivalent to 33.424 mg of C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub>.

**Diclofenac Potassium Tablets**

» Diclofenac Potassium Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of diclofenac potassium (C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub>).

**Packaging and storage**—Preserve in tight, light-resistant containers, and store at controlled room temperature.

**USP Reference standards** (11)—

USP Diclofenac Potassium RS

USP Diclofenac Related Compound A RS

N-(2,6-Dichlorophenyl)indolin-2-one.

C<sub>14</sub>H<sub>9</sub>Cl<sub>2</sub>NO 278.14**Identification**—

**A:** The retention time of the diclofenac peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, as obtained in the *Assay*.

**B:** It meets the requirements of the flame test for Potassium (191).

**Dissolution** (711)—

**Medium:** simulated intestinal fluid (without enzyme); 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 60 minutes.

**Procedure**—Determine the amount of C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub> dissolved by employing UV absorption at the wavelength of maximum absorbance at about 276 nm on portions of the solution under test passed through a 0.45-µm filter, suitably diluted with *Medium*, if necessary, in comparison with a *Standard solution* having a known concentration of USP Diclofenac Potassium RS in the same *Medium*. Calculate the percentage of diclofenac potassium (C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub>) dissolved by the formula:

$$\frac{A_U \times C_S \times 900 \times 100}{A_S \times LC}$$

in which *A<sub>U</sub>* and *A<sub>S</sub>* are the absorbances obtained from the solution under test and the *Standard solution*, respectively; *C<sub>S</sub>* is the concentration, in mg per mL, of the *Standard solution*; 900 is the volume, in mL, of *Medium*; 100 is the conversion factor to percentage; and *LC* is the Tablet label claim, in mg, of diclofenac potassium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of C<sub>14</sub>H<sub>10</sub>Cl<sub>2</sub>KNO<sub>2</sub> is dissolved in 60 minutes.

**Uniformity of dosage units:** meets the requirements.

**Related compounds—**

*pH 2.5 Phosphate buffer, Mobile phase, Diluent, Resolution solution, and Chromatographic system*—Prepare as directed in the Assay.

**Standard solution**—Dissolve an accurately weighed quantity of USP Diclofenac Related Compound A RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 2.5 µg per mL.

**Test solution**—Use the Assay preparation.

**Procedure**—Separately inject equal volumes (about 30 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses. Calculate the percentage of diclofenac related compound A relative to the diclofenac potassium labeled content in the portion of Tablets taken by the formula:

$$100 \times 0.001 (C_A / C_T) (r_U / r_S)$$

in which 0.001 is a conversion coefficient from µg per mL to mg per mL;  $C_A$  is the concentration, in µg per mL, of diclofenac related compound A in the *Standard solution*;  $C_T$  is the concentration, in mg per mL, of diclofenac potassium in the *Test solution*, based on the label claim; and  $r_U$  and  $r_S$  are the diclofenac related compound A peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.5% of diclofenac related compound A is found. Calculate the percentage of each of the other impurities, other than diethyl phthalate, if present, relative to the diclofenac potassium labeled content in the portion of Tablets taken by the formula:

$$100 \times 0.001 (C_A / C_T) (r_i / r_S)$$

in which  $r_i$  is the response of an individual impurity peak obtained from the *Test solution*, and the other terms are as defined above: not more than 0.5% of each individual impurity is found, and not more than 1.5% of total impurities is found.

**Assay—**

*pH 2.5 Phosphate buffer*—Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate components to a pH of  $2.5 \pm 0.2$ .

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and *pH 2.5 Phosphate buffer* (70:30). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

*Diluent*—Prepare a mixture of methanol and water (70:30).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diclofenac Potassium RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, to obtain a solution having a known concentration of about 0.5 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 50 mg of diclofenac potassium, to a 100-mL volumetric flask. Add about 70 mL of *Diluent*, stir for 60 minutes, dilute with *Diluent* to volume, mix, and centrifuge.

**Resolution solution**—Prepare a solution in *Diluent* containing 40 µg per mL of diethyl phthalate, 0.5 mg per mL of USP Diclofenac Potassium RS, and 37.5 µg per mL of USP Diclofenac Potassium Related Compound A RS.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains 5-µm packing L7. The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses

as directed for *Procedure*: the resolution,  $R$ , between diethyl phthalate and diclofenac related compound A is not less than 2.5, and the resolution,  $R$ , between diclofenac related compound A and diclofenac is not less than 3.5. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the percentage of the labeled amount of diclofenac potassium ( $C_{14}H_{10}Cl_2KNO_2$ ) in the portion of the Tablets taken by the formula:

$$100 (C_S / C_U) (r_U / r_S)$$

in which  $C_S$  is the concentration, in mg per mL, of diclofenac potassium in the *Standard preparation*;  $C_U$  is the concentration, in mg per mL, of diclofenac potassium in the *Assay preparation*, based on the label claim; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diclofenac Sodium

$C_{14}H_{10}Cl_2NNaO_2$  318.13

Benzeneacetic acid, 2-[(2,6-dichlorophenyl)amino]-, monosodium salt.

Sodium [o-(2,6-dichloroanilino)phenyl]acetate  
[15307-79-6].

» Diclofenac Sodium contains not less than 99.0 percent and not more than 101.0 percent of  $C_{14}H_{10}Cl_2NNaO_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers.

**USP Reference standards** <11>—

USP Diclofenac Sodium RS

USP Diclofenac Related Compound A RS

N-(2,6-Dichlorophenyl)indolin-2-one.

$C_{14}H_9Cl_2NO$  278.14

**Identification—**

**A:** *Infrared Absorption* <197K>.

**B:** The retention time of the diclofenac peak in the chromatogram of the *Test solution* corresponds to that of the *Resolution solution* as obtained in the test for *Chromatographic purity*.

**C:** The residue obtained by igniting it responds to the flame test for *Sodium* <191>.

**Color of solution**—A 1 in 20 solution of it in methanol is colorless to faintly yellow, and the absorbance of the solution, determined in a 1-cm cell at 440 nm, is not more than 0.050, methanol being used as the blank.

**Clarity of solution**—The solution prepared as directed under *Color of solution* is not significantly less clear than an equal volume of methanol contained in a similar vessel and examined similarly.

**pH** <791>: between 7.0 and 8.5, in a solution (1 in 100).

**Loss on drying** <731>—Dry it at  $105^\circ$  to  $110^\circ$  for 3 hours: it loses not more than 0.5% of its weight.

**Heavy metals, Method II** (231)—To prepare the *Test Preparation*, use a 100-mL borosilicate glass beaker or a quartz crucible. If the residue is not completely white after the ignition at 500° to 600°, add enough hydrogen peroxide to dissolve it, heat gently until dry, and ignite for 1 hour. Repeat the hydrogen peroxide treatment and ignition until the residue is completely white. Proceed as directed in *Test Preparation*, beginning with "Cool, add 4 mL of 6 N hydrochloric acid." The limit is 0.001%.

#### Chromatographic purity—

**pH 2.5 Phosphate buffer**—Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate component to a pH of  $2.5 \pm 0.2$ .

**Mobile phase**—Prepare a filtered and degassed mixture of methanol and pH 2.5 Phosphate buffer (700:300). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). [NOTE—Increasing the proportion of buffer increases resolution.]

**Diluent**—Prepare a mixture of methanol and water (70:30).

**Standard solution**—Prepare a solution of USP Diclofenac Related Compound A RS in methanol having a known concentration of about 0.75 mg per mL. Quantitatively dilute an accurately measured volume of this stock solution with *Diluent* to obtain a solution having a known concentration of about 1.5 µg per mL.

**Resolution solution**—Prepare a solution in *Diluent* containing 20 µg of diethyl phthalate, 7.5 µg of USP Diclofenac Related Compound A RS, and 0.75 mg of USP Diclofenac Sodium RS per mL.

**Test solution**—Transfer about 75 mg of Diclofenac Sodium, accurately weighed, to a 100-mL volumetric flask, dissolve in and dilute with *Diluent* to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 25-cm column containing packing L7 (end-capped). The flow rate is about 1 mL per minute. Chromatograph the *Resolution solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for diethyl phthalate, 0.6 for diclofenac related compound A, and 1.0 for diclofenac; and the resolution,  $R$ , between diethyl phthalate and diclofenac related compound A is not less than 2.2, and that between diclofenac related compound A and diclofenac is not less than 6.5. Chromatograph the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 5%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the peak responses over a period of 2.5 times the retention time of diclofenac. Calculate the percentage of diclofenac related compound A in the portion of Diclofenac Sodium taken by the formula:

$$10(C/W)(r_U/r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Diclofenac Related Compound A RS in the *Standard solution*;  $W$  is the quantity, in mg, of Diclofenac Sodium taken to prepare the *Test solution*; and  $r_U$  and  $r_S$  are the diclofenac related compound A peak responses obtained from the *Test solution* and the *Standard solution*, respectively: not more than 0.2% is found. Calculate the percentage of each other impurity in the portion of Diclofenac Sodium taken by the formula:

$$10(C/W)(r_i/r_S)$$

in which  $r_i$  is the response of an individual impurity peak obtained from the *Test solution*, and the other terms are as

defined above: not more than 0.2% of any individual impurity is found. The sum of all of the impurities found is not more than 0.5%.

**Assay**—Dissolve about 450 mg of Diclofenac Sodium, accurately weighed, in 25 mL of glacial acetic acid, and titrate with 0.1 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 31.81 mg of  $C_{14}H_{10}Cl_2NNaO_2$ .

## Diclofenac Sodium Delayed-Release Tablets

### DEFINITION

Diclofenac Sodium Delayed-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diclofenac sodium ( $C_{14}H_{10}Cl_2NNaO_2$ ).

### IDENTIFICATION

- **A.** The retention time of the diclofenac peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.
- **B. IDENTIFICATION TESTS—GENERAL, Sodium (191):** It meets the requirements of the flame test.

### ASSAY

#### • PROCEDURE

**Solution A:** Mix equal volumes of 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. If necessary, adjust with additional portions of the appropriate component to a pH of  $2.5 \pm 0.2$ .

**Mobile phase:** Methanol and *Solution A* (7:3)

[NOTE—Increasing the proportion of buffer increases resolution.]

**Diluent:** Methanol and water (7:3)

**System suitability solution:** 20 µg/mL of diethyl phthalate, 7.5 µg/mL of USP Diclofenac Related Compound A RS, and 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*

**Standard solution:** 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*

**Sample solution:** Transfer 20 Tablets to a volumetric flask of such capacity that when filled to volume, a concentration of 0.75 mg/mL of diclofenac sodium is obtained. Add *Diluent* to about 70% of the capacity of the flask, and shake by mechanical means for NLT 30 min to disintegrate the Tablets. Cool to room temperature, and dilute with *Diluent* to volume. Pass a portion of the solution through a filter of 0.5-µm or finer pore size, and use the filtrate as the *Sample solution*.

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L7 (end-capped)

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for diethyl phthalate, diclofenac related compound A, and diclofenac are 0.5, 0.6, and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.2 between the diethyl phthalate and diclofenac related compound A peaks; NLT 6.5 between the diclofenac related compound A and diclofenac peaks, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{10}Cl_2NNaO_2$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of diclofenac from the *Sample solution*  
 $r_S$  = peak response of diclofenac from the *Standard solution*  
 $C_S$  = concentration of USP Diclofenac Sodium RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- **DISSOLUTION** (711): Proceed as directed for *Procedure, Apparatus 1 and Apparatus 2, Delayed-Release Dosage Forms, Method B* to determine the amount of  $C_{14}H_{10}Cl_2NNaO_2$  dissolved.

**Acid stage**

**Medium:** 0.1 N hydrochloric acid; 900 mL

**Apparatus 2:** 50 rpm, paddles constructed of (or coated with) polytetrafluoroethylene being used

**Time:** 2 h

**Detector:** UV maxima at about 276 nm

**Standard solution:** Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask, add 10.0 mL of 0.1 N sodium hydroxide, and dilute with water to volume. Transfer 2.0 mL of this solution to a second 100-mL volumetric flask, dilute with a mixture of 0.1 N hydrochloric acid and 5 N sodium hydroxide (900:20) to volume, and mix. This *Standard solution* contains 13.6 µg/mL of USP Diclofenac Sodium RS.

**Sample solution:** At the end of 2 h, remove each Tablet, or the major portion thereof if the Tablet is not intact, from the individual vessels, and subject them to the test under *Buffer stage*. To the 0.1 N hydrochloric acid remaining in each vessel, add 20.0 mL of 5 N sodium hydroxide, and stir for 5 min.

**Buffer stage**

**Medium:** pH 6.8 phosphate buffer; 900 mL

**Apparatus 2:** 50 rpm

**Time:** 45 min

**Detector:** UV maxima at about 276 nm

**Solution A:** 76 mg/mL of tribasic sodium phosphate

**pH 6.8 phosphate buffer:** *Solution A* and 0.1 N hydrochloric acid (1:3), adjusted with 2 N hydrochloric acid or 2 N sodium hydroxide to a pH of  $6.8 \pm 0.05$ , if necessary

**Standard solution:** Transfer 68 mg of USP Diclofenac Sodium RS to a 100-mL volumetric flask. Add 10.0 mL of 0.1 N sodium hydroxide, dilute with water to volume, and mix. Transfer 3.0 mL of this solution to a 100-mL volumetric flask, dilute with *Buffer stage Medium* to volume, and mix. The final concentration is about 0.0204 mg/mL of diclofenac sodium.

**Sample solution:** Sample per *Dissolution* (711). Dilute with *Medium* to a concentration similar to that of the *Standard solution*.

**Tolerances:** NLT 75% (Q) of the labeled amount of  $C_{14}H_{10}Cl_2NNaO_2$  is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

**IMPURITIES****Organic Impurities**• **PROCEDURE**

*Solution A, Mobile phase, Diluent, System suitability solution, Sample solution, Chromatographic system,*

and **System suitability:** Proceed as directed in the *Assay*.

**Standard stock solution:** 0.8 mg/mL of USP Diclofenac Related Compound A RS in methanol

**Standard solution:** 4 µg/mL of USP Diclofenac Related Compound A RS from the *Standard stock solution* in *Diluent*

**Analysis:** Measure the peak responses over a period of 40 min.

Calculate the percentage of diclofenac related compound A in relation to the quantity of diclofenac sodium in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response of diclofenac related compound A from the *Sample solution*  
 $r_S$  = peak response of diclofenac related compound A from the *Standard solution*  
 $C_S$  = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

Calculate the percentage of each impurity other than diethyl phthalate, if present, in relation to the diclofenac sodium in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response for each impurity from the *Sample solution*  
 $r_S$  = peak response for each impurity from the *Standard solution*  
 $C_S$  = concentration of USP Diclofenac Related Compound A RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

**Acceptance criteria**

**Individual impurities:** NMT 0.5% of diclofenac related compound A; NMT 1.0% of any other individual impurity

**Total impurities:** NMT 1.5%

**ADDITIONAL REQUIREMENTS**

- **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.
- **USP REFERENCE STANDARDS** (11)  
 USP Diclofenac Sodium RS  
 USP Diclofenac Related Compound A RS  
 N-(2,6-Dichlorophenyl)indolin-2-one.  
 $C_{14}H_9Cl_2NO$  278.14

---

**Diclofenac Sodium Extended-Release Tablets**

---

**DEFINITION**

Diclofenac Sodium Extended-Release Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diclofenac sodium ( $C_{14}H_{10}Cl_2NNaO_2$ ).

**IDENTIFICATION**

- A.** The retention time of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

- B. THIN-LAYER CHROMATOGRAPHIC IDENTIFICATION TEST** (201)

**Standard solution:** 2.0 mg/mL of USP Diclofenac Sodium RS in methanol. [NOTE—Shake by mechanical means for 10 min before makeup to final volume.]

**Sample solution:** Equivalent to 2.0 mg/mL of diclofenac sodium from a portion of the powder (NLT 10 Tablets) in methanol. [NOTE—Sonicate for 10 min, and shake by mechanical means for 10 min before makeup to final volume. Centrifuge this solution, and use the clear supernatant.]

**Developing solvent system:** Methanol, toluene, and glacial acetic acid (8:12:0.1)

**ASSAY**

- PROCEDURE**

[NOTE—Protect the *Standard solution*, *System suitability solution*, and *Sample solution* from light.]

**Diluent:** Methanol and water (7:3)

**Buffer:** 0.01 M phosphoric acid and 0.01 M monobasic sodium phosphate. Adjust with appropriate component to a pH of 2.5.

**Mobile phase:** Methanol and *Buffer* (7:3)

**Standard solution:** 0.5 mg/mL of USP Diclofenac Sodium RS in *Diluent*

**Resolution solution:** 20 µg/mL of diethyl phthalate, 7.5 µg/mL of USP Diclofenac Related Compound A RS, and 0.75 mg/mL of USP Diclofenac Sodium RS in *Diluent*

**Sample solution:** Powder NLT 20 Tablets, and transfer a weighed portion of the powder, equivalent to 100 mg of diclofenac sodium, to a 200-mL volumetric flask, and add 150 mL of *Diluent*. Heat on a steam bath for 3–5 min, and sonicate for 20 min. Cool to room temperature, and dilute with *Diluent* to volume. Place the flask in an ice bath for 45 min, shaking occasionally to precipitate out any undissolved waxy material. Pass a portion of the chilled solution through a filter of 0.45-µm or finer pore size. Allow the filtrate to reach room temperature before using.

**Chromatographic system**

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L7

**Flow rate:** 1 mL/min

**Injection size:** 10 µL

**System suitability**

**Samples:** *Standard solution* and *Resolution solution*

[NOTE—The relative retention times for diethyl phthalate, diclofenac related compound A, and diclofenac are 0.5, 0.6, and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.2 between the diethyl phthalate and diclofenac related compound A peaks, and NLT 3.8 between the diclofenac related compound A and diclofenac peaks, *Resolution solution*

**Relative standard deviation:** NMT 2.0% for diclofenac, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{14}H_{10}Cl_2NNaO_2$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of diclofenac from the *Sample solution*

$r_S$  = peak response of diclofenac from the *Standard solution*

$C_S$  = concentration of USP Diclofenac Sodium RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of diclofenac sodium in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

**PERFORMANCE TESTS**

- DISSOLUTION (711)**

**Test 1**

**Medium:** 0.05 M phosphate buffer, pH 7.5; 900 mL

**Apparatus 2:** 50 rpm; use wire sinkers.

**Times:** 1, 5, 10, 16, and 24 h

**Detector:** UV 276 nm

**Standard solution:** USP Diclofenac Sodium RS in *Medium*

**Analysis:** Pass portions of the solution under test through a suitable filter. Dilute with *Medium*, if necessary, to a concentration similar to that of the *Standard solution*.

**Tolerances:** The percentages of the labeled amount of  $C_{14}H_{10}Cl_2NNaO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1	15%–35%
5	45%–65%
10	65%–85%
16	75%–95%
24	NLT 80%

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium, Apparatus, and Analysis:** Proceed as directed for *Dissolution Test 1*.

**Times:** 1, 2, 4, 6, and 10 h

**Tolerances:** The percentages of the labeled amount of  $C_{14}H_{10}Cl_2NNaO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
1	NMT 28%
2	20%–40%
4	35%–60%
6	50%–80%
10	NLT 65%

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium and Analysis:** Proceed as directed for *Dissolution Test 1*.

**Apparatus 1:** 100 rpm

**Times:** 2, 4, 8, and 16 h

**Tolerances:** The percentages of the labeled amount of  $C_{14}H_{10}Cl_2NNaO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
2	22%–42%
4	34%–61%
8	52%–82%
16	NLT 73%

**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium and Analysis:** Proceed as directed for *Test 1*.

**Apparatus 1:** 100 rpm

**Times:** 2, 4, 8, and 16 h

**Tolerances:** The percentages of the labeled amount of  $C_{14}H_{10}Cl_2NNaO_2$  dissolved at the times specified conform to *Acceptance Table 2*.

Time (h)	Amount Dissolved
2	20%–40%
4	35%–55%
8	60%–85%
16	NLT 85%

- **UNIFORMITY OF DOSAGE UNITS (905):** Meet the requirements

## IMPURITIES

### Organic Impurities

#### • PROCEDURE

**Diluent, Buffer, Mobile phase, Resolution solution, Sample solution, Chromatographic system, and System suitability:** Proceed as directed in the Assay.

**Standard stock solution:** 0.8 mg/mL of USP Diclofenac Related Compound A RS in *Diluent*

**Standard solution:** 4 µg/mL of USP Diclofenac Related Compound A RS, made by diluting a measured volume of *Standard stock solution* with *Diluent*

**System suitability solution:** 0.5 mg/mL of USP Diclofenac Sodium RS in *Diluent*

**System suitability**

**Samples:** *Resolution solution* and *System suitability solution*

[NOTE— The relative retention times for diethyl phthalate, diclofenac related compound A, and diclofenac are 0.5, 0.6, and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 2.2 between the diethyl phthalate and diclofenac related compound A peaks; and NLT 3.8 between the diclofenac related compound A and the diclofenac peaks, *Resolution solution*

**Standard deviation:** NMT 2.0% for the diclofenac peak, *System suitability solution*

**Analysis**

**Samples:** *Sample solution* and *Standard solution*

Calculate the percentage of each impurity in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response for any impurity from the *Sample solution*

$r_S$  = peak response for USP Diclofenac Related Compound A RS from the *Standard solution*

$C_S$  = concentration (mg/mL) of USP Diclofenac Related Compound A RS in the *Standard solution*

$C_U$  = concentration (mg/mL) of diclofenac sodium in the *Sample solution*

#### Acceptance criteria

Total impurities: NMT 1.5%

## ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Preserve in well-closed containers. Store at controlled room temperature, and protect from light.
- **LABELING:** When more than one *Dissolution* test is given, the labeling states the test used only if *Test 1* is not used.
- **USP REFERENCE STANDARDS (11)**
  - USP Diclofenac Sodium RS
  - USP Diclofenac Related Compound A RS
  - N*-(2,6-Dichlorophenyl)indolin-2-one.
  - $C_{14}H_9Cl_2NO$  278.14

## Dicloxacillin Sodium

$C_{19}H_{16}Cl_2N_3NaO_5S \cdot H_2O$  510.32

4-Thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid, 6-[[[3-(2,6-dichlorophenyl)-5-methyl-4-isoxazolyl]carbonyl]amino]-3,3-dimethyl-7-oxo-, monosodium salt, monohydrate, [2*S*-(2*α*,5*α*,6*β*)]-. Monosodium (2*S*,5*R*,6*R*)-6-[[3-(2,6-dichlorophenyl)-5-methyl-4-isoxazolecarboxamido]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate monohydrate [13412-64-1].

Anhydrous 492.32 [343-55-5].

» Dicloxacillin Sodium contains the equivalent of not less than 850 µg of dicloxacillin ( $C_{19}H_{17}Cl_2N_3O_5S$ ) per mg.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards (11)**—

USP Dicloxacillin Sodium RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** Ignite about 100 mg; a 1 in 20 solution of the residue in acetic acid responds to the tests for *Sodium* (191).

**Crystallinity** (695): meets the requirements.

**pH** (791): between 4.5 and 7.5, in a solution containing 10 mg per mL.

**Water, Method I** (921): between 3.0% and 5.0%.

**Dimethylaniline** (223): meets the requirement.

**Assay**—

**Diluent**—Dissolve 5.44 g of monobasic potassium phosphate in water to make 2000 mL of solution, and adjust with 8 N potassium hydroxide to a pH of  $5.0 \pm 0.1$ .

**Mobile phase**—Prepare a suitable filtered mixture of *Diluent* and acetonitrile (1500:500). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)). Increasing the acetonitrile concentration decreases the retention time of dicloxacillin.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dicloxacillin Sodium RS in *Diluent* to obtain a solution having a known concentration of about 1.1 mg per mL. [NOTE—Use this *Standard preparation* promptly, or refrigerate and use on the day prepared.]

**Assay preparation**—Transfer about 230 mg of Dicloxacillin Sodium, accurately weighed, to a 200-mL volumetric flask, add *Diluent* to volume, and mix. Stir with the aid of a magnetic stirrer for 5 minutes to ensure dissolution of the specimen. [NOTE—Use this *Assay preparation* promptly, or refrigerate and use on the day prepared.]

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 225-nm detector and a 4.6-mm  $\times$  25-cm column containing packing L1. The flow rate is about 2 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the capacity factor, *k'*, for dicloxacillin is between 4 and 11; the column efficiency is not less than 700 theoretical plates; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the area responses for the major peaks. Calculate the

quantity, in  $\mu\text{g}$ , of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ) in each mg of the Dicloxacillin Sodium taken by the formula:

$$200(CE / W)(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Dicloxacillin Sodium RS in the *Standard preparation*;  $E$  is the dicloxacillin equivalent, in  $\mu\text{g}$  per mg, of USP Dicloxacillin Sodium RS;  $W$  is the weight, in mg, of the portion of Dicloxacillin Sodium taken; and  $r_U$  and  $r_S$  are the dicloxacillin peak area responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dicloxacillin Sodium Capsules

» Dicloxacillin Sodium Capsules contain not less than 90.0 percent and not more than 120.0 percent of the labeled amount of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dicloxacillin Sodium RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for dicloxacillin, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained as directed in the *Assay*.

**Dissolution** (711)—

*Medium*: water; 900 mL.

*Apparatus 1*: 100 rpm.

*Time*: 30 minutes.

**Procedure**—Determine the amount of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ) by a suitable validated spectrophotometric analysis of a filtered portion of the solution under test, suitably diluted with *Dissolution Medium*, if necessary, in comparison with a Standard solution having a known concentration of USP Dicloxacillin Sodium RS in the same *Medium*.

**Tolerances**—Not less than 75% ( $Q$ ) of the labeled amount of  $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Water, Method I** (921): not more than 5.0%.

**Assay**—

*Diluent, Mobile phase, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Dicloxacillin Sodium*.

**Assay preparation**—Remove, as completely as possible, the contents of not fewer than 10 Capsules, and weigh. Mix, and transfer an accurately weighed portion of the powder, equivalent to about 200 mg of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ), to a 200-mL volumetric flask, dilute with *Diluent* to volume, and mix for 10 minutes with the aid of a magnetic stirrer. Filter about 25 mL of the resulting solution, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*. [NOTE—Use this *Assay preparation* promptly, or refrigerate and use on the day prepared.]

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Dicloxacillin Sodium*. Calculate the quantity, in mg, of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ) in the portion of Capsule contents taken by the formula:

$$0.2CE(r_U / r_S)$$

in which the terms are as defined therein.

## Dicloxacillin Sodium for Oral Suspension

» Dicloxacillin Sodium for Oral Suspension is a dry mixture of Dicloxacillin Sodium and one or more suitable buffers, colors, flavors, and preservatives. It contains not less than 90.0 percent and not more than 120.0 percent of the labeled amount of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Dicloxacillin Sodium RS

**Identification**—The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for dicloxacillin, the retention time of which corresponds to that exhibited in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**Uniformity of dosage units** (905)—

FOR SOLID PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698): meets the requirements.

**pH** (791): between 4.5 and 7.5, in the suspension constituted as directed in the labeling.

**Water, Method I** (921): not more than 2.0%.

**Assay**—

*Diluent, Mobile phase, and Chromatographic system*—Proceed as directed in the *Assay* under *Dicloxacillin Sodium*.

*Buffer*—Use *Buffer No. 1* (see *Phosphate Buffers and Other Solutions* under *Antibiotics—Microbial Assays* (81)).

**Standard preparation**—Transfer about 100 mg of USP Dicloxacillin Sodium RS, accurately weighed, to a 100-mL volumetric flask; add 20.0 mL of dimethylformamide, 5.0 mL of alcohol, and 20 mL of *Buffer*; and stir for 5 minutes with the aid of a magnetic stirrer. Dilute with *Buffer* to volume, and mix. [NOTE—Use this *Standard preparation* promptly, or refrigerate and use on the day prepared.]

**Assay preparation**—Constitute Dicloxacillin Sodium for Oral Suspension as directed in the labeling. Transfer an accurately measured volume of the constituted suspension, freshly mixed and free from air bubbles, equivalent to about 125 mg of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ), to a 200-mL flask. Add 20.0 mL of dimethylformamide and 5.0 mL of alcohol, and stir for 15 minutes. Add 50.0 mL of *Buffer*, and stir for an additional 15 minutes. Add another 50.0 mL of *Buffer*, and stir for a third period of 15 minutes. Centrifuge this mixture for 15 minutes, and filter about 30 mL of the supernatant, discarding the first 5 mL of the filtrate. Use the clear filtrate as the *Assay preparation*. [NOTE—Use this *Assay preparation* promptly, or refrigerate and use on the day prepared.]

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Dicloxacillin Sodium*. Calculate the quantity, in mg, of dicloxacillin ( $\text{C}_{19}\text{H}_{17}\text{Cl}_2\text{N}_3\text{O}_5\text{S}$ ) in each mL of the constituted Dicloxacillin for Oral Suspension taken by the formula:

$$(125 + V)(CE / 1000V)(r_U / r_S)$$

in which  $V$  is the volume, in mL, of constituted Dicloxacillin for Oral Suspension taken to prepare the *Assay preparation*; and the other terms are as defined therein.

## Dicyclomine Hydrochloride

$C_{19}H_{35}NO_2 \cdot HCl$  345.95

[Bicyclohexyl]-1-carboxylic acid, 2-(diethylamino)ethyl ester, hydrochloride.  
2-(Diethylamino)ethyl[bicyclohexyl]-1-carboxylate hydrochloride [67-92-5].

» Dicyclomine Hydrochloride contains not less than 99.0 percent and not more than 102.0 percent of  $C_{19}H_{35}NO_2 \cdot HCl$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Dicyclomine Hydrochloride RS

### Identification—

**A:** Infrared Absorption (197K).

**B:** Mix about 5 mL of a 1 in 500 solution of it with about 2 mL of 2 N nitric acid, and add about 2 mL of silver nitrate TS: a white precipitate is formed which is insoluble in nitric acid but soluble in a slight excess of 6 N ammonium hydroxide.

**Melting range**, Class I (741): between 169° and 174°.  
**pH** (791): between 5.0 and 5.5, in a solution (1 in 100).

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 1.0% of its weight.

**Readily carbonizable substances** (271)—Dissolve 500 mg in 5 mL of sulfuric acid: the solution has no more color than Matching Fluid D.

**Assay**—Dissolve about 600 mg of Dicyclomine Hydrochloride, accurately weighed, in 70 mL of glacial acetic acid, add 10 mL of mercuric acetate TS and 1 drop of crystal violet TS, and titrate with 0.1 N perchloric acid VS to a blue endpoint. Perform a blank determination, and make any necessary correction. Each mL of 0.1 N perchloric acid is equivalent to 34.60 mg of  $C_{19}H_{35}NO_2 \cdot HCl$ .

## Dicyclomine Hydrochloride Capsules

» Dicyclomine Hydrochloride Capsules contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Dicyclomine Hydrochloride RS

### Identification—

**A:** Transfer a portion of the contents of the Capsules, equivalent to about 100 mg of dicyclomine hydrochloride, to a separator containing 10 mL of water and 1 mL of hydrochloric acid. Extract the aqueous acid solution with two 30-mL portions of chloroform, transfer the chloroform extracts to a second separator containing 20 mL of water and 1 mL of sodium hydroxide solution (1 in 10), and shake. Filter the chloroform layer through anhydrous sodium sul-

fate into a suitable container, and add 3 mL of a freshly prepared 1 in 20 solution of acetyl chloride in anhydrous methanol, prepared by cautiously adding acetyl chloride dropwise to anhydrous methanol with stirring. Evaporate under reduced pressure at room temperature until the residue has been thoroughly dried: the IR absorption spectrum of a potassium bromide dispersion of the dicyclomine hydrochloride so obtained exhibits maxima and minima at the same wavelengths as that of a similar preparation of USP Dicyclomine Hydrochloride RS.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

Determine the amount of  $C_{19}H_{35}NO_2 \cdot HCl$  dissolved by employing the following method.

*Mobile phase*—Prepare as directed in the *Assay*.

*0.04 M Phosphate buffer, pH 7.5*—Dissolve 2.72 g of monobasic potassium phosphate in 450 mL of water, adjust with 10% sodium hydroxide to a pH of  $7.5 \pm 0.1$ , dilute with water to 500 mL, and mix.

*Buffer-acetonitrile mixture*—Prepare a mixture of 0.04 M Phosphate buffer, pH 7.5 and acetonitrile (1:1).

*Standard solution*—Prepare a solution in *Medium* having a known concentration of about 20 µg per mL of USP Dicyclomine Hydrochloride RS. Transfer 25.0 mL of this solution to a suitable flask, add 25.0 mL of the *Buffer-acetonitrile mixture*, and mix.

*Test solution*—Pass a portion of the solution under test through a 0.7-µm glass microfiber filter. Transfer 5.0 mL of the filtrate to a suitable flask, add 5.0 mL of the *Buffer-acetonitrile mixture*, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column containing 3.5-µm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard solution*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 250 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the amount, in mg, of  $C_{19}H_{35}NO_2 \cdot HCl$  dissolved.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{19}H_{35}NO_2 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*0.02 M Phosphate buffer, pH 7.5*—Dissolve 2.72 g of monobasic potassium phosphate in 900 mL of water, adjust with 10% sodium hydroxide to a pH of  $7.5 \pm 0.1$ , dilute with water to 1000 mL, and mix.

*Mobile phase*—Prepare a mixture of acetonitrile and 0.02 M Phosphate buffer, pH 7.5 (70:30), filter, and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Diluent*—Prepare a mixture of acetonitrile and water (70:30).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dicyclomine Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.4 mg per mL. [NOTE—This solution is stable for 2 days.]

*Assay preparation*—Remove, as completely as possible, the contents of not fewer than 20 Capsules, and mix the

contents. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of dicyclomine hydrochloride, to a 50-mL volumetric flask. Add 2.0 mL of water, and sonicate for at least 2 minutes to disperse the sample. Add 35 mL of acetonitrile, sonicate for at least 5 minutes, and shake by mechanical means for at least 30 minutes. Add 10 mL of water, allow the preparation to equilibrate to room temperature, then dilute with water to volume, and mix. Centrifuge, for at least 5 minutes, a portion of this solution in a 15-mL glass centrifuge tube. Use the clear supernatant.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 215-nm detector and a 4.6-mm × 15-cm column containing 3.5-μm packing L7. The flow rate is about 1.0 mL per minute. Chromatograph the *Standard preparation*, and record the responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 1.5; and the relative standard deviation for replicate injections is not more than 1.5%.

**Procedure**—Separately inject equal volumes (about 50 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ) in the portion of Capsules taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dicyclomine Hydrochloride RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the areas of the dicyclomine peak obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dicyclomine Hydrochloride Injection

» Dicyclomine Hydrochloride Injection is a sterile, isotonic solution of Dicyclomine Hydrochloride in Water for Injection. It contains not less than 93.0 percent and not more than 107.0 percent of the labeled amount of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass.

**USP Reference standards** <11>—

USP Dicyclomine Hydrochloride RS

USP Endotoxin RS

**Identification**—

**A:** Transfer a portion of Injection, equivalent to about 100 mg of dicyclomine hydrochloride, to a separator containing 10 mL of water and 1 mL of hydrochloric acid. Shake with 25 mL of ether, and discard the ether layer. Proceed as directed in *Identification test A* under *Dicyclomine Hydrochloride Capsules*, beginning with "Extract the aqueous acid solution."

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Bacterial endotoxins** <85>—It contains not more than 17.2 USP Endotoxin Units per mg of dicyclomine hydrochloride.

**Other requirements**—It meets the requirements under *Injections* <1>.

**Assay**—

0.02 M Phosphate buffer, pH 7.5, *Mobile phase*, *Diluent*, *Standard preparation*, and *Chromatographic system*—Prepare

as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*.

**Assay preparation**—Prepare a composite sample of at least 5 ampules or 2 vials. Transfer an accurately measured volume of the composite sample, equivalent to 20.0 mg of dicyclomine hydrochloride, into a 50-mL volumetric flask, and dilute with *Diluent* to volume.

**Procedure**—Proceed as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*. Calculate the quantity, in mg, of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ) in the portion of Injection taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dicyclomine Hydrochloride RS in the *Standard preparation*; and the other terms are as defined therein.

## Dicyclomine Hydrochloride Oral Solution

» Dicyclomine Hydrochloride Oral Solution contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Dicyclomine Hydrochloride RS

**Identification**—

**A:** Transfer a portion of the Oral Solution, equivalent to about 100 mg of dicyclomine hydrochloride, to a separator containing 10 mL of water and 1 mL of hydrochloric acid. Extract with two 30-mL portions of ether, and discard the ether. Proceed as directed in *Identification test A* under *Dicyclomine Hydrochloride Capsules*, beginning with "Extract the aqueous acid solution."

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Assay**—

0.02 M Phosphate buffer, pH 7.5, *Mobile phase*, and *Chromatographic system*—Prepare as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*.

**Diluent**—Prepare a mixture of 0.02 M Phosphate buffer, pH 7.5 and acetonitrile (65:35).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Dicyclomine Hydrochloride RS in *Diluent* to obtain a solution having a known concentration of about 0.1 mg per mL. [NOTE—This solution is stable for 2 days.]

**Assay preparation**—Using a "to contain" pipet, transfer an accurately measured volume of Oral Solution, equivalent to 10.0 mg of dicyclomine hydrochloride, to a 100-mL volumetric flask. Rinse the pipet with several small portions of *Diluent*, adding the rinsings to the volumetric flask. Dilute with *Diluent* to volume, and mix.

**Procedure**—Proceed as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*. Calculate the quantity, in mg, of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ) in the portion of Oral Solution taken by the formula:

$$100C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dicyclomine Hydrochloride RS in the *Standard preparation*; and the other terms are as defined therein.

## Dicyclomine Hydrochloride Tablets

» Dicyclomine Hydrochloride Tablets contain not less than 93.0 percent and not more than 107.0 percent of the labeled amount of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ).

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—  
USP Dicyclomine Hydrochloride RS

### Identification—

**A:** Transfer a portion of finely powdered Tablets, equivalent to about 100 mg of dicyclomine hydrochloride, to a separator containing 10 mL of water and 1 mL of hydrochloric acid. Proceed as directed in *Identification* test A under *Dicyclomine Hydrochloride Capsules*, beginning with "Extract the aqueous acid solution."

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

### Dissolution (711)—

*Medium:* 0.01 N hydrochloric acid; 500 mL.

*Apparatus 2:* 50 rpm.

*Time:* 45 minutes.

*Mobile phase, 0.04 M Phosphate buffer, pH 7.5, Buffer-acetonitrile mixture, Test solution, and Chromatographic system*—Proceed as directed for *Dissolution* under *Dicyclomine Hydrochloride Capsules*.

*Standard solution*—Prepare a solution in *Medium* having a known concentration of about 40 µg per mL of USP Dicyclomine Hydrochloride RS. Transfer 25.0 mL of this solution to a suitable flask, add 25.0 mL of the *Buffer-acetonitrile mixture*, and mix.

*Procedure*—Proceed as directed for *Dissolution* under *Dicyclomine Hydrochloride Capsules*.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{19}H_{35}NO_2 \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*0.02 M Phosphate buffer, pH 7.5, Mobile phase, Diluent, Standard preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*.

*Assay preparation*—Transfer not fewer than 20 Tablets to a tared container, and determine the average Tablet weight. Grind the Tablets to a fine powder using a glass mortar and pestle. Transfer an accurately weighed portion of the powder, equivalent to about 20 mg of dicyclomine hydrochloride, to a 50-mL volumetric flask. Proceed as directed under *Dicyclomine Hydrochloride Capsules* beginning with "Add 2.0 mL of water."

*Procedure*—Proceed as directed in the *Assay* under *Dicyclomine Hydrochloride Capsules*. Calculate the quantity, in mg, of dicyclomine hydrochloride ( $C_{19}H_{35}NO_2 \cdot HCl$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Dicyclomine Hydrochloride RS in the *Standard preparation*; and the other terms are as defined therein.

## Didanosine

$C_{10}H_{12}N_4O_3$

236.23

Inosine, 2',3'-dideoxy-;

2',3'-Dideoxyinosine [69655-05-6].

### DEFINITION

Didanosine contains NLT 98.0% and NMT 102.0% of  $C_{10}H_{12}N_4O_3$ , calculated on the anhydrous basis.

### IDENTIFICATION

#### • A. INFRARED ABSORPTION (197K)

- **B.** The retention time of the major peak from the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

### ASSAY

#### • PROCEDURE

**Buffer:** 0.77 g/L of ammonium acetate in water

**Mobile phase:** Acetonitrile and *Buffer* (1:21)

**Standard solution:** 0.1 mg/mL of USP Didanosine RS in water

**Sample solution:** 0.1 mg/mL of Didanosine in water [NOTE—Mix for 1 h to dissolve completely before use.]

#### Chromatographic system

(See *Chromatography* (621), *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; packing L1

**Flow rate:** 2 mL/min

**Injection size:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time of didanosine is between 7 and 11 min.]

#### Suitability requirements

**Column efficiency:** NLT 6000 theoretical plates

**Tailing factor:** NMT 2.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of didanosine ( $C_{10}H_{12}N_4O_3$ ) in the portion of Didanosine taken:

$$\text{Result} = (r_U / r_S) \times (C_S / C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the anhydrous basis

### IMPURITIES

• **RESIDUE ON IGNITION** (281): NMT 0.2%

• **HEAVY METALS, Method II** (231): NMT 20 ppm

#### • RELATED COMPOUNDS

**Buffer:** Prepare as directed in the *Assay*.

**Diluent:** Adjust the pH of the *Buffer* with sodium hydroxide to 9. Prepare a mixture of acetonitrile and *Buffer* (1:19).

**Solution A:** Acetonitrile and *Buffer* (1:19)

**Solution B:** Acetonitrile and *Buffer* (1:3)

**System suitability solution:** 0.5 mg/mL of didanosine from USP Didanosine System Suitability Mixture RS in *Diluent*

**Standard stock solution A:** 0.05 mg/mL of USP Didanosine Related Compound A RS in *Diluent*

**Standard stock solution B:** 0.025 mg/mL of USP Didanosine RS in *Diluent*

**Standard stock solution C:** 0.025 mg/mL of USP Didanosine Related Compound B RS in *Diluent*

**Standard solution:** 5 µg/mL of USP Didanosine Related Compound A RS, 1.5 µg/mL of USP Didanosine RS, and 1.5 µg/mL of USP Didanosine Related Compound B RS from a mixture of *Standard stock solution A*, *Standard stock solution B*, and *Standard stock solution C*, respectively, diluted with *Diluent*

**Sample solution:** 0.5 mg/mL of Didanosine in *Diluent*

**Mobile phase:** See *Table 1*.

Table 1

Time (min)	Solution A (%)	Solution B (%)
0	100	0
15	100	0
20	0	100
30	0	100
35	100	0
45	100	0

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 2 mL/min

**Injection size:** 10 µL

#### System suitability

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—Didanosine elutes between 6 and 7.5 min; the relative retention times for didanosine, didanosine related compound A, and didanosine related compound B are 1.0, 0.28, and 2.11, respectively.]

#### Suitability requirements

**Resolution:** NLT 3.0 between didanosine and dideoxydideohydroinosine, *System suitability solution*

**Column efficiency:** NLT 6000 theoretical plates for dideoxydideohydroinosine, *System suitability solution*

**Relative standard deviation:** NMT 2.0% for didanosine related compound A, *Standard solution*

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of didanosine related compound A in the portion of Didanosine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of didanosine related compound A from the *Sample solution*

$r_S$  = peak response of didanosine related compound A from the *Standard solution*

$C_S$  = concentration of USP Didanosine Related Compound A RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of didanosine in the *Sample solution* (mg/mL)

Calculate the percentage of all other impurities in the portion of Didanosine taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of each impurity in the *Sample solution*

$r_S$  = peak response for didanosine from the *Standard solution*

$C_S$  = concentration of USP Didanosine RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of the *Sample solution* (mg/mL)

**Acceptance criteria:** See *Table 2*.

Table 2

Name	Relative Retention Time	Acceptance Criteria, NMT (%)
Didanosine related compound A	0.28	0.5
Inosine	0.39	0.2
2'-Deoxyinosine	0.45	0.3
3'-Deoxyinosine	0.51	0.2
2',3'-Anhydroinosine	0.59	0.2
Dideoxydideohydroinosine	0.81	0.2
Didanosine	1.0	—
Didanosine related compound B	2.1	0.2
5'-Deoxydideoxyadenosine	3.1	0.2
Any other individual, unidentified impurity	—	0.1
Total impurities	—	1.0

#### SPECIFIC TESTS

##### • OPTICAL ROTATION, *Specific Rotation* <781S>

**Sample solution:** 10 mg/mL in water

**Acceptance criteria:** −28° to −24°, anhydrous

##### • WATER DETERMINATION, *Method I* <921>: NMT 2.0%

#### ADDITIONAL REQUIREMENTS

##### • PACKAGING AND STORAGE: Preserve in well-closed containers, and store at controlled room temperature.

##### • USP REFERENCE STANDARDS <11>

USP Didanosine RS

USP Didanosine Related Compound A RS

Hypoxanthine.

USP Didanosine Related Compound B RS

2',3'-Dideoxyadenosine.

USP Didanosine System Suitability Mixture RS

**Add the following:**

### ▲Didanosine Delayed-Release Capsules

#### DEFINITION

Didanosine Delayed-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ).

#### IDENTIFICATION

##### • A. The retention time of major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

##### • B. INFRARED ABSORPTION <197>

Use either methods described under *Infrared Absorption* <197A> or <197K>.

**Sample:** Empty the contents of a suitable number of Capsules, and grind to a fine powder.

#### ASSAY

##### • PROCEDURE

**Buffer:** 0.77 g/L of ammonium acetate in water and pass through a suitable membrane filter of 0.45-µm pore size

**Mobile phase:** Acetonitrile and *Buffer* (35:965)

**Diluent:** 34.8 g/L of dibasic potassium phosphate and adjust with phosphoric acid to a pH of 7.5. Use within two weeks of preparation.

**Standard solution:** 0.1 mg/mL of USP Didanosine RS in water

**Sample stock solution:** Nominally prepare a solution at 0.6 mg/mL to 2.0 mg/mL of didanosine as follows. Mix a composite of the Capsule contents from NLT 20 Capsules in a suitable container, weigh 1 Capsule fill weight, transfer to a suitable size volumetric flask, and add 50% of the final volume of *Diluent*. Stir, shake or sonicate to dissolve. Cool to room temperature, and dilute with *Diluent* to final volume.

**Sample solution:** Nominally 0.1 mg/mL of didanosine in *Diluent* from the *Sample stock solution* and use within 24 h

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 254 nm

**Column:** 4.6-mm × 25-cm; 5-μm packing L1

**Flow rate:** 2 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 1.5

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of didanosine from the *Sample solution*

$r_S$  = peak response of didanosine from the *Standard solution*

$C_S$  = concentration of USP Didanosine RS in the *Standard solution* (mg/mL)

$C_U$  = nominal concentration of didanosine in the *Sample solution* (mg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

- **DISSOLUTION** <711>: Proceed as directed for *Method B* under *Procedure*, *Apparatus 1*, *Apparatus 2*, and *Delayed-Release Dosage Forms*.

**Acid stage medium:** 0.1 N hydrochloric acid; 1000 mL

**Buffer 1:** 76 g/L of tribasic sodium phosphate in water

**Buffer stage medium:** 0.1 N hydrochloric acid and 0.2 M tribasic sodium phosphate (3:1). Adjust with phosphoric acid or 10 N sodium hydroxide to a pH of 6.8; 1000 mL

**Buffer 2:** 1.36 g/L of monobasic potassium phosphate in water

**Apparatus 1:** 100 rpm

#### Times

**Acid stage:** 2 h

**Buffer stage:** 45 min

**Mobile phase:** Acetonitrile and *Buffer 2* (2:98)

**Sample solution:** Run the *Acid stage*. After the time specified, withdraw a portion of the solution under test, and pass it through a suitable filter. To the filtrate, add a volume of 10 N sodium hydroxide equivalent to 1% of the filtrate volume. Raise the basket. Discard the *Acid stage medium* from the vessels. Rinse the vessel with water. Add the *Buffer stage medium* pre-warmed to the vessel. After the time specified, withdraw a portion of the solution under test and pass it through a suitable filter. Store the acid stage and buffer stage filtrates at 5°.

**Standard stock solution:** 0.8 mg/mL of USP Didanosine RS in water

**Didanosine related compound A standard stock solution:** 0.1 mg/mL of USP Didanosine Related Compound A RS in water

**Standard solution:** Accurately transfer portions of the *Standard stock solution* and the *Didanosine related compound A standard stock solution* to a volumetric flask, and dilute with water to volume to obtain a didanosine final concentration of  $(L/1000)$  mg/mL where  $L$  is the Capsule label claim in mg and 0.01 mg/mL of didanosine related compound A.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 270 nm

**Column:** 3.9-mm × 5-cm; 5-μm packing L7

**Flow rate:** 1 mL/min

**Sample temperature:** 5°

**Injection volume:** 10 μL

#### System suitability

**Sample:** *Standard solution*

#### Suitability requirements

**Tailing factor:** NMT 2.0 for both the didanosine and didanosine related compound A peaks

**Relative standard deviation:** NMT 2.0% for the didanosine peak and NMT 5.0% for the didanosine related compound A peak

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of didanosine as calculated based on response of didanosine related compound A released in the *Acid stage*:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times (M_{r1}/M_{r2}) \times V \times 100$$

Calculate the percentage of didanosine released in the *Buffer stage*:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times D \times V \times 100$$

$r_U$  = peak response from the *Sample solution*.

[NOTE—During the *Acid stage*, didanosine is converted to didanosine related compound A so the peak response is the hypoxanthine peak.]

$r_S$  = peak response from the *Standard solution*.

[NOTE—During the *Acid stage*, didanosine is converted to didanosine related compound A so the peak response is the hypoxanthine peak.]

$C_S$  = concentration of didanosine in the *Standard solution* (mg/mL)

$L$  = label claim (mg/Capsule)

$D$  = dilution factor of the *Sample solution*, if applicable

$M_{r1}$  = molecular weight of didanosine, 236.2

$M_{r2}$  = molecular weight of didanosine related compound A, 136.11

$V$  = volume of medium, 1000 mL

#### Tolerances

**Acid stage:** NMT 10% (Q) of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ) is dissolved in 2 h.

**Buffer stage:** NLT 80% (Q) of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ) is dissolved in 45 min.

- **UNIFORMITY OF DOSAGE UNITS** <905>: Meet the requirements

## Didanosine Tablets for Oral Suspension

### DEFINITION

Didanosine Tablets for Oral Suspension contain NLT 90.0% and NMT 110.0% of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ).

### IDENTIFICATION

- **A.** The retention time of the major peak in the Sample solution corresponds to that of the major peak in the Standard solution, as obtained in the Assay.

### ASSAY

#### PROCEDURE

**Buffer:** 0.77 g/L of ammonium acetate in water

**Mobile phase:** Methanol and Buffer (5:95)

**Standard solution:** 0.1 mg/mL of USP Didanosine RS in water. [NOTE—Use this solution within 24 h of preparation.]

**Sample stock solution:** Transfer NLT 5 crushed Tablets for Oral Suspension to a 500-mL volumetric flask. Dissolve in 250 mL of water, dilute with water to volume, and shake for about 10 min.

**Sample solution:** Nominally 0.1 mg/mL of didanosine from the Sample stock solution diluted with water. [NOTE—Use this solution within 72 h of preparation. The Sample solution is stable for a longer time than the Standard solution because of the buffering agents in the Tablets for Oral Suspension.]

#### Chromatographic system

(See Chromatography (621), System Suitability.)

**Mode:** LC

**Detector:** UV 275 nm

**Columns**

**Guard:** Matching analytical column

**Analytical:** 4-mm × 12.5-cm; 5-μm packing L7

**Flow rate:** 2 mL/min

**Injection volume:** 20 μL

#### System suitability

**Sample:** Standard solution

[NOTE—The retention time of didanosine is more than 3.0 min.]

#### Suitability requirements

**Column efficiency:** NLT 2000 theoretical plates

**Relative standard deviation:** NMT 2.0%

#### Analysis

**Samples:** Standard solution and Sample solution

Calculate the percentage of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ) in the portion of Tablets for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the Sample solution

$r_S$  = peak response from the Standard solution

$C_S$  = concentration of USP Didanosine RS in the Standard solution (mg/mL)

$C_U$  = nominal concentration of didanosine in the Sample solution (mg/mL)

Acceptance criteria: 90.0%–110.0%

### PERFORMANCE TESTS

#### DISSOLUTION (711)

**Medium:** Water; 900 mL

**Apparatus 2:** 75 rpm

**Time:** 30 min

**Buffer and Mobile phase:** Proceed as directed in the Assay.

**Standard stock solution:** 0.8 mg/mL of USP Didanosine RS in Medium. [NOTE—This solution is stable for 48 h at 5°.]

**Standard solution:** Dilute the Standard stock solution in Medium to obtain a concentration of approximately (L/900), where L is the Tablet label claim.

**Sample solution:** Pass a portion of the solution under test through a suitable filter of 0.45-μm pore size.

**Chromatographic system:** Proceed as directed in the Assay, except disregard the Injection volume requirement, and use equal volumes of the Standard solution and Sample solution, equivalent to 2 μg of didanosine, as the injection volume, and no guard column is used.

#### System suitability

**Sample:** Standard solution

#### Suitability requirements

**Column efficiency:** NLT 1000 theoretical plates

**Tailing factor:** NMT 2

**Relative standard deviation:** NMT 2.0%.

[NOTE—Didanosine elutes at about 4.8 min.]

#### Analysis

**Samples:** Standard solution and Sample solution

Record the chromatograms for at least 7 min.

Calculate the percentage of didanosine ( $C_{10}H_{12}N_4O_3$ ) dissolved:

$$\text{Result} = (r_U/r_S) \times (C_S/L) \times V \times 100$$

$r_U$  = peak response of the Sample solution

$r_S$  = peak response of the Standard solution

$C_S$  = concentration of USP Didanosine RS in the Standard solution (mg/mL)

V = volume of Medium, 900 mL

L = label claim (mg/Tablet)

**Tolerances:** NLT 80% (Q) of the labeled amount of didanosine ( $C_{10}H_{12}N_4O_3$ ) is dissolved.

- **UNIFORMITY OF DOSAGE UNITS** (905): Meet the requirements

### IMPURITIES

#### ORGANIC IMPURITIES

**Buffer:** Proceed as directed in the Assay.

**Mobile phase:** Methanol and Buffer (1:99)

**Standard stock solution:** 0.125 mg/mL of USP Didanosine Related Compound A RS in water. [NOTE—Use this solution within 48 h of preparation.]

**Standard solution:** 1.5 μg/mL of USP Didanosine Related Compound A RS in water from Standard stock solution. [NOTE—Use this solution within 48 h of preparation of the Standard stock solution.]

**Sample stock solution:** Proceed as directed in the Assay.

**Sample solution:** Nominally 0.1 mg/mL from the Sample stock solution diluted with Mobile phase

**Chromatographic system:** Proceed as directed in the Assay, except use an Injection volume of 100 μL.

**Run time:** 30 min

#### System suitability

**Sample:** Standard solution

[NOTE—The retention time of didanosine related compound A is 1.5–2.5 min.]

**Suitability requirements****Column efficiency:** NLT 1000 theoretical plates**Relative standard deviation:** NMT 5.0%**Analysis****Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of didanosine related compound A in the portion of Tablets for Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

 $r_U$  = peak response from didanosine related compound A in the *Sample solution* $r_S$  = peak response from didanosine related compound A in the *Standard solution* $C_S$  = concentration of USP Didanosine Related Compound A RS in the *Standard solution* (mg/mL) $C_U$  = nominal concentration of didanosine in the *Sample solution* (mg/mL)

Calculate the percentage of any other impurity as follows:

$$\text{Result} = (r_U/r_T) \times 100$$

 $r_U$  = peak response from any other individual impurity in the *Sample solution* $r_T$  = sum of the responses from all the peaks in the *Sample solution*, including those of didanosine and didanosine related compound A**Acceptance criteria****Individual impurities:** NMT 0.7% of didanosine related compound A; NMT 0.2% of any other individual impurity**Total impurities:** NMT 1.2%, excluding didanosine related compound A**SPECIFIC TESTS**• **LOSS ON DRYING** (731)**Sample:** 4 Tablets for Oral Suspension**Analysis:** Dry the *Sample* at 130° for 16 h.**Acceptance criteria:** The Tablets for Oral Suspension lose NMT 6% of their weight.• **ACID-NEUTRALIZING CAPACITY** (301): NLT 17 mEq/Tablet**ADDITIONAL REQUIREMENTS**• **PACKAGING AND STORAGE:** Preserve in tight containers, and store between 15° and 30°.• **LABELING:** The label states that the Tablets are not to be swallowed whole, and that they may be chewed or dispersed in water before administration.• **USP REFERENCE STANDARDS** (11)

USP Didanosine RS

USP Didanosine Related Compound A RS

Hypoxanthine.

**Dienestrol** $C_{18}H_{18}O_2$  266.33Phenol, 4,4'-(1,2-diethylidene-1,2-ethanediyl)bis-, (E,E)-  
(E,E)-4,4'-(Diethylideneethylene)diphenol [84-17-3;  
13029-44-2].» Dienestrol contains not less than 98.0 percent and not more than 100.5 percent of  $C_{18}H_{18}O_2$ , calculated on the dried basis.**Packaging and storage**—Preserve in well-closed containers.**USP Reference standards** (11)—

USP Dienestrol RS

**Identification**—**A:** *Infrared Absorption* (197K).**B:** *Ultraviolet Absorption* (197U)—*Solution:* 5 µg per mL.*Medium:* alcohol.

Absorptivities at 228 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** To a solution of about 10 mg in 0.5 mL of alcohol add 1 mL of hydrochloric acid and about 50 mg of vanillin: a blue color is produced immediately, and it persists on dilution with water but disappears on the addition of alkali (*distinction from diethylstilbestrol, which produces no color*).**Melting range** (741): between 227° and 234°, but the range between beginning and end of melting does not exceed 3°.**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.**Residue on ignition** (281): not more than 0.2%.**Assay**—*Mobile phase, Internal standard solution, and Standard preparation*—Prepare as directed in the *Assay* under *Dienestrol Cream*.*Assay preparation*—Transfer about 25 mg of Dienestrol, accurately weighed, to a 100-mL volumetric flask. Add methanol to volume, and mix. Pipet 2 mL of this solution, 5 mL of *Internal standard solution*, and 5 mL of water into a 50-mL volumetric flask. Dilute with methanol to volume, and mix.*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Dienestrol Cream*. Calculate the quantity, in mg, of  $C_{18}H_{18}O_2$  in the portion of Dienestrol taken by the formula:

$$2.5C(R_U / R_S).$$

**Dienestrol Cream**» Dienestrol Cream is Dienestrol in a suitable water-miscible base. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{18}H_{18}O_2$ .**Packaging and storage**—Preserve in collapsible tubes or tight containers.**USP Reference standards** (11)—

USP Dienestrol RS

**Identification**—The chromatogram of the *Assay preparation* employed in the *Assay* exhibits two peaks, for dienestrol and the internal standard, whose retention times are identical to those exhibited by the *Standard preparation*.**Minimum fill** (755): meets the requirements.**Assay**—*Mobile phase*—Prepare a suitable degassed solution of methanol (about 3 in 5) such that the retention time of dienestrol is about 8 to 10 minutes and that of methyltestosterone is about 11 to 14 minutes. Make adjustments, if necessary (see *System Suitability* under *Chromatography* (621)).

**Internal standard solution**—Dissolve methyltestosterone in methanol to obtain a solution having a concentration of about 125 µg per mL.

**Standard preparation**—Accurately weigh a suitable quantity of USP Dienestrol RS, dissolve in methanol, and dilute quantitatively and stepwise with methanol to obtain a concentration of about 50 µg per mL. Pipet 10 mL of this solution, 5 mL of *Internal standard solution*, and 5 mL of water to a 50-mL volumetric flask, dilute with methanol to volume, and mix. The concentration of dienestrol in the *Standard preparation* is about 10 µg per mL.

**Assay preparation**—Pipet 20 mL of methanol and 5 mL of *Internal standard solution* into a 50-mL screw-capped tube. Using a 5-mL plastic syringe, transfer an accurately weighed quantity of Cream, equivalent to about 0.5 mg of dienestrol, to the tube. Cap the tube, and disperse the mixture with a suitable vibrating mixer at high speed for 3 minutes, then in an ultrasonic bath for 5 minutes. Add 20 mL of methanol, continue shaking by mechanical means for another 10 minutes, then chill in an ice bath for 5 minutes. Filter the mixture through paper, discarding the first 5 mL of the filtrate.

**Procedure**—Introduce equal volumes (about 50 µL) of the *Assay preparation* and the *Standard preparation* into a high-pressure liquid chromatograph operated at room temperature, by means of a suitable microsyringe or sampling valve. Typically, the apparatus is fitted with a 25-cm × 4.6-mm column containing packing L1 and equipped with an UV detector capable of monitoring absorption at 254 nm and a suitable recorder. The *Mobile phase* is maintained at a flow rate of about 2 mL per minute. In a suitable chromatographic system, six replicate injections of the *Standard preparation* show a relative standard deviation of not more than 2.0% and a resolution factor of not less than 2.0 between the peaks for dienestrol and the internal standard. Calculate the quantity, in mg, of dienestrol (C<sub>18</sub>H<sub>18</sub>O<sub>2</sub>) in the portion of Cream taken by the formula:

$$0.05C(R_U / R_S)$$

in which C is the concentration, in µg per mL, of USP Dienestrol RS in the *Standard preparation*, and  $R_U$  and  $R_S$  are the peak area ratios of dienestrol to methyltestosterone obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diethylcarbamazine Citrate

C<sub>10</sub>H<sub>21</sub>N<sub>3</sub>O · C<sub>6</sub>H<sub>8</sub>O<sub>7</sub> 391.42  
1-Piperazinecarboxamide, *N,N*-diethyl-4-methyl-, 2-hydroxy-1,2,3-propanetricarboxylate.  
*N,N*-diethyl-4-methyl-1-piperazinecarboxamide citrate (1:1).  
[1642-54-2].

» Diethylcarbamazine Citrate contains not less than 98.0 percent and not more than 102.0 percent of C<sub>10</sub>H<sub>21</sub>N<sub>3</sub>O · C<sub>6</sub>H<sub>8</sub>O<sub>7</sub>, calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diethylcarbamazine Citrate RS

**Identification**—

A: It meets the requirements under *Identification—Organic Nitrogenous Bases* (181).

B: It meets the requirements of the test for *Citrate* (191).

**Water**, *Method I* (921): not more than 0.5%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals** (231)—Dissolve 1.0 g in 20 mL of water. Add 1 mL of 0.1 N hydrochloric acid, dilute with water to 25 mL, and mix: the limit is 0.002%.

**Ordinary impurities** (466)—

*Test solution*: methanol.

*Standard solution*: methanol.

*Eluant*: a mixture of methanol and ammonium hydroxide (100:1.5).

*Visualization*: 16.

**Chromatographic purity**—

*Phosphate buffer*, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the *Assay*.

**Standard solution**—Prepare a solution of USP Diethylcarbamazine Citrate RS in *Phosphate buffer* having a known concentration of about 0.003 mg per mL.

**Test solution**—Transfer about 300 mg of Diethylcarbamazine Citrate, accurately weighed, to a 100-mL volumetric flask, add 100 mL of *Phosphate buffer*, and mix. Filter or centrifuge, and use the clear filtrate or supernatant.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of each impurity in the portion of Diethylcarbamazine Citrate taken by the formula:

$$10,000(C / W)(r_i / r_s)$$

in which C is the concentration, in mg per mL, of USP Diethylcarbamazine Citrate RS in the *Standard solution*; W is the weight, in mg, of Diethylcarbamazine Citrate taken to prepare the *Test solution*;  $r_i$  is the peak response for each impurity obtained from the *Test solution*; and  $r_s$  is the peak response for diethylcarbamazine citrate obtained from the *Standard solution*. Not more than 0.1% of any individual impurity is found.

**Assay**—

**Phosphate buffer**—Dissolve 31.24 g of monobasic potassium phosphate in 1000 mL of water.

**Mobile phase**—Dissolve 10 g of monobasic potassium phosphate in 1000 mL of water. Prepare a filtered and degassed mixture of 900 mL of this solution and 100 mL of methanol.

**Standard preparation**—Transfer about 5 mg of USP Diethylcarbamazine Citrate RS, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Phosphate buffer* to volume, and mix.

**Assay preparation**—Transfer about 5 mg of Diethylcarbamazine Citrate, accurately weighed, to a 50-mL volumetric flask, dissolve in and dilute with *Phosphate buffer* to volume, and mix.

**Chromatographic system**—The liquid chromatograph is equipped with a 220-nm detector and a 3.9-mm × 15-cm column that contains 5-µm packing L1. The flow rate is about 0.8 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of  $C_{10}H_{21}N_3O \cdot C_6H_8O_7$  in the portion of Diethylcarbamazine Citrate taken by the formula:

$$50C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Diethylcarbamazine Citrate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diethylcarbamazine Citrate Tablets

» Diethylcarbamazine Citrate Tablets contain not less than 95.0 percent and not more than 105.0 percent of the labeled amount of diethylcarbamazine citrate ( $C_{10}H_{21}N_3O \cdot C_6H_8O_7$ ).  
NOTE—Diethylcarbamazine Citrate Tablets labeled solely for veterinary use are exempt from the requirements of the test for *Dissolution*.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diethylcarbamazine Citrate RS

**Identification**—Tablets meet the requirements under *Identification*—Organic Nitrogenous Bases (181).

**Disintegration** (701)—

FOR TABLETS LABELED SOLELY FOR VETERINARY USE: 30 minutes.

**Dissolution**, *Procedure for a Pooled Sample* (711)—

*Medium*: water; 900 mL.

*Apparatus 2*: 50 rpm.

*Time*: 45 minutes.

*Procedure*—Determine the amount of  $C_{10}H_{21}N_3O \cdot C_6H_8O_7$  dissolved as directed in the *Assay*, preparing test solutions by quantitatively diluting filtered portions of the solution under test with phosphate buffer (1:1) containing 62.48 g of monobasic potassium phosphate in 1000 mL of water.

*Tolerances*—Not less than 75% (Q) of the labeled amount of  $C_{10}H_{21}N_3O \cdot C_6H_8O_7$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Chromatographic purity**—

*Phosphate buffer*, *Mobile phase*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Diethylcarbamazine Citrate*.

*Citric acid solution*—Prepare a solution of citric acid in *Phosphate buffer* containing 2 mg per mL.

*Standard solution*—Prepare a solution of USP Diethylcarbamazine Citrate RS in *Phosphate buffer* having a known concentration of about 0.003 mg per mL.

*Test solution*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg of diethylcarbamazine citrate, to a 100-mL volumetric flask, dilute with *Phosphate buffer* to volume, and mix. Filter or centrifuge, and use the clear filtrate or supernatant.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard solution*, the *Test solution*, and the *Citric acid solution* into the chromatograph, record the chromatograms, and measure the responses for all the peaks. Calculate the percentage of each impurity in the portion Tablets taken by the formula:

$$100(C/3)(r_i / r_S)$$

in which C is the concentration, in mg per mL, of USP Diethylcarbamazine Citrate RS in the *Standard solution*;  $r_i$  is the

peak response for each impurity obtained from the *Test solution*, disregarding any peak having a retention time corresponding to that of the main peak in the chromatogram obtained from the *Citric acid solution*; and  $r_S$  is the peak response obtained from the *Standard solution*. Not more than 0.1% of any individual impurity is found.

**Assay**—

*Phosphate buffer*, *Mobile phase*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Diethylcarbamazine Citrate*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of diethylcarbamazine citrate, to a 50-mL volumetric flask, dissolve in and dilute with *Phosphate buffer* to volume, and mix.

*Procedure*—Proceed as directed in the *Assay* under *Diethylcarbamazine Citrate*. Calculate the quantity, in mg, of diethylcarbamazine citrate ( $C_{10}H_{21}N_3O \cdot C_6H_8O_7$ ) in the portion of Tablets taken by the formula:

$$50C(r_U / r_S)$$

in which the terms are as defined therein.

## Diethylpropion Hydrochloride

$C_{13}H_{19}NO \cdot HCl$  241.76

1-Propanone, 2-(diethylamino)-1-phenyl-, hydrochloride.

2-(Diethylamino)propiophenone hydrochloride [134-80-5].

» Diethylpropion Hydrochloride contains not less than 97.0 percent and not more than 103.0 percent of  $C_{13}H_{19}NO \cdot HCl$ , calculated on the anhydrous basis. It may contain tartaric acid as a stabilizer.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**Labeling**—The label indicates whether it contains tartaric acid as a stabilizer.

**USP Reference standards** (11)—

USP Diethylpropion Hydrochloride RS

**Identification**—

A: *Infrared Absorption* (197K).

B: The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

C: A solution (1 in 100) responds to the tests for *Chloride* (191).

**Water**, *Method I* (921): not more than 0.5%.

**Secondary amines**—Dissolve 100 mg in 2 mL of methylene chloride in a centrifuge tube. Transfer to a second tube 2 mL of a *Standard solution* of diethylamine hydrochloride (dried at 105° for 2 hours before being used) in methylene chloride having a known concentration of 250  $\mu$ g per mL. Treat each solution as follows. Extract with 2 mL of a buffer solution containing 5.7 g of sodium carbonate and 3.0 g of sodium bicarbonate per 100 mL of water. Centrifuge, if necessary, to clarify the upper phase, and immediately transfer 0.5 mL of it to a spot plate. Immediately add 2 drops of acetaldehyde TS, and then, in rapid succession, add 1 drop of sodium nitroferrocyanide solution (1 in 100) to each spot.

Immediately and simultaneously stir both spots to mix the reagents: any blue color produced within 3 minutes by the test solution is not more intense than that of the Standard solution (not more than 0.5% of secondary amines as diethylamine hydrochloride).

**Free bromine**—One drop of a solution (1 in 10) produces no discoloration when placed upon starch iodide paper.

**Limit of hydrobromic acid and bromide**—To 10 mL of a solution (1 in 10) add 1 mL of sodium hydroxide solution (1 in 10), extract with about 25 mL of chloroform, and discard the chloroform extract. Add 1 mL of 6 N hydrochloric acid, 0.5 mL of chloroform, and 0.5 mL of freshly prepared chloramine T solution (1 in 10), and shake vigorously: no yellow or brown-red color is produced in the chloroform layer.

#### Chromatographic purity—

**Phosphate buffer**—Dissolve 136.1 g of monobasic potassium phosphate in 900 mL of water, add 3.2 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

**Diluent**—Prepare a mixture of water, Phosphate buffer, and acetonitrile (8:1:1).

**Mobile phase**—Mix 100 mL of acetonitrile, 100 mL of Phosphate buffer, 7.0 mL of diethylamine, and sufficient water to make 1 L. Filter, and degas before use. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Test preparation**—Transfer 100 mg of Diethylpropion Hydrochloride, accurately weighed, to a 50-mL volumetric flask, dissolve in about 40 mL of Diluent, add Diluent to volume, and mix.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diethylpropion Hydrochloride RS in Diluent, and dilute quantitatively, and stepwise if necessary, with Diluent to obtain a solution having a known concentration of about 0.01 mg per mL.

**System suitability solution**—Prepare a solution in Diluent containing about 25 µg of 2-ethylaminopropiophenone hydrochloride and 50 µg of USP Diethylpropion Hydrochloride RS per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 15-cm column that contains packing L11. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for 2-ethylaminopropiophenone and 1.0 for diethylpropion, and the resolution, *R*, between the 2-ethylaminopropiophenone and diethylpropion peaks is not less than 6.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 20 µL) of the *Standard preparation* and the *Test preparation* into the chromatograph, record the chromatograms, and measure the peak responses. The sum of all of the peak responses, excluding the solvent peak responses and the diethylpropion response, from the *Test preparation* is not greater than the diethylpropion response from the *Standard preparation* (0.5%).

#### Assay—

**Phosphate buffer**—Dissolve 136.1 g of monobasic potassium phosphate in 900 mL of water, add 4.3 mL of phosphoric acid, dilute with water to 1000 mL, and mix.

**Mobile phase**—Prepare a suitable mixture of water, acetonitrile, Phosphate buffer, and 1.0 M sodium nitrate (730:200:50:20), filter through a membrane filter (0.7-µm or finer porosity), and degas. Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diethylpropion Hydrochloride RS in *Mobile*

*phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 40 µg per mL.

**Assay preparation**—Transfer about 100 mg of Diethylpropion Hydrochloride, accurately weighed, to a 250-mL volumetric flask, dissolve in *Mobile phase*, dilute with *Mobile phase* to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability preparation**—Prepare a solution in *Mobile phase* containing about 200 µg of benzoic acid and 40 µg of USP Diethylpropion Hydrochloride RS per mL.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4-mm × 30-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.5 for diethylpropion hydrochloride and 1.0 for benzoic acid, and the resolution, *R*, between the diethylpropion hydrochloride and benzoic acid peaks is not less than 2.0. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>13</sub>H<sub>19</sub>NO · HCl in the portion of Diethylpropion Hydrochloride taken by the formula:

$$2.5C(r_u / r_s)$$

in which *C* is the concentration, in µg per mL, of USP Diethylpropion Hydrochloride RS in the *Standard preparation*, and *r<sub>u</sub>* and *r<sub>s</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diethylpropion Hydrochloride Tablets

» Diethylpropion Hydrochloride Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>13</sub>H<sub>19</sub>NO · HCl.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** <11>—  
USP Diethylpropion Hydrochloride RS

#### Identification—

**A:** The Tablets meet the requirements under *Identification*—*Organic Nitrogenous Bases* <181>.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

#### Dissolution <711>—

**Medium:** water; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 45 minutes.

**Procedure**—Determine the amount of C<sub>13</sub>H<sub>19</sub>NO · HCl dissolved from UV absorbances at the wavelength of maximum absorbance at about 253 nm of filtered portions of the solution under test, suitably diluted with 0.1 N hydrochloric acid, in comparison with a Standard solution having a known concentration of USP Diethylpropion Hydrochloride RS in the same medium.

**Tolerances**—Not less than 75% (Q) of the labeled amount of  $C_{13}H_{19}NO \cdot HCl$  is dissolved in 45 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Phosphate buffer, Mobile phase, and Chromatographic system*—Prepare as directed in the Assay under *Diethylpropion Hydrochloride*.

*Standard preparation*—Dissolve an accurately weighed quantity of USP Diethylpropion Hydrochloride RS in 0.1 N hydrochloric acid, and dilute quantitatively, and stepwise if necessary, with 0.1 N hydrochloric acid to obtain a stock solution having a known concentration of about 160  $\mu g$  per mL. Transfer 5.0 mL of this stock solution to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix to obtain a solution having a known concentration of about 8  $\mu g$  per mL.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 40 mg of diethylpropion hydrochloride, to a 250-mL volumetric flask. Add 200 mL of 0.1 N hydrochloric acid, and stir with the aid of a stir bar for 45 minutes. Remove the stir bar, dilute with 0.1 N hydrochloric acid to volume, mix, and filter, discarding the first 25 mL of the filtrate. Transfer 5.0 mL of the filtrate to a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix. If necessary, filter the solution through a 0.7- $\mu m$  porosity membrane filter.

*System suitability preparation*—Dissolve benzoic acid in 0.1 N hydrochloric acid to obtain a solution having a concentration of about 1 mg per mL. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, add 5.0 mL of the stock solution prepared as directed for the *Standard preparation*, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the Assay under *Diethylpropion Hydrochloride*. Calculate the quantity, in mg, of  $C_{13}H_{19}NO \cdot HCl$  in the portion of Tablets taken by the formula:

$$5C(r_U / r_S)$$

in which C is the concentration, in  $\mu g$  per mL, of USP Diethylpropion Hydrochloride RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diethylstilbestrol

$C_{18}H_{20}O_2$  268.35

Phenol 4,4'-(1,2-diethyl-1,2-ethenediyl)bis-, (E)-,  $\alpha, \alpha'$ -Diethyl-(E)-4,4'-stilbenediol [56-53-1].

» Diethylstilbestrol contains not less than 97.0 percent and not more than 100.5 percent of  $C_{18}H_{20}O_2$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers. Store at room temperature.

**USP Reference standards** (11)—

USP Diethylstilbestrol RS

**Identification**—

**A: Ultraviolet Absorption** (197U)—

*Solution*: 10  $\mu g$  per mL.

*Medium*: alcohol.

Absorptivities at 230 to 350 nm do not differ by more than 3.0%.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Melting range** (741): between 169° and 175°, but the range between beginning and end of melting does not exceed 4°.

**Acidity or alkalinity**—A solution of 100 mg in 5 mL of neutralized 70% alcohol is neutral to litmus.

**Loss on drying** (731)—Dry it at 105° for 2 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.05%.

**Assay**—

*Diluent*—Prepare a mixture of alcohol and water (1:1).

*Mobile phase*—Prepare a filtered and degassed mixture of methanol and water (3:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Diethylstilbestrol RS in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a known concentration of about 20  $\mu g$  per mL.

*System suitability solution*—Dissolve 10 mg of USP Diethylstilbestrol RS in 50 mL of chloroform, and allow the solution to stand in the dark for not less than 5 hours. Pipet 5.0 mL of this solution into a 50-mL volumetric flask, and evaporate to dryness under a current of air. Dissolve the residue (the *cis*- and *trans*-isomers of diethylstilbestrol) in *Diluent*, sonicating if necessary. Dilute with *Diluent* to volume, and mix.

*Assay preparation*—Dissolve an accurately weighed quantity of Diethylstilbestrol in *Diluent*, and dilute quantitatively, and stepwise if necessary, with *Diluent* to obtain a solution having a concentration of about 20  $\mu g$  per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *System suitability solution*, and record the peak responses as directed for *Procedure*: the relative retention times are about 1.00 for *trans*-diethylstilbestrol and 1.33 for *cis*-diethylstilbestrol; and the resolution,  $R$ , between *trans*-diethylstilbestrol and *cis*-diethylstilbestrol is not less than 4.0. Chromatograph the *Standard preparation*, and record the peak responses for the *trans*-isomer as directed for *Procedure*: the column efficiency is not less than 3000 theoretical plates; the tailing factor is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 50  $\mu L$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas of the peak responses for the *cis*- and *trans*-isomers of diethylstilbestrol. Calculate the quantity, in  $\mu g$ , of  $C_{18}H_{20}O_2$  in the portion of Diethylstilbestrol taken by the formula:

$$C(r_{t,U} + 1.26r_{c,U}) / (r_{t,S} + 1.26r_{c,S})$$

in which C is the concentration, in  $\mu g$  per mL, of USP Diethylstilbestrol RS in the *Standard preparation*; and  $r_{t,U}$  and  $r_{t,S}$  are the peak responses for the *trans*-isomer obtained from the *Assay preparation* and the *Standard preparation*, respectively; and  $r_{c,U}$  and  $r_{c,S}$  are the peak responses for the *cis*-isomer obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diethylstilbestrol Injection

» Diethylstilbestrol Injection is a sterile solution of Diethylstilbestrol in a suitable vegetable oil. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{18}H_{20}O_2$ .

**Packaging and storage**—Preserve in light-resistant, single-dose or multiple-dose containers, preferably of Type I glass.

### USP Reference standards (11)—

USP Diethylstilbestrol RS  
USP Endotoxin RS

**Identification**—The absorption spectrum, in the range of 250 to 450 nm, of the yellow solution obtained in the *Assay* after irradiation of the *Assay preparation* exhibits inflections only at the same wavelengths as that of the solution obtained after irradiation of the *Standard preparation*.

**Bacterial endotoxins** (85)—It contains not more than 0.7 USP Endotoxin Unit per mg of diethylstilbestrol.

**Other requirements**—It meets the requirements under *Injections* (1).

### Assay—

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diethylstilbestrol RS in alcohol, and dilute quantitatively and stepwise with alcohol to obtain a solution having a known concentration of about 20 µg per mL. Mix 25.0 mL of this solution with an equal volume of dibasic potassium phosphate solution (1 in 55).

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to not less than 1 mg and not more than 50 mg of diethylstilbestrol, to a 125-mL separator containing 75 mL of isooctane. Extract the solution with one 20-mL and two 10-mL portions of 1 N sodium hydroxide. Wash the combined alkaline extracts with two 10-mL portions of chloroform. Transfer the alkaline solution to a 150-mL beaker, and with the careful addition of 2.5 M phosphoric acid adjust the pH of the solution to 9.5. Transfer the adjusted solution, with the aid of a small volume of water, to a 125-mL separator, and extract with four 20-mL portions of chloroform. Filter the extracts into a 100-mL volumetric flask through a chloroform-wetted pledget of cotton, washing the filter with several small portions of chloroform to adjust the solution to volume. If necessary, dilute the solution quantitatively and stepwise with chloroform so that it contains about 10 µg of diethylstilbestrol per mL. Transfer 20 mL of this solution to a 50-mL conical flask, and evaporate with the aid of gentle heating in a current of air to about 5 mL. Complete the evaporation of the solvent in the air current without further application of heat. Dissolve the residue in 10.0 mL of alcohol, add 10.0 mL of dibasic potassium phosphate solution (1 in 55), and mix.

**Procedure**—[Caution—Protect the eyes from direct rays of UV light throughout this procedure.]

Transfer 4 mL of the *Standard preparation* to a stoppered, 1-cm quartz cell, place about 5 cm from a low-pressure, short-wave mercury lamp rated at from 2 to 20 watts, and irradiate for about 5 minutes. Place the cell in the sample compartment of a spectrophotometer, and measure the absorbance at the wavelength of maximum absorbance at about 418 nm, using water as the blank. Continue irradiation for successive 1- to 3-minute intervals, measuring at 418 nm until the maximum absorbance (about 0.7) has been obtained. If necessary, adjust the geometry of the irradiation apparatus so as to obtain maximum, reproducible absorbance at 418 nm. Similarly irradiate a 4-mL portion of the *Assay preparation*, recording the absorbance at 418 nm, at successive short intervals until maximum absorbance is obtained. Concomitantly determine the absorbances of the

*Assay preparation* and the *Standard preparation* in 1-cm cells at 418 nm, using water as the blank, and subtract these values from those for the respective irradiated solutions to obtain the corrected maximum absorbances. Calculate the quantity, in µg, of diethylstilbestrol ( $C_{18}H_{20}O_2$ ) in each mL of the *Assay preparation* taken by the formula:

$$C(A_U / A_S)$$

in which C is the concentration, in µg per mL, of USP Diethylstilbestrol RS in the *Standard preparation*, and  $A_U$  and  $A_S$  are the corrected maximum absorbances of the irradiated *Assay preparation* and *Standard preparation*, respectively.

## Diethylstilbestrol Tablets

» Diethylstilbestrol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{18}H_{20}O_2$ .

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards (11)—

USP Diethylstilbestrol RS

**Identification**—The Tablets respond to *Identification* test B under *Diethylstilbestrol*.

**Disintegration** (701): 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

### Assay—

*Diluent, Mobile phase, System suitability solution, Standard preparation, and Chromatographic system*—Proceed as directed in the *Assay* under *Diethylstilbestrol*.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 5 mg of diethylstilbestrol, to a 50-mL volumetric flask. Add about 35 mL of *Diluent*, and sonicate until the powder is dissolved (about 2 hours). Dilute with *Diluent* to volume, and mix. Allow the mixture to stand until a clear supernatant is obtained. Pipet 10.0 mL of the supernatant into a 50-mL volumetric flask, dilute with *Diluent* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diethylstilbestrol*. Calculate the quantity, in mg, of diethylstilbestrol ( $C_{18}H_{20}O_2$ ) in the portion of Tablets taken by the formula:

$$250C(r_{t,u} + 1.26r_{c,u}) / (r_{t,s} + 1.26r_{c,s})$$

in which the terms are as defined therein.

## Diethyltoluamide

$C_{12}H_{17}NO$  191.27

Benzamide, *N,N*-diethyl-3-methyl-,  
*N,N*-Diethyl-*m*-toluamide [134-62-3].

» Diethyltoluamide contains not less than 95.0 percent and not more than 103.0 percent of

the *meta*-isomer of  $C_{12}H_{17}NO$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diethyltoluamide RS

**Identification**, *Infrared Absorption* (197S): solution; *Assay preparation* versus *Standard preparation* in *Assay*, in spectral region between 8  $\mu m$  and 15  $\mu m$ .

**Specific gravity** (841): between 0.996 and 1.002.

**Refractive index** (831): between 1.520 and 1.524.

**Acidity**—Dissolve 10.0 g in 50 mL of neutralized alcohol, add phenolphthalein TS, and titrate with 0.010 N sodium hydroxide: not more than 4.0 mL of 0.010 N sodium hydroxide is required.

**Water**, *Method I* (921): not more than 0.5%.

**Assay**—Transfer about 200 mg of Diethyltoluamide, accurately weighed, to a 10-mL volumetric flask, dilute with carbon disulfide to volume, and mix to obtain the *Assay preparation*. Concomitantly determine the absorbances of the *Assay preparation* and of a *Standard preparation* of USP Diethyltoluamide RS in carbon disulfide having a known concentration of about 20 mg per mL in 1-mm cells at the wavelength of maximum absorbance at about 14.1  $\mu m$  and at the wavelength of minimum absorbance at about 14.4  $\mu m$ , with a suitable IR spectrophotometer, using carbon disulfide as the blank. Calculate the quantity, in mg, of the *meta*-isomer of  $C_{12}H_{17}NO$  in the Diethyltoluamide taken by the formula:

$$10C(A_{U14.1} - A_{U14.4}) / (A_{S14.1} - A_{S14.4})$$

in which C is the concentration, in mg per mL, of USP Diethyltoluamide RS in the *Standard preparation*, and  $A_U$  and  $A_S$  are the absorbances of the *Assay preparation* and the *Standard preparation*, respectively, at the wavelengths indicated by the subscripts.

## Diethyltoluamide Topical Solution

» Diethyltoluamide Topical Solution is a solution of Diethyltoluamide in Alcohol or Isopropyl Alcohol. It contains not less than 92.0 percent and not more than 108.0 percent of the labeled amount of the *meta*-isomer of  $C_{12}H_{17}NO$ .

If it contains Alcohol, not less than 95.0 percent and not more than 105.0 percent of the labeled amount of  $C_2H_5OH$  is present.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diethyltoluamide RS

**Identification**—It responds to the *Identification* test under *Diethyltoluamide*.

**Alcohol content** (if present) (611): between 29.0% and 89.0% of  $C_2H_5OH$ .

**Assay**—Transfer an accurately weighed quantity of Topical Solution, equivalent to about 200 mg of diethyltoluamide, to a beaker. Place the beaker in a vacuum oven containing silica gel and calcium chloride, and adjusted to a pressure of about 380 mm of mercury, and heat at 35° for 6 hours. Transfer the residue with the aid of carbon disulfide to a 10-mL volumetric flask, and carbon disulfide to volume, and mix. Transfer to a 10-mL volumetric flask about 200 mg of USP Diethyltoluamide RS, accurately weighed, add carbon disulfide to volume, and mix, to obtain the *Standard solu-*

*tion*. Concomitantly determine the absorbances of both solutions in 1-mm cells at the wavelength of maximum absorbance at about 14.1  $\mu m$  and at the wavelength of minimum absorbance at about 14.4  $\mu m$ , with a suitable IR spectrophotometer, using carbon disulfide as the blank. Calculate the quantity, in mg, of the *meta*-isomer of diethyltoluamide ( $C_{12}H_{17}NO$ ) in the portion of Topical Solution taken by the formula:

$$10C(A_{U14.1} - A_{U14.4}) / (A_{S14.1} - A_{S14.4})$$

in which C is the concentration, in mg per mL, of USP Diethyltoluamide RS in the *Standard solution*, and  $A_U$  and  $A_S$  are the absorbances of the solution from Diethyltoluamide Solution and the *Standard solution*, respectively, at the wavelengths indicated by the subscripts.

## Diflorasone Diacetate

$C_{26}H_{32}F_2O_7$  494.52

Pregna-1,4-diene-3,20-dione,17,21-bis(acetoxy)-6,9-difluoro-11-hydroxy-16-methyl-, (6 $\alpha$ ,11 $\beta$ ,16 $\beta$ )-.

6 $\alpha$ ,9-Difluoro-11 $\beta$ ,17,21-trihydroxy-16 $\beta$ -methylpregna-1,4-diene-3,20-dione 17,21-diacetate [33564-31-7].

» Diflorasone Diacetate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{26}H_{32}F_2O_7$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Diflorasone Diacetate RS

**Identification**, *Infrared Absorption* (197M).

**Specific rotation** (781S): between +58° and +68°.

*Test solution*: 20 mg, undried, per mL, in chloroform.

**Loss on drying** (731)—Dry it in vacuum at 60° and at a pressure not exceeding 5 mm of mercury for 16 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.5%.

**Chromatographic purity**—

*Mobile phase and Chromatographic system*—Prepare as directed in the *Assay*.

*Test solution*—Dissolve an accurately weighed quantity of Diflorasone Diacetate in water-saturated chloroform to obtain a solution having a concentration of about 6 mg per mL.

*Procedure*—Inject a volume (about 10  $\mu L$ ) of the *Test solution* into the chromatograph, record the chromatogram for a period equal to 5 times the retention time of the major peak, and measure the areas of all the peaks. Calculate the percentage of each impurity in the portion of Diflorasone Diacetate taken by the formula:

$$100(r_i / r_s)$$

in which  $r_i$  is the peak area for each impurity; and  $r_s$  is the sum of the areas of all the peaks: not more than 1.0% of any individual impurity is found; and not more than 2.0% of total impurities is found.

**Assay—**

**Mobile phase**—Prepare a solution containing a mixture of water-saturated *n*-butyl chloride, water-saturated methylene chloride, glacial acetic acid, and tetrahydrofuran (350:125:15:10). Make adjustments if necessary (see *System Suitability* under *Chromatography* <621>).

**Internal standard solution**—Using water-saturated chloroform, prepare a solution of isoflupredone acetate containing about 0.04 mg per mL.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diflorasone Diacetate RS in *Internal standard solution* to obtain a solution having a known concentration of about 33 µg per mL.

**Assay preparation**—Transfer about 15 mg of Diflorasone Diacetate, accurately weighed, to a 500-mL volumetric flask. Add *Internal standard solution* to volume, and mix.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm × 10-cm column that contains 3-µm packing L3. The flow rate is about 2.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the resolution, *R*, between the analyte and internal standard peaks is not less than 12; and the relative standard deviation for not less than four replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. The relative retention times are about 1.0 for diflorasone diacetate and 2.4 for the internal standard. Calculate the quantity, in mg, of C<sub>26</sub>H<sub>32</sub>F<sub>2</sub>O<sub>7</sub> in the portion of Diflorasone Diacetate taken by the formula:

$$0.5C(R_U / R_S)$$

in which *C* is the concentration, in µg per mL, of USP Diflorasone Diacetate RS in the *Standard preparation*; and *R<sub>U</sub>* and *R<sub>S</sub>* are the ratios of the peak areas for diflorasone diacetate and the internal standard areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Diflorasone Diacetate Cream

» Diflorasone Diacetate Cream contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>26</sub>H<sub>32</sub>F<sub>2</sub>O<sub>7</sub>.

**Packaging and storage**—Preserve in collapsible tubes, preferably at controlled room temperature.

**USP Reference standards** <11>—

USP Diflorasone Diacetate RS

**Identification**—The chromatogram of the *Assay preparation* exhibits a major peak for diflorasone diacetate at a retention time that corresponds to that exhibited in the chromatogram of the *Standard preparation* obtained in the *Assay*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—It meets the requirements of the tests for absence of *Staphylococcus aureus* and *Pseudomonas aeruginosa*.

**Minimum fill** <755>—meets the requirements.

**Assay—**

**Mobile phase**, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Diflorasone Diacetate*.

**Assay preparation**—Transfer an accurately weighed amount of Cream, equivalent to about 1 mg of diflorasone

diacetate, to a suitable container. Add 30.0 mL of *Internal standard solution*, and shake for about 30 minutes. Centrifuge the solution, and remove and discard the top (excipient) layer. Use the lower, clear chloroform layer.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diflorasone Diacetate*. Calculate the quantity, in mg, of diflorasone diacetate (C<sub>26</sub>H<sub>32</sub>F<sub>2</sub>O<sub>7</sub>) in the portion of Cream taken by the formula:

$$0.03C(R_U / R_S)$$

in which the terms are as defined therein.

## Diflorasone Diacetate Ointment

» Diflorasone Diacetate Ointment contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>26</sub>H<sub>32</sub>F<sub>2</sub>O<sub>7</sub>.

**Packaging and storage**—Preserve in collapsible tubes, preferably at controlled room temperature.

**USP Reference standards** <11>—

USP Diflorasone Diacetate RS

**Identification**—It responds to the *Identification* test under *Diflorasone Diacetate Cream*.

**Microbial enumeration tests** <61> and **Tests for specified microorganisms** <62>—Proceed with Ointment as directed for *Microbial limits* under *Diflorasone Diacetate Cream*.

**Minimum fill** <755>: meets the requirements.

**Assay—**

**Mobile phase**, *Internal standard solution*, *Standard preparation*, and *Chromatographic system*—Proceed as directed in the *Assay* under *Diflorasone Diacetate*.

**Assay preparation**—Using Ointment instead of the Cream, proceed as directed for *Assay preparation* in the *Assay* under *Diflorasone Diacetate Cream*.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Diflorasone Diacetate*. Calculate the quantity, in mg, of diflorasone diacetate (C<sub>26</sub>H<sub>32</sub>F<sub>2</sub>O<sub>7</sub>) in the portion of Ointment taken by the formula:

$$0.03C(R_U / R_S)$$

in which the terms are as defined therein.

## Diflunisal

C<sub>13</sub>H<sub>8</sub>F<sub>2</sub>O<sub>3</sub> 250.20

[1,1'-Biphenyl]-3-carboxylic acid, 2',4'-difluoro-4-hydroxy-, 2',4'-Difluoro-4-hydroxy-3-biphenylcarboxylic acid [22494-42-4].

» Diflunisal contains not less than 98.0 percent and not more than 101.5 percent of C<sub>13</sub>H<sub>8</sub>F<sub>2</sub>O<sub>3</sub>, calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Diflunisal RS

**Identification**—**A:** *Infrared Absorption* (197M).**B:** *Ultraviolet Absorption* (197U)—*Solution:* 40 µg per mL.*Medium:* hydrochloric acid in methanol (1 in 120).

Absorptivities at 315 nm, calculated on the dried basis, do not differ by more than 3.0%.

**Loss on drying** (731)—Dry it in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 4 hours: it loses not more than 0.3% of its weight.**Residue on ignition** (281): not more than 0.1%.**Heavy metals, Method II** (231): 0.001%.

**Chromatographic purity**—Prepare a solution of it in methanol containing about 10 mg per mL. Prepare solutions of USP Diflunisal RS in methanol having concentrations of 10, 0.05, and 0.02 mg per mL, respectively (*Standard solutions A, B, and C*). Apply 5-µL portions of all four solutions to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture and previously washed with methanol. Allow the spots to dry, and develop the chromatogram in a freshly prepared solvent system consisting of a mixture of *n*-hexane, dioxane, and glacial acetic acid (85:10:5) in a paper-lined, equilibrated tank, until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, allow to air-dry, and examine the plate under short-wavelength UV light: the chromatograms show principal spots at about the same  $R_f$  value. Estimate the concentration of any spot observed in the chromatogram of the test solution, other than the principal spot, by comparison with the spots in the chromatograms of *Standard solutions B* and *C*: the intensity of any individual spot is not greater than that of the principal spot obtained from *Standard solution C* (0.2%), and the sum of all additional spots is not greater than that of the principal spot obtained from *Standard solution B* (0.5%).

**Assay**—

**Mobile phase**—Prepare a suitable mixture of water, methanol, acetonitrile, and glacial acetic acid (55:23:10:2) such that the retention time of diflunisal is about 18 minutes. Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Diflunisal RS in a mixture of acetonitrile and water (4:1) to obtain a solution having a known concentration of about 1 mg per mL. Dilute an accurately measured volume of this solution with a mixture of acetonitrile and water (1:1) to obtain a solution having a known concentration of about 0.2 mg per mL.

**Assay preparation**—Transfer about 50 mg of Diflunisal, accurately weighed, to a 50-mL volumetric flask. Dilute with a mixture of acetonitrile and water (4:1) to volume, and mix. Transfer 5.0 mL of this solution to a 25-mL volumetric flask. Dilute with a mixture of acetonitrile and water (1:1) to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm × 30-cm column that contains packing L1 and is maintained at a temperature of 40°. The flow rate is about 1.5 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed under *Procedure*: the column efficiency determined from the analyte peak is not less than 2500 theoretical plates, the tailing factor is not more than 2.0, the capacity factor is not less than 7.2, and the relative standard deviation for replicate injections is not more than 1%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into

the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{13}H_8F_2O_3$  in the portion of Diflunisal taken by the formula:

$$250C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Diflunisal RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses of the major peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

---

**Diflunisal Tablets**

---

» Diflunisal Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{13}H_8F_2O_3$ .

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Diflunisal RS

**Identification**—

**A:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation*, obtained as directed in the *Assay*.

**B:** Transfer a quantity of finely ground Tablets, equivalent to about 100 mg of diflunisal, to a 10-mL volumetric flask, add 2 mL of water, and sonicate for 5 minutes. Dilute with methanol to volume, sonicate for an additional 5 minutes, mix, and filter. Separately apply 10 µL each of the filtrate and a *Standard solution* of USP Diflunisal RS in methanol solution (4 in 5) containing 10 mg per mL to a thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Develop the chromatogram in a solvent system consisting of *n*-hexane, glacial acetic acid, and chloroform (17:3:2) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the chamber, air-dry, and examine under long-wavelength UV light: the  $R_f$  value of the principal spot in the chromatogram of the test solution corresponds to that obtained from the *Standard solution*.

**Dissolution** (711)—

**pH 7.20, 0.1 M Tris buffer**—Dissolve 121 g of tris(hydroxymethyl)aminomethane (THAM) in 9 liters of water. Adjust the solution with a 7 in 100 solution of anhydrous citric acid in water to a pH of 7.45, at 25°. Dilute with water to 10.0 liters, equilibrate to 37°, and adjust to a pH of 7.20, if necessary.

**Medium:** pH 7.20, 0.1 M Tris buffer; 900 mL.

**Apparatus 2:** 50 rpm.

**Time:** 30 minutes.

**Procedure**—Determine the amount of  $C_{13}H_8F_2O_3$  dissolved from UV absorbances at the wavelength of maximum absorbance at about 306 nm of filtered portions of the solution under test, suitably diluted with pH 7.20, 0.1 M Tris buffer, in comparison with a *Standard solution* having a known concentration of USP Diflunisal RS in the same *Medium*.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{13}H_8F_2O_3$  is dissolved in 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Procedure for content uniformity**—Transfer 1 finely powdered Tablet to a 200-mL volumetric flask, add 50 mL of water, shake by mechanical means for 30 minutes, and sonicate for 2 minutes. Add 100 mL of alcohol to the flask,

shake by mechanical means for 15 minutes, and sonicate for 2 minutes. Dilute with alcohol to volume, mix, and centrifuge a portion of the solution. Quantitatively dilute an accurately measured volume of the resultant clear supernatant with alcohol, if necessary, to obtain a test solution containing about 1.25 mg per mL. Transfer about 125 mg of USP Diflunisal RS, accurately weighed, to a 100-mL volumetric flask, add 75 mL of alcohol to dissolve, dilute with water to volume, and mix to obtain the Standard solution. Transfer 3.0 mL each of the Standard solution and the test solution to separate 50-mL volumetric flasks. To each flask add 5.0 mL of a solution containing 1 g of ferric nitrate in 100 mL of 0.08 N nitric acid, dilute with water to volume, and mix. Concomitantly determine the absorbances of the solutions at the wavelength of maximum absorbance at about 550 nm, with a suitable spectrophotometer, using water as the blank. Calculate the quantity, in mg, of  $C_{13}H_8F_2O_3$  in the Tablet by the formula:

$$(TC / D)(A_U / A_S)$$

in which  $T$  is the labeled quantity, in mg, of diflunisal in the Tablet;  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Diflunisal RS in the Standard solution;  $D$  is the concentration, in  $\mu\text{g}$  per mL, of diflunisal in the test solution, based upon the labeled quantity per Tablet and the extent of dilution; and  $A_U$  and  $A_S$  are the absorbances of the solutions from the test solution and the Standard solution, respectively.

#### Assay—

**Mobile phase**—Prepare a suitable degassed mixture of water, methanol, acetonitrile, and glacial acetic acid (45:40:17:6) such that the retention time of diflunisal is about 8 minutes.

**Standard preparation**—Dissolve a suitable quantity of USP Diflunisal RS in a mixture of acetonitrile and water (60:40) to obtain a solution having a known concentration of about 1.0 mg per mL.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 100 mg of diflunisal, to a 100-mL volumetric flask containing about 5 mL of water. Sonicate for 5 minutes, add 60.0 mL of acetonitrile, sonicate for an additional 5 minutes, dilute with water to volume, mix, and filter.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 254-nm detector and a 3.9-mm  $\times$  30-cm column that contains packing L1. The flow rate is about 2.0 mL per minute. Chromatograph the *Standard preparation*, and record the peak responses as directed for *Procedure*: the tailing factor for the analyte peak is not more than 2.0, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 20  $\mu\text{L}$ ) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of diflunisal ( $C_{13}H_8F_2O_3$ ) in the portion of Tablets taken by the formula:

$$100C(r_U / r_S)$$

in which  $C$  is the concentration, in mg per mL, of USP Diflunisal RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Digitalis

» Digitalis is the dried leaf of *Digitalis purpurea* Linné (Fam. Scrophulariaceae). The potency of Digitalis is such that, when assayed as directed, 100 mg is equivalent to not less than 1 USP Digitalis Unit.\*

NOTE—When Digitalis is prescribed, Powdered Digitalis is to be dispensed.

**Packaging, storage, and labeling**—Preserve in containers that protect it from absorbing moisture. Digitalis labeled to indicate that it is to be used only in the manufacture of glycosides is exempt from the moisture and storage requirements.

#### USP Reference standards <11>—

USP Digitalis RS

#### Botanic characteristics—

**Unground Digitalis**—This occurs as more or less crumpled or broken leaves. The leaf blades are ovate, oblong-ovate to ovate-lanceolate, mostly 10 to 35 cm in length and 4 cm to 11 cm in width and contracted into a winged petiole. The apex is obtuse; the margin irregularly crenate or serrate; the lower surface densely pubescent, the upper surface wrinkled and finely hairy. The venation is conspicuously reticulate, the mid-rib and principal veins broad and flat, and the lower veins are continued into the wings of the petiole. The color of the upper surface is dark green, of the lower surface grayish from the dense pubescence, the larger veins often purplish. The odor is slight when dry, peculiar and characteristic when moistened.

**Histology**—Digitalis shows an upper epidermis whose cells possess slightly wavy anticlinal walls, numerous hairs, and no stomata; a lower epidermis with wavy anticlinal walls, numerous oval stomata, and many hairs, and frequently not attached over irregular areas to the cell layer within, especially near the veins; a broad chlorenchyma of a single layer of short palisade cells and several layers of spongy parenchyma; and numerous vascular bundles in the larger veins and petioles, separated by vascular rays one cell in width. On the apex of each marginal tooth one or two water stomata occur.

**Ground Digitalis**—This is dark green in color. Present are chiefly numerous irregular fragments of epidermis and chlorenchyma; nonglandular hairs that are frequently curved or crooked, up to 500  $\mu\text{m}$  in length, uniseriate, two- to eight-celled, some of the cells collapsed so that the planes of adjoining cells may be at right angles, the terminal cell pointed or rounded; few, small glandular hairs, usually with a one- or two-celled stalk, and a one- or two-celled head; fragments of veins and petioles with annular, reticulate, spiral and simple pitted vessels and tracheids. Calcium oxalate is absent.

**Acid-insoluble ash** (561): not more than 5.0%.

**Foreign organic matter** (561)—The proportion of stems, browned leaves, flowers, and other foreign organic matter does not exceed 2.0%.

**Water**, Method III, *Procedure for Articles of Botanical Origin* <921>: not more than 6.0%.

#### Assay—

**Standard preparation**—Weigh the contents of 1 container of USP Digitalis RS to the nearest mg, either in the original container or in a weighing bottle, and transfer to a dry, hard-glass, glass-stoppered container or centrifuge tube of at least 50-mL capacity. Complete the weighing within 5 minutes after opening the ampul. Add a menstruum consisting of 4 volumes of alcohol and 1 volume of water so

\* One USP Digitalis Unit represents the potency of 100 mg of USP Digitalis RS.

that the total volume of menstruum added corresponds to 10 mL for each g of powder. Insert the stopper, the upper third of which is greased lightly with petrolatum. Shake the mixture for  $24 \pm 2$  hours at  $25 \pm 5^\circ$  by mechanical means, which continuously brings the solid material into fresh contact with the liquid phase. Immediately thereafter transfer, if necessary, to a centrifuge tube, centrifuge, and decant the supernatant tincture into a dry, hard-glass bottle having a tight closure. Preserve under refrigeration, and use within 30 days.

**Assay preparation**—Transfer about 5 g of Digitalis, reduced to a fine powder and accurately weighed, to a hard-glass, glass-stoppered container or centrifuge tube of at least 50-mL capacity. Proceed as directed under *Standard preparation*, beginning with "Add a menstruum." Preserve under refrigeration, and use within 30 days.

**Pigeons**—Employ adult pigeons free from gross evidence of disease or emaciation, and of such weight that the heaviest weighs less than twice the weight of the lightest. Divide the pigeons into groups as nearly alike as practicable with respect to breed and weight so that the average weight of the group assigned by random choice to the *Standard preparation* shall not differ by more than 30% from the average weight of the group assigned to the preparation to be assayed. Withhold food but not water during the period 16 to 28 hours prior to use. Preparatory to injection, lightly anesthetize the pigeon with ether, and immobilize it; expose an alar vein, and cannulate with a suitable cannula. Maintain the anesthesia during cannulation and throughout the subsequent injection period at such a level that pain is absent, the pupillary and corneal reflexes are present, and the voluntary musculature is not relaxed beyond permitting the pigeon to make some voluntary movement occasionally.

**Preparation of test dilutions**—On the day of the assay, dilute portions of the *Standard preparation* and of the preparation to be assayed (*Assay preparation*) with isotonic sodium chloride solution in such a way that the estimated fatal dose of each dilution will be 15 mL per kg of body weight.

**Injection of test dilutions**—Arrange to inject the appropriate test dilution by suitable means such as a small-bore buret calibrated to 0.05 mL. Start the injection after ensuring the absence of air bubbles from the injection apparatus, by infusing, within a few seconds, a volume of the test dilution equivalent to 1 mL per kg of body weight. Repeat this dose at 5-minute intervals thereafter until the pigeon dies of cardiac arrest.

Use a total of not less than 6 pigeons for the *Standard preparation* and not less than 6 pigeons for the preparation to be assayed. If the average number of doses for any given dilution required to produce death is less than 13 or greater than 19, or if the larger exceeds the smaller in the same assay by more than 4 doses, regard these data as preliminary. Use them as a guide, and repeat with a fresh, higher or lower dilution. Complete the assay within the period of 30 days for preservation of the *Standard preparation* and *Assay preparation*.

**Calculation of potency**—Tabulate and average the number of doses of the *Standard preparation*, designating the average  $\bar{z}_s$ , and likewise obtain the corresponding average,  $\bar{z}_u$ , for the *Assay preparation*. Compute the potency in USP Digitalis Units per mL (i.e., per 100 mg) of the *Assay preparation* as:

$$\text{Potency} = \bar{z}_s R / \bar{z}_u$$

where  $R$  equals  $v_s / v_u$ , in which  $v_s$  is the number of USP Digitalis Units per mL of *Standard preparation* dilution, and  $v_u$  is the volume, in mL, of *Assay preparation* per mL of dilution. Compute the confidence interval,  $L$  (see Equation (31) under *Confidence Intervals for Individual Assays in Design and Analysis of Biological Assays* (111)). If  $L$  exceeds 0.30, repeat the assay or inject more pigeons with one or both preparations until the confidence interval is 0.30 or less.

The potency of Digitalis, calculated from that of the *Assay preparation*, is satisfactory if the result is not less than 0.85 USP Digitalis Unit per 100 mg.

## Powdered Digitalis

» Powdered Digitalis is Digitalis dried at a temperature not exceeding  $60^\circ$ , reduced to a fine or a very fine powder, and adjusted, if necessary, to conform to the official potency by admixture with sufficient Lactose, Starch, or exhausted marc of digitalis, or with Powdered Digitalis having either a lower or a higher potency.

The potency of Powdered Digitalis is such that, when assayed as directed, 100 mg is equivalent to 1 USP Digitalis Unit.\*

NOTE—When Digitalis is prescribed, Powdered Digitalis is to be dispensed.

**Packaging and storage**—Preserve in tight, light-resistant containers. A package of a suitable desiccant may be enclosed in the container.

### USP Reference standards (11)—

USP Digitalis RS  
USP Digitoxin RS  
USP Gitoxin RS  
 $C_{41}H_{64}O_{14}$  780.96

### Identification—

**A:** It conforms to the description for *Ground Digitalis* in the section *Botanic characteristics* under *Digitalis*.

**B:** Transfer 100 mg to a 15-mL centrifuge tube containing 2.0 mL of diluted alcohol and 1.0 mL of lead acetate TS, mix, shake, and boil for 2 minutes. Centrifuge, decant the supernatant into a second 15-mL centrifuge tube, add 2.0 mL of chloroform, and mix. Centrifuge, then remove the lower layer, and filter it through a chloroform-washed small column of anhydrous sodium sulfate (100 to 300 mg) into a 5-mL centrifuge tube. Evaporate the chloroform solution under a stream of nitrogen to dryness, and dissolve the residue in 100  $\mu$ L of a mixture of methanol and chloroform (1:1). Prepare a Standard solution in the same manner, using 100 mg of USP Digitalis RS (*Standard solution A*). Prepare a second Standard solution by dissolving USP Digitoxin RS and USP Gitoxin RS in a mixture of methanol and chloroform (1:1) such that the final concentration of each is approximately 0.2 mg per mL (*Standard solution B*). Apply 10  $\mu$ L of the test solution, 10  $\mu$ L of *Standard solution A*, and 10  $\mu$ L of *Standard solution B*, each as a narrow band about 15 mm long, to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture, and allow the bands to dry. Develop the chromatogram in a saturated chamber, using a solvent system consisting of a mixture of ethyl acetate, methanol, and water (30:4:3) until the solvent front has moved about 15 cm from the origin. Mix 10 mL of chloramine T solution (3 in 100) with 40 mL of a 1 in 4 solution of trichloroacetic acid in alcohol (store the mixture in a cool place, and use it within 1 week), and spray the air-dried chromatographic plate with this mixture. Heat the plate at  $110^\circ$  for 15 to 20 minutes, and examine it under long-wavelength UV light. Locate the 2 prominent bands obtained from *Standard solution A* corresponding in  $R_f$  value to the 2 bands obtained from *Standard solution B*. The chromatogram obtained from the solution under test shows bands corresponding to them, and also shows bands corresponding to the 3 other bands most prominent in the chromato-

\* One USP Digitalis Unit represents the potency of 100 mg of USP Digitalis RS.

gram from *Standard solution A* but of lower  $R_F$  value. Relative  $R_F$  values for the 5 bands are: 1.0 (digitoxin); 0.8 to 0.9 (gitoxin); 0.6 to 0.7; 0.4 to 0.5; and 0.3 to 0.4.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the test for absence of *Salmonella* species.

**Water**, *Method III, Procedure for Articles of Botanical Origin* (921): not more than 5.0%.

**Acid-insoluble ash** (561): not more than 5.0%.

**Assay**—Proceed with Powdered Digitalis as directed in the *Assay under Digitalis*.

The potency of Powdered Digitalis, calculated from that of the *Assay preparation*, is satisfactory if the result is not less than 0.85 USP Digitalis Unit and not more than 1.20 USP Digitalis Units per 100 mg.

## Digitalis Capsules

» Digitalis Capsules contain an amount of Powdered Digitalis equivalent to not less than 85.0 percent and not more than 120.0 percent of the labeled potency.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Digitalis RS

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the test for absence of *Salmonella* species.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Standard preparation*—Prepare as directed in the *Assay under Digitalis*.

*Assay preparation*—Empty the contents of not less than 20 Capsules into a hard-glass, glass-stoppered container of not less than 50-mL capacity. Add a menstruum consisting of 4 volumes of alcohol and 1 volume of water so that the total volume of menstruum corresponds to 1 mL for each expected USP Digitalis Unit. Insert the stopper, the upper third of which is greased lightly with petrolatum. Shake the mixture at  $25 \pm 5^\circ$  for  $24 \pm 2$  hours by mechanical means, which continuously brings the solid material into fresh contact with the liquid phase. Immediately thereafter transfer to a centrifuge tube, centrifuge, and decant the supernatant tincture into a dry, hard-glass bottle having a tight closure. Preserve under refrigeration, and use within 30 days.

*Pigeons, Preparation of test dilutions, Injection of test dilutions, and Calculation of potency*—Proceed as directed in the *Assay under Digitalis*.

## Digitalis Tablets

» Digitalis Tablets contain an amount of Powdered Digitalis equivalent to not less than 85.0 percent and not more than 120.0 percent of the labeled potency.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Digitalis RS

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—It meets the requirements of the test for absence of *Salmonella* species.

**Disintegration** (701): 30 minutes.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Standard preparation*—Prepare as directed in the *Assay under Digitalis*.

*Assay preparation*—Weigh and finely powder not fewer than 25 Tablets. Weigh accurately a portion of the powder, equivalent to not less than 20 Tablets. Transfer to a dry, hard-glass, glass-stoppered container of not less than 50-mL capacity. Proceed as directed for the *Assay preparation* in the *Assay under Digitalis Capsules*, beginning with "Add a menstruum."

*Pigeons, Preparation of test dilutions, Injection of test dilutions, and Calculation of potency*—Proceed as directed in the *Assay under Digitalis*.

## Digitoxin

$C_{41}H_{64}O_{13}$  764.94

Card-20(22)-enolide, 3-[(O-2,6-dideoxy- $\beta$ -D-ribohexopyranosyl-(1 $\rightarrow$ 4)-O-2,6-dideoxy- $\beta$ -D-ribohexopyranosyl-(1 $\rightarrow$ 4)-2,6-dideoxy- $\beta$ -D-ribohexopyranosyl)oxy]-14-hydroxy, (3 $\beta$ ,5 $\beta$ )-.

Digitoxin [71-63-6].

» Digitoxin is a cardiotonic glycoside obtained from *Digitalis purpurea* Linné, *Digitalis lanata* Ehrhart (Fam. Scrophulariaceae), and other suitable species of *Digitalis*. Digitoxin contains not less than 92.0 percent and not more than 103.0 percent of  $C_{41}H_{64}O_{13}$ , calculated on the dried basis.

**Caution**—Handle Digitoxin with exceptional care since it is highly potent.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Digitoxin RS

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** Prepare a test solution in methanol containing 1 mg per mL. Apply 1  $\mu$ L of the test solution and 1  $\mu$ L of a Standard solution of USP Digitoxin RS in methanol containing 1 mg per mL to a suitable thin-layer chromatographic plate (see *Chromatography* (621)) coated with a 0.25-mm layer of chromatographic silica gel mixture. Allow the applications to dry, and develop the chromatogram in a solvent system consisting of a mixture of methylene chloride and methanol (93:7) until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and dry the plate at  $100^\circ$  to remove the solvent. Spray the plate with a 6 in 10 solution of sulfuric acid in methanol, heat at  $105^\circ$  for 10 minutes, and examine the chromatogram under long-wavelength UV light: the  $R_F$  value of the principal spot ob-

tained from the test solution corresponds to that obtained from the Standard solution.

**C:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Loss on drying** (731)—Dry it in vacuum at 105° for 1 hour: it loses not more than 1.5% of its weight.

**Residue on ignition** (281): negligible, from 100 mg.

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water and acetonitrile (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Digitoxin RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 40 µg per mL.

**Assay preparation**—Transfer about 50 mg of Digitoxin, accurately weighed, to a 200-mL volumetric flask. Dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 4 mL of this solution into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

**System suitability preparation**—Prepare a solution in *Mobile phase* containing about 40 µg each of digitoxin and digoxin per mL.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 218-nm detector and a 3.9-mm × 30-cm column that contains packing L1. The flow rate is about 1 mL per minute. Chromatograph the *Standard preparation* and the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.35 for digoxin and 1.0 for digitoxin; the resolution, *R*, between the digoxin and digitoxin peaks is not less than 2.0; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections of the *Standard preparation* is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 50 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub> in the portion of Digitoxin taken by the formula:

$$1.25C(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Digitoxin RS in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Digitoxin Injection

» Digitoxin Injection is a sterile solution of Digitoxin in 5 to 50 percent (v/v) of alcohol, and may contain Glycerin or other suitable solubilizing agents. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub>.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** (11)—

USP Digitoxin RS

USP Endotoxin RS

#### Identification—

**A:** To a portion of Injection, equivalent to about 1 mg of digitoxin, add 10 mL of water, and extract with 10 mL of chloroform. Evaporate the chloroform extract on a steam bath with the aid of a current of air to dryness. Dissolve the residue in 2 mL of a solution prepared by mixing 0.3 mL of ferric chloride TS and 50 mL of glacial acetic acid, and underlay with 2 mL of sulfuric acid: at the zone of contact of the two liquids a brown color, which gradually changes to light green, then to blue, is produced, and finally the entire acetic acid layer acquires a blue color.

**B:** To a portion of Injection, equivalent to about 0.2 mg of digitoxin, add 10 mL of water, and extract with 10 mL of chloroform. Evaporate the chloroform extract on a steam bath with the aid of a current of air to dryness. Add 2 mL of a freshly prepared 1 in 100 solution of *m*-dinitrobenzene in alcohol, and allow to stand for 10 minutes with frequent shaking. Add 2 mL of a 1 in 200 solution of tetramethylammonium hydroxide in alcohol, and mix: a red-violet color develops slowly and then fades.

**C:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Bacterial endotoxins** (85)—It contains not more than 111.0 USP Endotoxin Units per mg of digitoxin.

**Alcohol content** (611): between 90.0% and 110.0% of the labeled percentage of C<sub>2</sub>H<sub>5</sub>OH.

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system**—Prepare as directed in the *Assay* under *Digitoxin*.

**Assay preparation**—Transfer an accurately measured volume of Injection, equivalent to about 1 mg of digitoxin, to a 25-mL volumetric flask. Dilute with *Mobile phase* to volume, and mix.

**Procedure**—Proceed as directed for *Procedure* in the *Assay* under *Digitoxin*. Calculate the quantity, in µg, of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub> in each mL of the Injection taken by the formula:

$$25(C / V)(r_U / r_S)$$

in which *C* is the concentration, in µg per mL, of USP Digitoxin RS in the *Standard preparation*, *V* is the volume, in mL, of Injection taken, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Digitoxin Tablets

» Digitoxin Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub>.

**NOTE**—Avoid the use of strongly adsorbing substances, such as bentonite, in the manufacture of Digitoxin Tablets.

**Packaging and storage**—Preserve in well-closed containers.

**USP Reference standards** (11)—

USP Digitoxin RS

#### Identification—

**A:** Transfer a quantity of finely powdered Tablets, equivalent to not less than 1 mg of digitoxin, to a suitable flask, add 20 mL of chloroform, and sonicate. Filter, and evapo-

rate the filtrate on a steam bath with the aid of a current of air to dryness. Dissolve the residue in 2 mL of a solution prepared by mixing 0.3 mL of ferric chloride TS and 50 mL of glacial acetic acid, and underlay with 2 mL of sulfuric acid: at the zone of contact of the two liquids a brown color, which gradually changes to light green, then to blue, is produced, and finally the entire acetic acid layer acquires a blue color.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the major peak in the chromatogram of the *Standard preparation* as obtained in the *Assay*.

**Dissolution** (711)—[NOTE—Throughout this procedure, use scrupulously clean glassware, which previously has been rinsed successively with hydrochloric acid, water, and alcohol, and carefully dried. Take precautions to prevent contamination from fluorescent particles and from metal and rubber surfaces.]

*Medium:* dilute hydrochloric acid (3 in 500); 500 mL. [NOTE—Use the same batch of *Medium* throughout the test.]

*Apparatus 1:* 120 ± 5 rpm.

*Times:* 30 minutes; 60 minutes.

*Standard stock solution*—Weigh accurately about 30 mg of USP Digitoxin RS, dissolve in a minimum amount of alcohol in a 500-mL volumetric flask, add dilute alcohol (4 in 5) to volume, and mix.

*Standard solutions*—Just prior to use, dilute 5.0 mL of the *Standard stock solution* with *Medium* to 500.0 mL, and mix. Transfer aliquots (2.0 to 10.0 mL) of this solution to individual separators to prepare standards equivalent to 20, 40, 60, 80, and 100% of the labeled amount of digitoxin in 500 mL. Add *Medium* to make 10 mL, and proceed as directed for *Procedure*, beginning with "Extract with three 15-mL portions of chloroform."

*Procedure*—Proceed as directed for *Procedure* under *Disso-*  
*lution* (711). After 30 minutes, accurately timed, withdraw a suitable aliquot of the solution under test from a point midway between the stirring shaft and the wall of the vessel, and approximately midway in depth. Filter the solution promptly after withdrawal, using a suitable membrane filter of not greater than 0.8-μm porosity, discarding the first 10 mL of the filtrate. Without replacing the *Medium* withdrawn, continue to rotate the basket, and after an additional 30 minutes, accurately timed, similarly withdraw and filter another aliquot. Treat each of these solutions as follows: Assuming dissolution of 100% of the labeled amount of digitoxin, transfer aliquots, equivalent to 6 μg of digitoxin, to suitable separators. Extract with three 15-mL portions of chloroform, and combine the chloroform extracts in glass-stoppered flasks. Evaporate the combined extracts on a steam bath, with the aid of a current of air, to dryness. In a similar manner, prepare a blank using a suitable volume of *Medium*.

*Measurement of fluorescence*—Begin with the *Standard solutions*, and keep all flasks in the same sequence throughout, so that the elapsed time from addition of reagents to reading of fluorescence is the same for each set. Treat 1 flask at a time as follows: Add 10 mL of a solution freshly prepared by dissolving 35 mg of ascorbic acid in 25 mL of methanol and cautiously adding the solution to 100 mL of hydrochloric acid. Mix, and add 1 mL of a solution freshly prepared by diluting 1 mL of 30 percent hydrogen peroxide with water to 500 mL and diluting 1 volume of the resulting solution with 20 volumes of water. Mix, and insert the stopper in the flask. After 45 minutes, measure the fluorescence at about 575 nm, the excitation wavelength being about 395 nm. Correct each reading for the blank, and plot a standard curve of fluorescence versus percentage dissolution. By calculation from the standard curve, determine the percentage dissolution of digitoxin in each Tablet within 30 minutes and the total percentage dissolution of digitoxin within 60 minutes, taking into account the volume of the solution under test removed after the first 30 minutes of the test.

**Tolerances**—Not less than 60% of the labeled amount of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub> is dissolved within 30 minutes for each Tablet tested, and not less than 85% of the labeled amount is dissolved within 60 minutes for the average of the Tablets tested.

**Uniformity of dosage units** (905): meet the requirements.

*Procedure for content uniformity*—Place 1 Tablet in a suitable glass-stoppered conical flask. Add an accurately measured volume of *Mobile phase* (prepared as directed in the *Assay* under *Digitoxin*) sufficient to obtain a solution containing about 10 μg of digitoxin per mL, and shake by mechanical means until the Tablet has completely disintegrated (not less than 30 minutes). Centrifuge, and use the clear supernatant as the test solution. Dissolve an accurately weighed quantity of USP Digitoxin RS in *Mobile phase*, and dilute quantitatively, and stepwise if necessary, with *Mobile phase* to obtain a Standard solution having a known concentration of about 10 μg per mL. Proceed as directed in the *Assay*. Calculate the quantity, in mg, of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub> in the Tablet by the formula:

$$(LC / D)(r_U / r_S)$$

in which *L* is the labeled quantity, in mg, of digitoxin in the Tablet, *C* is the concentration, in μg per mL, of USP Digitoxin RS in the Standard solution, *D* is the concentration, in μg per mL, of digitoxin in the test solution based on the labeled quantity in the Tablet and the extent of dilution, and *r<sub>U</sub>* and *r<sub>S</sub>* are the digitoxin peak responses obtained from the test solution and the Standard solution, respectively.

#### Assay—

*Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Digitoxin*.

*Assay preparation*—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed quantity of powder, equivalent to about 1 mg of digitoxin, to a 25-mL volumetric flask. Add 15 mL of *Mobile phase*, and sonicate. Dilute with *Mobile phase* to volume, and mix. Filter a portion of this solution, discarding the first few mL of the filtrate. The filtrate is the *Assay preparation*.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Digitoxin*. Calculate the quantity, in μg, of C<sub>41</sub>H<sub>64</sub>O<sub>13</sub> in the portion of Tablets taken by the formula:

$$25C(r_U / r_S)$$

in which *C* is the concentration, in μg per mL, of USP Digitoxin RS in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Digoxin

C<sub>41</sub>H<sub>64</sub>O<sub>14</sub> 780.94

Card-20(22)-enolide, 3-[(O-2,6-dideoxy-β-D-ribohexopyranosyl-(1→4)-O-2,6-dideoxy-β-D-ribohexopyranosyl-(1→4)-2,6-dideoxy-β-D-ribohexopyranosyl)oxy]-12,14-dihydroxy-, (3β,5β,12β)-.

Digoxin.

$3\beta$ -[(O-2,6-Dideoxy- $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4)-O-2,6-dideoxy- $\beta$ -D-ribo-hexopyranosyl-(1 $\rightarrow$ 4))-2,6-dideoxy- $\beta$ -D-ribo-hexopyranosyl]oxy]-12 $\beta$ ,14-dihydroxy-5 $\beta$ -card-20(22)-enolide [20830-75-5].

» Digoxin is a cardiotonic glycoside obtained from the leaves of *Digitalis lanata* Ehrhart (Fam. Scrophulariaceae). It contains not less than 95.0 percent and not more than 101.0 percent of  $C_{41}H_{64}O_{14}$ , calculated on the dried basis.

**Caution**—Handle Digoxin with exceptional care, since it is extremely poisonous.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Digoxin RS

USP Gitoxin RS

$C_{41}H_{64}O_{14}$  780.96

**Identification**—

**A:** *Infrared Absorption* (197K).

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* as obtained in the *Assay*.

**C:** Examine in visible light the thin-layer chromatograph prepared as directed in the test for *Related glycosides*: the  $R_f$  value of the principal blue spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

**Loss on drying** (731)—Dry it in vacuum at 105° for 1 hour: it loses not more than 1.0% of its weight.

**Residue on ignition** (281): not more than 0.5%, a 100-mg specimen being used.

**Related glycosides**—

*Chloramine T-trichloroacetic acid reagent*—Mix 10 mL of a freshly prepared solution of chloramine T (3 in 100) and 40 mL of a 1 in 4 solution of trichloroacetic acid in dehydrated alcohol.

*Spotting solvent*—Prepare a mixture of chloroform and methanol (2:1).

*Standard solution*—Dissolve an accurately weighed quantity of USP Digoxin RS in *Spotting solvent* to obtain a solution containing 10 mg per mL.

*Gitoxin standard solution*—Dissolve an accurately weighed quantity of USP Gitoxin RS in *Spotting solvent* to obtain a solution containing 0.30 mg per mL.

*Test solution*—Transfer 250.0 mg of Digoxin to a 25-mL volumetric flask, dissolve in and dilute with *Spotting solvent* to volume, and mix.

*Procedure*—Apply 10  $\mu$ L of the *Test solution*, 10  $\mu$ L of the *Standard solution*, and 10  $\mu$ L of the *Gitoxin standard solution* on a line parallel to and about 2.5 cm from the bottom edge of a reversed-phase thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel mixture to which is permanently bonded octadecylsilane (C18). Allow the spots to dry, and place the plates in a developing chamber containing a mixture of methanol and water (7:3). Develop the chromatogram until the solvent front has moved about 15 cm above the line of application. Remove the plate, and allow the solvent to evaporate. Spray the plate with *Chloramine T-trichloroacetic acid reagent*, freshly mixed, and heat in an oven at 110° for 10 minutes. Examine the plate under long-wavelength UV light: no spot from the *Test solution* except that due to digoxin is more intense than the spot from the *Gitoxin standard solution* (not more than 3% of any related glycoside as gitoxin).

**Residual solvents** (467): The limits for methylene chloride and chloroform are 2000  $\mu$ g per g.

**Assay**—

*Mobile phase*—Prepare a suitable degassed and filtered mixture of water and acetonitrile (37:13), making adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Digoxin RS in diluted alcohol, and dilute quantitatively and stepwise with diluted alcohol to obtain a solution having a known concentration of about 250  $\mu$ g per mL. Use a sonic bath to aid dissolution.

*Assay preparation*—Transfer about 50 mg of Digoxin, accurately weighed, to a 200-mL volumetric flask. Dissolve in about 150 mL of diluted alcohol by sonication, dilute with diluted alcohol to volume, and mix.

*System suitability preparation*—Prepare a solution in diluted alcohol of USP Digoxin RS and digoxigenin having concentrations of about 40  $\mu$ g of each per mL.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 218-nm detector and a 4.2-mm  $\times$  25-cm column that contains packing L1 and a 3.2-mm  $\times$  15-mm guard column that contains packing L1. The flow rate is about 3.0 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between digoxin and digoxigenin is not less than 4.0; the column efficiency determined from the digoxin peak is not less than 1200 theoretical plates; the tailing factor for the digoxin peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{41}H_{64}O_{14}$  in the portion of Digoxin taken by the formula:

$$0.2C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Digoxin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses for the digoxin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Digoxin Injection

» Digoxin Injection is a sterile solution of Digoxin in Water for Injection and Alcohol or other suitable solvents. It contains not less than 90.0 percent and not more than 105.0 percent of the labeled amount of  $C_{41}H_{64}O_{14}$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass. Avoid exposure to excessive heat.

**USP Reference standards** (11)—

USP Digoxin RS

USP Endotoxin RS

**Identification**—

**A:** Injection meets the requirements for *Identification test A* under *Digoxin Oral Solution*.

**B:** *Chloramine T-trichloroacetic acid reagent*, *Spotting solvent*, and *Standard solution*—Proceed as directed for *Identification test B* under *Digoxin Oral Solution*.

*Test solution*—Pipet a volume of Injection, equivalent to 0.5 mg of digoxin, into a separator, and add 5 mL of water. Extract with three 10-mL portions of chloroform, combining the extracts in a conical flask. Evaporate the combined chloroform extracts on a steam bath with the aid of a current of

air to dryness. (If traces of water or propylene glycol remain, dry the flask in vacuum at 100° for 30 minutes.) Dissolve the residue in 2 mL of *Spotting solvent*.

**Procedure**—Proceed as directed for *Procedure* in the test for *Related glycosides* under *Digoxin*, except to omit the use of the *Gitoxin standard solution*. Examine the plate under long-wavelength UV light: the  $R_f$  value of the principal spot in the chromatogram of the *Test solution* corresponds to that of the *Standard solution*.

**Bacterial endotoxins** (85)—It contains not more than 200.0 USP Endotoxin Units per mg of digoxin.

**Alcohol content** (611): between 9.0% and 11.0% of  $C_2H_5OH$ .

**Other requirements**—It meets the requirements under *Injections* (1).

#### Assay—

**Mobile phase**—Proceed as directed in the *Assay* under *Digoxin*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Digoxin RS in diluted alcohol, and dilute quantitatively with diluted alcohol to obtain a solution having a known concentration of about 250 µg per mL. Use a sonic bath to aid dissolution. If necessary, dilute quantitatively to match, approximately, the concentration of the *Injection*.

**Chromatographic system and System suitability preparation**—Proceed as directed in the *Assay* under *Digoxin*.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and *Injection* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of  $C_{41}H_{64}O_{14}$  in each mL of the *Injection* taken by the formula:

$$C(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Digoxin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses for the digoxin peaks obtained from the *Injection* and the *Standard preparation*, respectively.

## Digoxin Oral Solution

» Digoxin Oral Solution contains, in each 100 mL, not less than 4.50 mg and not more than 5.25 mg of digoxin ( $C_{41}H_{64}O_{14}$ ).

**Packaging and storage**—Preserve in tight containers, and avoid exposure to excessive heat.

**USP Reference standards** (11)—

USP Digoxin RS

#### Identification—

**A:** The retention time of the major peak in the chromatogram of Oral Solution corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**B:** *Chloramine T-trichloroacetic acid reagent*—Mix 10 mL of a freshly prepared solution of chloramine T (3 in 100) and 40 mL of a 1 in 4 solution of trichloroacetic acid in dehydrated alcohol.

**Spotting solvent**—Prepare a mixture of chloroform and methanol (2:1).

**Standard solution**—Dissolve an accurately weighed quantity of USP Digoxin RS in *Spotting solvent* to obtain a solution containing 0.25 mg per mL.

**Test solution**—Pipet a volume of Oral Solution, equivalent to 0.5 mg of digoxin, into a separator. Add sufficient water to obtain a final volume of approximately 50 mL. Extract the

aqueous layer with three 30-mL portions of chloroform, combining the extracts in a conical flask. Evaporate the combined chloroform extracts on a steam bath with the aid of a current of air to dryness. Add 2 mL of *Spotting solvent* to the residue, and shake for 2 minutes.

**Procedure**—Proceed as directed for *Procedure* in the test for *Related glycosides* under *Digoxin*, except to omit the use of the *Gitoxin standard solution*. Examine the plate under long-wavelength UV light: the  $R_f$  value of the principal spot in the chromatogram of the *Test solution* corresponds to that in the chromatogram of the *Standard solution*.

**Alcohol content** (611): between 90.0% and 115.0% of the labeled amount of  $C_2H_5OH$ .

#### Assay—

**Mobile phase**—Prepare a filtered and degassed mixture of water, acetonitrile, and isopropyl alcohol (70:27.5:2.5). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Standard preparation**—Dissolve an accurately weighed quantity of USP Digoxin RS in diluted alcohol, and dilute quantitatively and stepwise with diluted alcohol to obtain a solution having a known concentration of about 20 µg per mL.

**Assay preparation**—Transfer an accurately measured volume of 10.0 mL of Oral Solution, equivalent to about 500 µg of digoxin, to a 25-mL volumetric flask, dilute with diluted alcohol to volume, and mix.

**System suitability preparation**—Prepare as directed in the *Assay* under *Digoxin*.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 218-nm detector and a 4.6-mm × 15-cm column that contains packing L1. The flow rate is about 0.5 mL per minute. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the resolution,  $R$ , between digoxin and digoxigenin bisdigitoxoside is not less than 2.0; the tailing factor for the analyte peak is not more than 2.0; and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 10 µL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in µg, of digoxin ( $C_{41}H_{64}O_{14}$ ) in each mL of the Oral Solution taken by the formula:

$$2.5C(r_U / r_S)$$

in which  $C$  is the concentration, in µg per mL, of USP Digoxin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the digoxin peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Digoxin Tablets

» Digoxin Tablets contain not less than 90.0 percent and not more than 105.0 percent of the labeled amount of  $C_{41}H_{64}O_{14}$ .

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** (11)—

USP Digoxin RS

#### Identification—

**A:** *Chloramine T-trichloroacetic acid reagent*—Prepare as directed for *Identification* test B under *Digoxin Oral Solution*.

**Spotting solvent**—Use dehydrated alcohol.

**Test solution**—Transfer an accurately weighed portion of finely powdered Tablets, equivalent to 0.5 mg of digoxin, to

a 10-mL centrifuge tube. Add 2 mL of *Spotting solvent*, sonicate for 10 to 15 minutes, and centrifuge. Decant and use the supernatant.

**Standard solution**—Dissolve an accurately weighed quantity of USP Digoxin RS in *Spotting solvent* to obtain a solution having a known concentration of about 0.25 mg per mL.

**Procedure**—Proceed as directed for *Procedure* in the test for *Related glycosides* under *Digoxin*, except to omit the use of the *Gitoxin standard solution*. Examine the plate under long-wavelength UV light: the  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Dissolution** <711>—[NOTE—Throughout this procedure, use scrupulously clean glassware, which previously has been rinsed successively with hydrochloric acid, water, and alcohol, and carefully dried. Take precautions to prevent contamination from fluorescent particles and from metal and rubber surfaces.]

**Medium:** 0.1 N hydrochloric acid; 500 mL. [NOTE—Use the same batch of *Dissolution Medium* throughout the test.]

**Apparatus 1:** 120 rpm.

**Time:** 60 minutes.

**Ascorbic acid-methanol solution**—Prepare a solution containing 2 mg of ascorbic acid per mL of methanol.

**Hydrogen peroxide-methanol solution**—On the day of use, dilute 2.0 mL of recently assayed 30 percent hydrogen peroxide with methanol to 100 mL. Store in a refrigerator. Just prior to use, dilute 2.0 mL of this solution with methanol to 100 mL.

**Standard solutions**—Transfer about 25 mg of USP Digoxin RS, accurately weighed, to a 500-mL volumetric flask. Dissolve in a minimum amount of alcohol, add dilute alcohol (4 in 5) to volume, and mix. Dilute 10.0 mL of this solution with dilute alcohol (4 in 5) to 100.0 mL, and mix. Just prior to use, dilute suitable aliquots of the resulting solution with *Dissolution Medium* to 50.0 mL to prepare *Standard solutions* equivalent to 20%, 40%, 60%, 80%, and 100%, respectively, of the labeled amount of digoxin in 500 mL.

**Test solution**—Promptly after withdrawal, pass a portion of the solution under test through a filter having a 0.8- $\mu$ m or finer porosity, discarding the first 10 mL of the filtrate. This is the *Test solution*.

**Procedure**—Transfer to individual glass-stoppered flasks duplicate 1.0-mL portions of the *Test solution*, 1.0-mL portions of each of the *Standard solutions*, and 1.0 mL of the *Medium* to provide a blank. Begin with the *Standard solutions*, and keep all flasks in the same sequence throughout, so that the elapsed time from addition of reagents to reading of fluorescence is the same for each flask in the set. Treating one flask at a time, add the following three reagents, in the order named, in as rapid a sequence as possible, swirling after each addition: 1.0 mL of *Ascorbic acid-methanol solution*, 5.0 mL of hydrochloric acid, and 1.0 mL of *Hydrogen peroxide-methanol solution*. Insert the stoppers in the flasks, and after 2 hours, measure the fluorescence at about 485 nm, the excitation wavelength being about 372 nm. To check the stability of the fluorometer, repeat the measurement of fluorescence on one or more treated *Standard solutions*. Correct each reading for the blank, and plot a standard curve of fluorescence versus percentage dissolution. Determine the percentage dissolution of digoxin in the *Test solution* by reading from the standard graph.

**Tolerances**—Not less than 80% (Q) of the labeled amount of  $C_{41}H_{64}O_{14}$  is dissolved in 60 minutes. The requirement is met if the quantities dissolved from the Tablets tested con-

form to the accompanying acceptance table instead of the table shown under *Dissolution* <711>.

Acceptance Table

Stage	Number Tested	Acceptance Criteria
S <sub>1</sub>	6	Each unit is not less than Q + 5%.
S <sub>2</sub>	6	Average of 12 units (S <sub>1</sub> + S <sub>2</sub> ) is equal to or greater than Q, and no unit is less than Q – 5%.

**Uniformity of dosage units** <905>: meet the requirements.

**Assay**—

**Mobile phase, Chromatographic system, and System suitability preparation**—Proceed as directed in the *Assay* under *Digoxin*.

**Standard preparation**—Dissolve an accurately weighed quantity of USP Digoxin RS in diluted alcohol, and dilute quantitatively and stepwise with diluted alcohol to obtain a solution having a known concentration of about 40  $\mu$ g per mL. Use a sonic bath to aid dissolution.

**Assay preparation**—Weigh and finely powder not fewer than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 1 mg of digoxin, to a glass-stoppered, 50-mL conical flask. Add 25.0 mL of diluted alcohol with swirling, sonicate for about 30 minutes, and cool. Filter a portion of this solution through a 0.8- $\mu$ m porosity membrane filter, discarding the first 10 mL of the filtrate.

**Procedure**—Separately inject equal volumes (about 50  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{41}H_{64}O_{14}$  in the portion of Tablets taken by the formula:

$$25C(r_U / r_S)$$

in which C is the concentration, in mg per mL, of USP Digoxin RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the responses for the digoxin peaks obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydrocodeine Bitartrate

$C_{18}H_{23}NO_3 \cdot C_4H_6O_6$  451.47  
Morphinan-6-ol, 4,5-epoxy-3-methoxy-17-methyl-, (5 $\alpha$ ,6 $\alpha$ )-2,3-dihydroxybutanedioate (1:1) (salt).  
4,5 $\alpha$ -Epoxy-3-methoxy-17-methylmorphinan-6 $\alpha$ -ol (+)-tartrate (salt).

» Dihydrocodeine Bitartrate contains not less than 98.0 percent and not more than 102.0 percent of  $C_{18}H_{23}NO_3 \cdot C_4H_6O_6$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**USP Reference standards** <11>—

USP Dihydrocodeine Bitartrate RS

**Identification—**

**A:** The chromatogram of the *Assay preparation* obtained as directed in the *Assay* exhibits a major peak for dihydrocodeine, the retention time of which corresponds to that in the chromatogram of the *Standard preparation* similarly determined.

**B:** It responds to the tests for *Tartrate* (191).

**C:** To a solution of 20 mg in 5 mL of sulfuric acid in a test tube add 1 drop of ferric chloride TS, and heat in a boiling water bath for 2 minutes: although the solution may darken, no blue color is produced (*distinction from codeine and morphine*).

**Melting range**, *Class I* (741): between 186° and 190°, but the range between beginning and end of melting does not exceed 2.5°.

**Specific rotation** (781S): between −72° and −75°.

*Test solution:* 10 mg per mL, in water.

**pH** (791): between 3.2 and 4.2, in a solution (1 in 10).

**Loss on drying** (731)—Dry it at 105° for 4 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** (281): not more than 0.1%.

**Ammonium salts**—To about 100 mg of it in a suitable test tube add 5 mL of 1 N sodium hydroxide, and heat on a steam bath: the odor of ammonia is not detected.

**Ordinary impurities** (466)—

*Test solution:* water.

*Standard solution:* water.

*Eluent:* a mixture of methylene chloride, methanol, and ammonium hydroxide (90:10:1).

*Visualization:* 17, and view under short-wavelength UV light.

**Assay—**

**Mobile phase**—Prepare a mixture of acetonitrile, water, and diethylamine (800:4:1). Prepare a suitable mixture of this solution and methanol (55:45). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

**Resolution solution**—Prepare a solution in methanol containing about 0.4 mg of USP Dihydrocodeine Bitartrate RS and 0.6 mg of hydrocodone bitartrate per mL. Prepare a mixture of this solution and water (1:1).

**Standard preparation**—Transfer about 20 mg of USP Dihydrocodeine Bitartrate RS, accurately weighed, to a 50-mL volumetric flask, add 25 mL of methanol, swirl to dissolve, dilute with water to volume, and mix.

**Assay preparation**—Transfer about 20 mg of Dihydrocodeine Bitartrate, accurately weighed, to a 50-mL volumetric flask, add 25 mL of methanol, swirl to dissolve, dilute with water to volume, and mix.

**Chromatographic system** (see *Chromatography* (621))—The liquid chromatograph is equipped with a 280-nm detector and a 4.6-mm × 25-cm column that contains 5-μm packing L3. The flow rate is about 1.5 mL per minute. Chromatograph the *Resolution solution*, and record the responses as directed under *Procedure*: the relative retention times are about 0.8 for hydrocodone and 1.0 for dihydrocodeine, and the resolution, *R*, between the hydrocodone and dihydrocodeine peaks is not less than 1.8. Chromatograph the *Standard preparation*, and record the responses as directed under *Procedure*: the column efficiency determined from the dihydrocodeine peak is not less than 900 theoretical plates, the tailing factor for the dihydrocodeine peak is not more than 1.7, and the relative standard deviation for replicate injections is not more than 2.0%.

**Procedure**—Separately inject equal volumes (about 25 μL) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quan-

tity, in mg, of  $C_{18}H_{23}NO_3 \cdot C_4H_6O_6$  in the portion of Dihydrocodeine Bitartrate taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dihydrocodeine Bitartrate RS in the *Standard preparation*, and *r<sub>U</sub>* and *r<sub>S</sub>* are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

**Dihydroergotamine Mesylate**

$C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$  679.78  
Ergotaman-3',6',18-trione, 9,10-dihydro-12'-hydroxy-2'-methyl-5'-(phenylmethyl)-, (5'α)-, monomethanesulfonate (salt).  
Dihydroergotamine monomethanesulfonate [6190-39-2].

» Dihydroergotamine Mesylate contains not less than 97.0 percent and not more than 103.0 percent of  $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ , calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—  
USP Dihydroergotamine Mesylate RS

**Identification—**

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 50 μg per mL.

*Medium:* 70% alcohol.

Absorptivities at 280 nm, calculated on the dried basis, do not differ by more than 3.0%.

**C:** The principal spot from the *Test preparation* found in the test for *Related alkaloids* corresponds in *R<sub>f</sub>* value to that obtained from the *Standard preparation*.

**Specific rotation** (781S): between −16.7° and −22.7°.

*Test solution:* 25 mg per mL, in a mixture of chloroform, alcohol, and ammonium hydroxide (10:10:1).

**pH** (791): between 4.4 and 5.4, in a solution (1 in 1000).

**Loss on drying** (731)—Dry it in vacuum at 100° to constant weight: it loses not more than 4.0% of its weight.

**Related alkaloids—**

**Solvent mixture**—Mix 10 volumes of chloroform, 10 volumes of methanol, and 1 volume of ammonium hydroxide.

**Test solution**—Prepare a solution of Dihydroergotamine Mesylate in *Solvent mixture* to contain 20 mg per mL.

**Standard solution and Standard dilutions**—Prepare a solution of USP Dihydroergotamine Mesylate RS in *Solvent mixture* to contain 20 mg per mL (*Standard solution*). Prepare a series of dilutions of the *Standard solution* in *Solvent mixture* to contain 0.40 mg, 0.20 mg, and 0.10 mg per mL (*Standard dilutions*).

**Procedure**—In a suitable chromatographic chamber arranged for thin-layer chromatography place a volume of a solvent system consisting of a mixture of chloroform and alcohol (9:1) sufficient to develop the chromatogram, cover, and allow to equilibrate for 30 minutes. Apply 5-μL portions

of the *Test solution*, the *Standard solution*, and each of the three *Standard dilutions* to a suitable thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Allow the spots to dry, and develop the chromatogram until the solvent front has moved about three-fourths of the length of the plate. Remove the plate from the developing chamber, mark the solvent front, and allow the solvent to evaporate. Locate the spots on the plate by lightly spraying with a solution prepared by dissolving 800 mg of *p*-dimethylaminobenzaldehyde in a cooled mixture of 80 g of alcohol and 20 g of sulfuric acid. The  $R_f$  value of the principal spot obtained from the *Test solution* corresponds to that obtained from the *Standard solution*. Estimate the concentration of any other spots observed in the lane for the *Test solution* by comparison with the *Standard dilutions*. The spots from the 0.40-, 0.20-, and 0.10-mg-per-mL dilutions are equivalent to 2.0%, 1.0%, and 0.50% of impurities, respectively. The sum of the impurities is not greater than 2.0%.

#### Assay—

*Diluent 1*—Prepare a solution of 0.1 mL of phosphoric acid in 1000 mL of water.

*Diluent 2*—Prepare a mixture of *Diluent 1* and acetonitrile (60:40).

*Solution A*—Prepare a filtered and degassed mixture of water, 25 percent ammonia water, and 98% formic acid (1000:10:5). Adjust the pH to 8.50.

*Solution B*—Prepare a filtered and degassed mixture of acetonitrile and *Solution A* (80:20).

*Mobile phase*—Use variable mixtures of *Solution A* and *Solution B* as directed for *Chromatographic system*. Make adjustments to either solution as necessary (see *System Suitability* under *Chromatography* <621>).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dihydroergotamine Mesylate RS in acetonitrile, and dilute quantitatively, and stepwise if necessary, with *Diluent 1* to obtain a solution having a known concentration of about 0.6 mg per mL. [NOTE—The final ratio of acetonitrile and *Diluent 1* should be similar to the final ratio obtained in the *Assay preparation*.]

*Assay preparation*—Transfer about 30 mg of Dihydroergotamine Mesylate, accurately weighed, to a 50-mL volumetric flask, dissolve in 20 mL of acetonitrile, dilute with *Diluent 1* to volume, and mix.

*Chromatographic system* (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector and 4.0-mm  $\times$  25-cm column that contains packing L1. The flow rate is about 1.5 mL per minute. The chromatograph is programmed as follows.

Time (minutes)	Solution A (%)	Solution B (%)	Elution
0	60	40	equilibration
0–12	60→50	40→50	linear gradient
12–20	50→15	50→85	linear gradient
20–24	15	85	isocratic
24–25	15→60	85→40	linear gradient
25–31	60	40	re-equilibration

Chromatograph the *Standard preparation*, and record the peak areas as directed for *Procedure*: the tailing factor is between 0.8 and 1.5; and the relative standard deviation for replicate injections is not more than 2.0%.

*Procedure*—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the areas for the analyte peaks. Calculate the quantity,

in mg, of  $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$  in the portion of Dihydroergotamine Mesylate taken by the formula:

$$50C(r_U / r_S)$$

in which *C* is the concentration, in mg per mL, of USP Dihydroergotamine Mesylate RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak areas obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydroergotamine Mesylate Injection

» Dihydroergotamine Mesylate Injection is a sterile solution of Dihydroergotamine Mesylate in Water for Injection. It contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$ .

**Packaging and storage**—Preserve in single-dose containers, preferably of Type I glass, protected from light.

**USP Reference standards** <11>—  
USP Dihydroergotamine Mesylate RS  
USP Endotoxin RS

**Identification**—Dilute 2 mL of Injection with water to 25 mL: the UV absorption spectrum of the solution so obtained exhibits maxima and minima at the same wavelengths as that of a similar solution of USP Dihydroergotamine Mesylate RS, concomitantly measured.

**Bacterial endotoxins** <85>—It contains not more than 175.0 USP Endotoxin Units per mg of dihydroergotamine mesylate.

**pH** <791>: between 3.4 and 4.9.

**Other requirements**—It meets the requirements under *Injections* <1>.

#### Assay—

*Reagent preparation*—Dissolve 250 mg of *p*-dimethylaminobenzaldehyde in a cooled mixture of 130 mL of sulfuric acid and 70 mL of water, and add 0.40 mL of ferric chloride solution (1 in 20).

*Standard preparation*—Dissolve in tartaric acid solution (1 in 100) a suitable quantity of USP Dihydroergotamine Mesylate RS, accurately weighed, and dilute quantitatively and stepwise with the same solvent to obtain a solution having a known concentration of about 50  $\mu$ g per mL.

*Assay preparation*—Transfer an accurately measured volume of Injection, equivalent to about 5 mg of dihydroergotamine mesylate, to a 100-mL volumetric flask, dilute with tartaric acid solution (1 in 100) to volume, and mix.

*Procedure*—Transfer 5.0 mL each of the *Standard preparation*, the *Assay preparation*, and tartaric acid solution (1 in 100) to provide the blank, to separate 50-mL conical flasks. Add 10.0 mL of the *Reagent preparation* to each, shake, and allow to stand for 30 minutes. Concomitantly determine the absorbances of the solutions in 1-cm cells at the wavelength of maximum absorbance at about 585 nm, with a suitable spectrophotometer, using the blank to set the instrument. Calculate the quantity, in mg, of  $C_{33}H_{37}N_5O_5 \cdot CH_4O_3S$  in each mL of the Injection taken by the formula:

$$(0.1 C / V)(A_U / A_S)$$

in which *C* is the concentration, in  $\mu$ g per mL, of USP Dihydroergotamine Mesylate RS in the *Standard preparation*, *V* is the volume, in mL, of Injection taken, and  $A_U$  and  $A_S$  are the absorbances of the solutions from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydrostreptomycin Sulfate

(C<sub>21</sub>H<sub>41</sub>N<sub>7</sub>O<sub>12</sub>)<sub>2</sub> · 3H<sub>2</sub>SO<sub>4</sub> 1461.42  
Dihydrostreptomycin sulfate (2:3) (salt) [5490-27-7].

» Dihydrostreptomycin Sulfate has a potency equivalent to not less than 650 µg of dihydrostreptomycin (C<sub>21</sub>H<sub>41</sub>N<sub>7</sub>O<sub>12</sub>) per mg, except that if it is labeled as being crystalline, it has a potency equivalent to not less than 725 µg of dihydrostreptomycin per mg, or if it is labeled as being solely for oral use, it has a potency equivalent to not less than 450 µg of dihydrostreptomycin per mg.

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label it to indicate that it is intended for veterinary use only. If it is crystalline, it may be so labeled. If it is intended solely for oral use, it is so labeled. Where it is intended for use in preparing injectable dosage forms, the label states that it is sterile or must be subjected to further processing during the preparation of injectable dosage forms.

**USP Reference standards** (11)—  
USP Dihydrostreptomycin Sulfate RS  
USP Endotoxin RS  
USP Streptomycin Sulfate RS

### Identification—

**A:** To a solution of 4 mg in 2 mL of water, add 0.5 mL of 1 N hydrochloric acid, and heat in a water bath for 20 minutes. Remove the tube from the bath, and add 1.0 mL of a 1 in 200 solution of 1-naphthol in 1 N sodium hydroxide. Heat again for 10 minutes, cool briefly in an ice bath, and add water to make 25 mL: a red color develops, intensifying during about 10 minutes.

**B:** A solution (1 in 50) responds to the tests for *Sulfate* (191).

**Crystallinity** (695) (where labeled as being crystalline): meets the requirements.

**pH** (791): between 4.5 and 7.0, in a solution containing 200 mg of dihydrostreptomycin per mL, except that if it is labeled as being solely for oral use, the pH is between 3.0 and 7.0.

**Loss on drying** (731)—Dry about 100 mg in a capillary-stoppered bottle in vacuum at 60° for 3 hours: it loses not more than 5.0% of its weight, except that if it is labeled as being solely for oral use, it loses not more than 14.0% of its weight.

### Streptomycin—

**Ferric chloride stock solution**—Dissolve 5 g of ferric chloride in 50 mL of 0.1 N hydrochloric acid.

**Ferric chloride solution**—Dilute 2.5 mL of *Ferric chloride stock solution* with sufficient 0.01 N hydrochloric acid to make 100 mL. Use this solution within 1 day.

**Standard solutions**—Dissolve an accurately weighed quantity of USP Streptomycin Sulfate RS in water to obtain a

stock solution containing 1.0 mg of streptomycin (C<sub>21</sub>H<sub>39</sub>N<sub>7</sub>O<sub>12</sub>) per mL. Transfer 1.0, 2.0, 3.0, 4.0, and 5.0 mL, respectively, of this stock solution to each of five 25-mL volumetric flasks. Transfer 9.0, 8.0, 7.0, 6.0, and 5.0 mL of water to the flasks, respectively.

**Test solution**—Transfer about 800 mg of Dihydrostreptomycin Sulfate, accurately weighed, to a 25-mL volumetric flask, dissolve in and dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a second 25-mL volumetric flask.

**Procedure**—To each of the flasks containing the *Standard solutions* and the *Test solution*, and to a seventh 25-mL volumetric flask containing 10.0 mL of water to provide a blank, add 2.0 mL of 1 N sodium hydroxide, and heat in a water bath for 10 minutes. Cool the flasks in ice water for 3 minutes, and to each add 2.0 mL of 1.2 N hydrochloric acid and 5.0 mL of *Ferric chloride solution*. Dilute with water to volume, and mix. Concomitantly determine the absorbances of the solutions from the *Standard solutions* and the *Test solution* at the wavelength of maximum absorbance at about 550 nm, with a suitable spectrophotometer, using the blank to set the instrument at zero. Plot the absorbance values of the solutions from the *Standard solutions* versus concentration, in µg per mL, of streptomycin, and draw the straight line best fitting the five plotted points. From the graph so obtained, determine the concentration, C, in µg per mL, of streptomycin in the solution from the *Test solution*. Calculate the percentage of streptomycin in the portion of Dihydrostreptomycin Sulfate taken by the formula:

$$6250C / WP$$

in which *W* is the weight, in mg, of Dihydrostreptomycin Sulfate taken, and *P* is the potency, in µg of dihydrostreptomycin per mg, of the Dihydrostreptomycin Sulfate taken as determined in the *Assay*: not more than 3.0% is found, except that if it is labeled as being crystalline, not more than 1.0% is found, or if it is labeled as being solely for oral use, not more than 5.0% is found.

**Other requirements**—Where the label states that Dihydrostreptomycin Sulfate is sterile, it meets the requirements for *Sterility* and *Bacterial endotoxins* under *Dihydrostreptomycin Injection*. Where the label states that Dihydrostreptomycin Sulfate must be subjected to further processing during the preparation of injectable dosage forms, it meets the requirements for *Bacterial endotoxins* under *Dihydrostreptomycin Injection*.

**Assay**—Proceed with Dihydrostreptomycin Sulfate as directed for the turbidimetric assay of dihydrostreptomycin under *Antibiotics—Microbial Assays* (81).

## Dihydrostreptomycin Sulfate Boluses

» Dihydrostreptomycin Sulfate Boluses contain the equivalent of not less than 85.0 percent and not more than 120.0 percent of the labeled amount of dihydrostreptomycin (C<sub>21</sub>H<sub>41</sub>N<sub>7</sub>O<sub>12</sub>).

**Packaging and storage**—Preserve in tight containers.

**Labeling**—Label Boluses to indicate that they are intended for veterinary use only.

**USP Reference standards** (11)—  
USP Dihydrostreptomycin Sulfate RS

**Loss on drying** (731)—Dry about 100 mg, accurately weighed, of finely ground Boluses in a capillary-stoppered bottle in vacuum at a pressure not exceeding 5 mm of mercury at 60° for 3 hours: it loses not more than 10.0% of its weight.

**Assay**—Proceed as directed for the cylinder-plate assay of dihydrostreptomycin under *Antibiotics—Microbial Assays* (81), using 3 Boluses added to a mixture of 499.0 mL of *Buffer No. 3* and 1.0 mL of polysorbate 80 and blended for 5 minutes in a high-speed glass blender jar. Allow to stand for not less than 1 hour, and repeat the blending. While stirring this mixture, withdraw an accurately measured volume of it, and dilute quantitatively and stepwise with *Buffer No. 3* to obtain a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Dihydrostreptomycin Injection

» Dihydrostreptomycin Injection contains an amount of Dihydrostreptomycin Sulfate equivalent to not less than 90.0 percent and not more than 120.0 percent of the labeled amount of dihydrostreptomycin ( $C_{21}H_{41}N_7O_{12}$ ). It contains one or more suitable preservatives.

**Packaging and storage**—Preserve in single-dose or multiple-dose containers.

**Labeling**—Label it to indicate that it is intended for veterinary use only.

**USP Reference standards** (11)—  
USP Dihydrostreptomycin Sulfate RS  
USP Endotoxin RS

**Identification**—It responds to the *Identification* tests under *Dihydrostreptomycin Sulfate*.

**Bacterial endotoxins** (85)—It contains not more than 0.5 USP Endotoxin Unit per mg of dihydrostreptomycin.

**Sterility** (71)—It meets the requirements when tested as directed for *Membrane Filtration* under *Test for Sterility of the Product to be Examined*.

**pH** (791): between 5.0 and 8.0.

### Assay—

*Assay preparation 1* (where it is represented as being in a single-dose container)—Withdraw all of the withdrawable contents of Injection, using a suitable hypodermic needle and syringe, and dilute quantitatively with water to obtain a solution containing a convenient quantity of dihydrostreptomycin in each mL.

*Assay preparation 2* (where the label states the quantity of dihydrostreptomycin in a given volume of solution)—Dilute an accurately measured volume of Injection quantitatively with water to obtain a solution containing a convenient quantity of dihydrostreptomycin in each mL.

*Procedure*—Proceed as directed for the turbidimetric assay of dihydrostreptomycin under *Antibiotics—Microbial Assays* (81), using an accurately measured volume of *Assay preparation* diluted quantitatively with water to yield a *Test Dilution* having a concentration assumed to be equal to the median dose level of the Standard.

## Dihydrotachysterol

$C_{28}H_{46}O$  398.66

9,10-Secoergosta-5,7,22-trien-3-ol, (3 $\beta$ ,5E,7E,10 $\alpha$ ,22E)-.  
Dihydrotachysterol.  
9,10-Secoergosta-5,7,22-trien-3 $\beta$ -ol [67-96-9].

» Dihydrotachysterol contains not less than 97.0 percent and not more than 103.0 percent of  $C_{28}H_{46}O$ .

**Packaging and storage**—Preserve in light-resistant, hermetic glass containers from which air has been displaced by an inert gas.

**USP Reference standards** (11)—  
USP Dihydrotachysterol RS

### Identification—

**A:** *Infrared Absorption* (197K).

**B:** *Ultraviolet Absorption* (197U)—

*Solution:* 8  $\mu$ g per mL.

*Medium:* alcohol.

**Specific rotation** (781S): between +100° and +103°.

*Test solution:* 20 mg per mL, in alcohol.

**Residue on ignition** (281): not more than 0.1%.

### Assay—

*Mobile phase*—Prepare a degassed and filtered solution of isooctane and isopropyl alcohol (100:1). Make adjustments if necessary (see *System Suitability* under *Chromatography* (621)).

*Standard preparation*—Dissolve an accurately weighed quantity of USP Dihydrotachysterol RS in *Mobile phase*, and dilute quantitatively and stepwise, if necessary, with *Mobile phase* to obtain a solution having a known concentration of about 10  $\mu$ g per mL.

*Assay preparation*—Transfer about 50 mg of Dihydrotachysterol, accurately weighed, to a 500-mL volumetric flask, dissolve in and dilute with *Mobile phase* to volume, and mix. Pipet 10 mL of the resulting solution into a 100-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*System suitability preparation*—Prepare a solution of ergocalciferol in *Mobile phase* having a concentration of about 0.7 mg per mL. Reflux under nitrogen for 20 minutes, and cool to ambient temperature (*Solution A*). Pipet 3 mL of *Solution A* and 2 mL of a solution in *Mobile phase* containing 0.1 mg of dihydrotachysterol per mL into a 25-mL volumetric flask, dilute with *Mobile phase* to volume, and mix.

*Chromatographic system* (see *Chromatography* (621))—The liquid chromatograph is equipped with a 254-nm detector and a 4.6-mm  $\times$  25-cm column that contains packing L3. The flow rate is about 1 mL per minute. Chromatograph replicate injections of the *Standard preparation*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 2.5%. Chromatograph the *System suitability preparation*, and record the peak responses as directed for *Procedure*: the relative retention times are about 0.6 for pre-ergocalciferol, 0.7 for dihydrotachysterol, and 1.0 for ergocalciferol; and the resolution,  $R$ , between the pre-ergocalciferol and dihydrotachysterol peaks is not less than 1.5.

*Procedure*—Separately inject equal volumes (about 20  $\mu$ L) of the *Standard preparation* and the *Assay preparation* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of  $C_{28}H_{46}O$  in the portion of Dihydrotachysterol taken by the formula:

$$5C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu$ g per mL, of USP Dihydrotachysterol RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses for dihydrotachysterol obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydrotachysterol Capsules

» Dihydrotachysterol Capsules contain a solution of Dihydrotachysterol in a suitable vegetable oil. Capsules contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{28}H_{46}O$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Dihydrotachysterol RS

**Identification**—

**A:** Cut open 1 Capsule, and remove the contents: the Capsule contents respond to *Identification test A* under *Dihydrotachysterol Oral Solution*.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that of the *Standard preparation* obtained as directed in the *Assay*.

**Uniformity of dosage units** (905): meet the requirements.

**Assay**—

*Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dihydrotachysterol*.

*Assay preparation*—Combine the contents of not less than 20 Capsules. Transfer an accurately weighed quantity of Capsule contents, equivalent to about 500  $\mu\text{g}$  of dihydrotachysterol, to a 50-mL volumetric flask, dissolve in 25 mL of *Mobile phase*, and mix. Dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Dihydrotachysterol*. Calculate the quantity, in  $\mu\text{g}$ , of  $C_{28}H_{46}O$  in the portion of Capsules taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Dihydrotachysterol RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydrotachysterol Oral Solution

» Dihydrotachysterol Oral Solution contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of dihydrotachysterol ( $C_{28}H_{46}O$ ).

**Packaging and storage**—Preserve in tight, light-resistant glass containers.

**USP Reference standards** (11)—

USP Dihydrotachysterol RS

**Identification**—

**A:** Place 1 drop of Oral Solution on a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Spray the plate with 3.5% phosphomolybdic acid solution (prepared by dissolving 3.5 g of phosphomolybdic acid in 100 mL of isopropyl alcohol), and immediately heat the plate over a hot plate: a dark blue spot appears on a yellow background.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**Uniformity of dosage units** (905)—

FOR ORAL SOLUTION PACKAGED IN SINGLE-UNIT CONTAINERS: meets the requirements.

**Deliverable volume** (698)—

FOR ORAL SOLUTION PACKAGED IN MULTIPLE-UNIT CONTAINERS: meets the requirements.

**Assay**—

*Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dihydrotachysterol*.

*Assay preparation* [FOR ORAL SOLUTION IN AN OIL MEDIUM]—Transfer an accurately measured volume of Oral Solution, equivalent to about 500  $\mu\text{g}$  of dihydrotachysterol, by means of a “to contain” pipet to a 50-mL volumetric flask. Rinse the pipet with *Mobile phase*, add the rinsing to the flask, dilute with *Mobile phase* to volume, and mix.

*Assay preparation* [FOR ORAL SOLUTION IN AN AQUEOUS MEDIUM]—Transfer an accurately measured volume of Oral Solution, equivalent to about 600  $\mu\text{g}$  of dihydrotachysterol, to a separator containing about 30 mL of water. Add about 1 g of sodium chloride, mix, and extract with three 15-mL portions of chloroform, filtering each portion through absorbent cotton into a suitable glass-stoppered conical flask. Wash the cotton with about 5 mL of chloroform, collecting the washing in the glass-stoppered conical flask. Evaporate the chloroform extracts, and wash with the aid of a current of air to dryness. Dissolve the residue in 50.0 mL of *Mobile phase*, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Dihydrotachysterol*. Calculate the quantity, in  $\mu\text{g}$ , of dihydrotachysterol ( $C_{28}H_{46}O$ ) in the volume of Oral Solution taken by the formula:

$$50C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Dihydrotachysterol RS in the *Standard preparation*; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydrotachysterol Tablets

» Dihydrotachysterol Tablets contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_{28}H_{46}O$ .

**Packaging and storage**—Preserve in well-closed, light-resistant containers.

**USP Reference standards** (11)—

USP Dihydrotachysterol RS

**Identification**—

**A:** Transfer a portion of powdered Tablets, equivalent to about 2 mg of dihydrotachysterol, to a glass-stoppered flask, add about 25 mL of methylene chloride, shake for 15 minutes, and filter. Evaporate the filtrate to dryness, and dissolve the residue in 0.4 mL of methylene chloride. Apply 10  $\mu\text{L}$  of this solution and 10  $\mu\text{L}$  of a Standard solution of USP Dihydrotachysterol RS in methylene chloride containing 5 mg per mL at separate points on a thin-layer chromatographic plate coated with a 0.25-mm layer of chromatographic silica gel. Develop the chromatogram using a solvent system consisting of a mixture of ether and cyclohexane (1:1) until the solvent front has moved about three-fourths of the length of the plate. Air-dry, spray lightly with a 1 in 5 solution of *p*-toluenesulfonic acid in a mixture of alcohol and propylene glycol (9:1), and heat at 80° until reddish brown spots appear (about 10 minutes): the  $R_f$  value

of the principal spot obtained from the solution under test corresponds to that obtained from the Standard solution.

**B:** The retention time of the major peak in the chromatogram of the *Assay preparation* corresponds to that in the chromatogram of the *Standard preparation*, obtained as directed in the *Assay*.

**Disintegration** (701): 10 minutes.

**Uniformity of dosage units** (905): meet the requirements.

#### Assay—

*Mobile phase, Standard preparation, System suitability preparation, and Chromatographic system*—Prepare as directed in the *Assay* under *Dihydrotachysterol*.

*Assay preparation*—Weigh and finely powder not less than 20 Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 2.5 mg of dihydrotachysterol, to a suitable container, add 100.0 mL of dehydrated alcohol, shake by mechanical means for 10 minutes, sonicate, and centrifuge. Transfer 20.0 mL of the supernatant to a 50-mL volumetric flask, and evaporate with the aid of a stream of nitrogen to dryness, observing precautions to avoid exposure to moisture and light. Dissolve the residue in *Mobile phase*, dilute with *Mobile phase* to volume, and mix.

*Procedure*—Proceed as directed for *Procedure* in the *Assay* under *Dihydrotachysterol*. Calculate the quantity, in  $\mu\text{g}$ , of  $\text{C}_{28}\text{H}_{46}\text{O}$  in the portion of Tablets taken by the formula:

$$250C(r_U / r_S)$$

in which  $C$  is the concentration, in  $\mu\text{g}$  per mL, of USP Dihydrotachysterol RS in the *Standard preparation*, and  $r_U$  and  $r_S$  are the peak responses obtained from the *Assay preparation* and the *Standard preparation*, respectively.

## Dihydroxyacetone

$\text{C}_3\text{H}_6\text{O}_3$  90.08  
1,3-Dihydroxy-2-propanone. [96-26-4].

» Dihydroxyacetone contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_3\text{H}_6\text{O}_3$ , calculated on the anhydrous basis.

**Packaging and storage**—Preserve in tight containers in a cool place.

**USP Reference standards** (11)—

USP Dihydroxyacetone RS

#### Identification—

**A:** *Infrared Absorption* (197K).

**B:** The  $R_f$  value of the principal spot in the chromatogram of the *Test solution* corresponds to that of the *Standard preparation* as obtained in the *Chromatographic purity* test.

**pH** (791): between 4.0 and 6.0, in a solution (1 in 20).

**Water, Method I** (921): not more than 0.2%.

**Residue on ignition** (281): not more than 0.1%.

**Heavy metals, Method I** (231): 0.001%.

**Limit of iron** (241): not more than 0.002%.

#### Chromatographic purity—

*Adsorbent:* 0.25-mm layer of chromatographic silica gel mixture.

*Glycerin solution*—Dilute an accurately measured volume of glycerin with methanol to obtain a solution having a concentration of about 0.25 mg per mL.

*Test solution*—Dissolve an accurately weighed quantity of Dihydroxyacetone in methanol to obtain a solution containing about 50 mg per mL.

*Standard solution*—Dissolve an accurately weighed quantity of USP Dihydroxyacetone RS in methanol, and mix to obtain a solution having a known concentration of about 50 mg per mL.

*Application volume:* 1  $\mu\text{L}$ .

*Developing solvent system:* a mixture of acetone and water (19:1).

*Procedure*—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* (621). Spray the plate with a mixture of toluene, a saturated solution of lead tetraacetate in glacial acetic acid, and a 1% solution of dichlorofluorescein in alcohol (190:5:1), and dry the plate for 5 minutes at 105°. Examine the plate under short-wavelength UV light, and compare the intensities of the glycerin spot observed in the chromatogram of the *Test solution* with that of the principal spot in the chromatogram of the *Glycerin solution*: the glycerin spot from the chromatogram of the *Test solution* is not larger or more intense than the principal spot obtained from the *Glycerin solution* (0.5%), and no other secondary spots are observed in the chromatogram of the *Test solution*.

**Limit of protein**—Dissolve 25 g of Dihydroxyacetone in 100 mL of water. Transfer 100  $\mu\text{L}$  of this solution to a 5-mL volumetric flask, dilute with brilliant blue G TS to volume, and mix. Determine the absorbance of this solution at about 595 nm with a suitable spectrophotometer, using 100  $\mu\text{L}$  of water and 5 mL of brilliant blue G TS as the blank: the absorbance of the test solution is not more than 0.400.

**Assay**—Dissolve an accurately weighed quantity of about 0.1 g of Dihydroxyacetone in 20 mL of water, add 20 mL of 0.1 M periodic acid, and allow to stand at room temperature in the dark for 20 minutes. Add about 3 g of sodium bicarbonate, 20 mL of 0.6 M potassium iodide, and 3 mL of starch TS, and titrate with 0.05 M sodium arsenite VS. Perform a blank titration, and make any necessary correction. Each mL of 0.05 M sodium arsenite is equivalent to 4.504 mg of  $\text{C}_3\text{H}_6\text{O}_3$ .

## Dihydroxyaluminum Aminoacetate

$\text{C}_2\text{H}_6\text{AlNO}_4 \cdot x\text{H}_2\text{O}$

Aluminum, (glycinato-*N,O*)dihydroxy-, hydrate.

(Glycinato)dihydroxyaluminum hydrate [41354-48-7].

Anhydrous 135.05 [13682-92-3].

» Dihydroxyaluminum Aminoacetate yields not less than 94.0 percent and not more than 102.0 percent of dihydroxyaluminum aminoacetate ( $\text{C}_2\text{H}_6\text{AlNO}_4$ ), calculated on the dried basis. It may contain small amounts of aluminum oxide and of Aminoacetic Acid.

**Packaging and storage**—Preserve in well-closed containers.

**Identification**—Suspend 1 g in 25 mL of water, add hydrochloric acid, dropwise, until a clear solution is formed, and divide it into two equal parts for the following tests.

**A:** One portion of the solution responds to the tests for *Aluminum* (191).

**B:** To the other portion of the solution add 1 drop of liquefied phenol and 5 mL of sodium hypochlorite TS: a blue color is produced.

**pH** (791): between 6.5 and 7.5, in a suspension of 1 g of it, finely powdered, in 25 mL of water.

**Loss on drying** (731)—Dry it at 130° to constant weight: it loses not more than 14.5% of its weight.

**Mercury, Method IIa** (261)—Transfer 2.0 g to a 100-mL beaker, and add 35 mL of 1 N sulfuric acid: the limit is 1 ppm.

**Isopropyl alcohol**—Transfer about 5 g to a flask provided with a reflux condenser, and add 100 mL of potassium permanganate solution (1 in 300) and 10 mL of sulfuric acid. Reflux the mixture for 30 minutes, distill, and collect 10 mL of the distillate. To 1 mL of the distillate add 5 drops of sodium nitroferricyanide TS and 2 mL of 1 N sodium hydroxide, then add a slight excess of 6 N acetic acid: no red color is produced.

**Nitrogen**—Determine the nitrogen content as directed under *Nitrogen Determination, Method II* (461), using about 100 mg, previously dried and accurately weighed. Each mL of 0.1 N sulfuric acid is equivalent to 1.401 mg of nitrogen. Not less than 9.90% and not more than 10.60% of nitrogen is found.

#### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—Transfer about 2.5 g of Dihydroxyaluminum Aminoacetate, accurately weighed, to a 150-mL beaker, add 15 mL of hydrochloric acid, and warm, if necessary, to dissolve the specimen completely. Transfer the solution with the aid of water to a 500-mL volumetric flask, dilute with water to volume, and mix. Transfer 20.0 mL of this solution to a 250-mL beaker, and add, with continuous stirring, 25.0 mL of *Edetate disodium titrant* and then 20 mL of acetic acid–ammonium acetate buffer TS. Heat the solution near the boiling point for 5 minutes, cool, and add 50 mL of alcohol and 2 mL of dithizone TS. Titrate with 0.05 M zinc sulfate VS until the color changes from green-violet to rose pink. Perform a blank determination, substituting 20 mL of water for the assay solution, and make any necessary correction. Each mL of 0.05 M *Edetate disodium titrant* is equivalent to 6.753 mg of  $C_2H_6AlNO_4$ .

## Dihydroxyaluminum Aminoacetate Magma

» Dihydroxyaluminum Aminoacetate Magma is a suspension that contains not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $C_2H_6AlNO_4$ .

**Packaging and storage**—Preserve in tight containers, and protect from freezing.

**Identification**—Dilute a volume of Magma, equivalent to about 1 g of dihydroxyaluminum aminoacetate, with water to 25 mL, add hydrochloric acid, dropwise, until a solution results, and then filter: the filtered solution responds to the *Identification* tests under *Dihydroxyaluminum Aminoacetate*.

**Microbial enumeration tests** (61) and **Tests for specified microorganisms** (62)—The total bacterial count does not exceed 100 cfu per mL, and the test for *Escherichia coli* is negative.

**Acid-neutralizing capacity** (301)—Not less than 5 mEq of acid is consumed by the minimum single dose recom-

mended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.8(0.0148D)$$

in which 0.0148 is the theoretical acid-neutralizing capacity, in mEq, of  $C_2H_6AlNO_4$ , and *D* is the quantity, in mg, of  $C_2H_6AlNO_4$  in the specimen tested, based on the labeled quantity.

**pH** (791): between 6.5 and 7.5, in a dilution in water, equivalent to about 1 g of dihydroxyaluminum aminoacetate in 25 mL.

#### Assay—

*Edetate disodium titrant*—Prepare and standardize as directed in the Assay under *Ammonium Alum*.

*Procedure*—[NOTE—Shake the container by mechanical means for 1 hour before removing the specimen.] Weigh accurately in a tared beaker a quantity of Dihydroxyaluminum Aminoacetate Magma, equivalent to about 2.5 g of dihydroxyaluminum aminoacetate, add 15 mL of hydrochloric acid, and boil gently for about 5 minutes. Cool, transfer the solution with the aid of water to a 500-mL volumetric flask, dilute with water to volume, mix, and filter, if necessary, to obtain a clear solution. Proceed as directed in the Assay under *Dihydroxyaluminum Aminoacetate*, beginning with "Transfer 20.0 mL of this solution."

## Dihydroxyaluminum Sodium Carbonate

$NaAl(OH)_2CO_3$  143.99

Aluminum, [carbonato(1-)-O]dihydroxy-, monosodium salt. Sodium (7-4)-[carbonato(2-)-O,O']dihydroxyaluminate(1-). Sodium (carbonato)dihydroxyaluminate(1-) [539-68-4; 16482-55-6].

» Dihydroxyaluminum Sodium Carbonate contains not less than 98.3 percent and not more than 107.9 percent of dihydroxyaluminum sodium carbonate ( $CH_2AlNaO_5$ ), calculated on the dried basis.

**Packaging and storage**—Preserve in tight containers.

**Identification**—A 1-g portion, treated with 20 mL of 3 N hydrochloric acid, dissolves with effervescence, and the resulting solution responds to the tests for *Aluminum* (191) and to the flame test for *Sodium* (191).

**pH** (791): between 9.9 and 10.2 in a suspension (1 in 25).

**Acid-neutralizing capacity** (301): not less than 75.0% of the expected mEq value, determined on about 425 mg of the undried material, accurately weighed, and calculated in relation to the results of the Assay. Each mg of  $NaAl(OH)_2CO_3$  has an expected acid-neutralizing capacity of 0.0278 mEq.

**Loss on drying** (731)—Dry it at 130° to constant weight: it loses not more than 14.5% of its weight.

#### Isopropyl alcohol—

*Isopropyl alcohol-free dihydroxyaluminum sodium carbonate*—Use a portion of Dihydroxyaluminum Sodium Carbonate that has been previously tested as directed in this section and found to be free of isopropyl alcohol.

*Sodium chloride solution*—Prepare a solution (1 in 5) of sodium chloride in water.

*Standard stock solution*—Transfer about 1 g of isopropyl alcohol, accurately weighed, to a 50-mL volumetric flask

containing about 10 mL of *Sodium chloride solution*, dilute with *Sodium chloride solution* to volume, and mix. This *Standard stock solution* contains about 20 mg of isopropyl alcohol per mL.

**Standard solutions**—Transfer 2.0, 4.0, 5.0, and 6.0 mL of the *Standard stock solution* to four separate 100-mL volumetric flasks, dilute with *Sodium chloride solution* to volume, and mix. These solutions contain about 0.4, 0.8, 1.0, and 1.2 mg of isopropyl alcohol per mL, respectively.

**Headspace containers**—Use suitable 20-mL containers capable of being tightly closed with an inert septum and a metallic crimp cap.

**Standard preparations**—To four separate 20-mL *Headspace containers* add 1.0 g of *Isopropyl alcohol-free dihydroxyaluminum sodium carbonate*. To the containers add, respectively, 10.0 mL of the appropriate *Standard solution*. These containers contain about 4, 8, 10, and 12 mg of isopropyl alcohol, respectively. [NOTE—Keep the containers cool until sealed.] Seal the containers, place in a water bath maintained at 70°, and allow to stand for 1 hour.

**Test preparation**—Transfer 1.0 g of the *Dihydroxyaluminum Sodium Carbonate* under test to a *Headspace container*, and add 10.0 mL of *Sodium chloride solution*. [NOTE—Keep the container cool until sealed.] Seal the container, place in a water bath maintained at 70°, and allow to stand for 1 hour.

**Chromatographic system** (see *Chromatography* <621>)—The gas chromatograph is equipped with a flame-ionization detector and a 0.9-m × 3-mm column packed with support S3. The injection port temperature is maintained at 200°, the detector temperature is maintained at 250°, and the column temperature is maintained at 180°. Inject 1 mL of the gaseous phase of the *Standard preparation* containing 10 mg per container as directed for *Procedure*: the relative standard deviation for replicate injections is not more than 4%.

**Procedure**—[NOTE—Use peak areas where peak responses are indicated.] Using a gas-tight syringe, separately inject equal volumes (about 1 mL) of the gaseous headspace of the *Standard preparations* and the *Test preparation* into the gas chromatograph. Record the chromatograms, and measure the peak responses. Determine, based on a retention time comparison, if isopropyl alcohol is detected in the *Test preparation*. Plot the responses of the *Standard preparations* versus the content, in mg, of isopropyl alcohol in each container, draw the straight line best fitting the plotted points, and calculate the correlation coefficient for the line. A suitable system is one that yields a line having a correlation coefficient of not less than 0.99. From the graph, determine the total amount,  $T_U$ , in mg, of isopropyl alcohol in the *Test preparation*. Calculate the percentage of isopropyl alcohol in the *Dihydroxyaluminum Sodium Carbonate* taken by the formula:

$$0.1 T_U / W_U$$

in which  $W_U$  is the weight, in g, of the *Dihydroxyaluminum Sodium Carbonate* taken. The limit is 1.0%.

#### Sodium content—

**Potassium chloride solution**—Prepare a solution of potassium chloride in water containing 38 mg per mL.

**Sodium chloride stock solution**—Dissolve a suitable quantity of sodium chloride, previously dried at 105° for 2 hours and accurately weighed, in water, and dilute quantitatively and stepwise with water to obtain a solution containing 25.42 µg per mL (10.0 µg of sodium per mL).

**Standard solutions**—On the day of use, transfer 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* to each of two 100-mL volumetric flasks. To the respective flasks add 5.0 and 10.0 mL of *Sodium chloride stock solution*. Dilute with water to volume, and mix. These solutions contain about 0.5 and 1.0 µg of sodium per mL, respectively.

**Test solution**—Transfer about 250 mg of *Dihydroxyaluminum Sodium Carbonate*, previously dried and accurately weighed, to a 200-mL volumetric flask, add 40 mL of 1 N hydrochloric acid, and boil for 1 minute. Cool, dilute with water to volume, and mix. Transfer 10.0 mL of this solution to a 100-mL volumetric flask, dilute with water to volume, and mix. Transfer 5.0 mL of this solution to a 100-mL volumetric flask containing 4.0 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution*, dilute with water to volume, and mix.

**Procedure**—Concomitantly determine the absorbances of the *Standard solutions* and the *Test solution* at the sodium emission line at 589.0 nm with a suitable atomic absorption spectrophotometer (see *Spectrophotometry and Light-scattering* (851)) equipped with a sodium hollow-cathode lamp and an air-acetylene flame, using as a blank a solution prepared by pipeting 4 mL of 1 N hydrochloric acid and 10.0 mL of *Potassium chloride solution* into a 100-mL volumetric flask, diluting with water to volume, and mixing. Plot the absorbances of the *Standard solutions* versus concentrations, in µg per mL of sodium, and draw a straight line between the plotted points. From the graph so obtained, determine the concentration,  $C$ , in µg per mL of sodium, in the *Test solution*. Calculate the percentage of sodium in the portion of *Dihydroxyaluminum Sodium Carbonate* taken by the formula:

$$4000C / W$$

in which  $W$  is the quantity, in mg, of *Dihydroxyaluminum Sodium Carbonate* taken: between 15.2% and 16.8% is found.

**Mercury, Method IIa** <261>—Transfer 2.0 g to a 100-mL beaker, and add 35 mL of 1 N sulfuric acid: the limit is 1 ppm.

#### Assay—

**Edate disodium titrant**—Dissolve 18.6 g of edetate disodium in water to make 500 mL, and standardize as directed in the Assay under *Ammonium Alum*.

**Procedure**—Transfer about 300 mg of undried *Dihydroxyaluminum Sodium Carbonate*, accurately weighed, to a 250-mL beaker, add 10 mL of 2 N sulfuric acid, cover the beaker, heat to 80° for 5 minutes, and boil for 1 minute. Add 30.0 mL of 0.1 M edetate disodium, again boil for 1 minute, cool, and then add 10 mL of acetic acid–ammonium acetate buffer TS, 50 mL of acetone, and 2 mL of dithizone TS. Using a pH meter, adjust with the addition of ammonium hydroxide or dilute sulfuric acid to a pH of 4.5, and titrate with 0.05 M zinc sulfate VS, maintaining the pH at 4.5 by the addition of ammonium hydroxide as necessary, to an orange-pink color. Perform a blank determination, and make any necessary correction. Each mL of 0.1 M *Edate disodium titrant* is equivalent to 14.40 mg of  $\text{CH}_2\text{AlNaO}_5$ .

## Dihydroxyaluminum Sodium Carbonate Chewable Tablets

*Former Title: Dihydroxyaluminum Sodium Carbonate Tablets*

» *Dihydroxyaluminum Sodium Carbonate Chewable Tablets* contain not less than 90.0 percent and not more than 110.0 percent of the labeled amount of  $\text{CH}_2\text{AlNaO}_5$ .

**Packaging and storage**—Preserve in well-closed containers.

**Labeling**—Label the *Chewable Tablets* to indicate that they are to be chewed before swallowing.

**Identification**—A 1 in 10 suspension of powdered Chewable Tablets in 3 N hydrochloric acid meets the requirements of the tests for *Aluminum* <191> and for *Sodium* <191>.

**Uniformity of dosage units** <905>: meet the requirements.

**Acid-neutralizing capacity** <301>—Not less than 5 mEq of acid is consumed by the minimum single dose recommended in the labeling, and not less than the number of mEq calculated by the formula:

$$0.8(0.0278D)$$

in which 0.0278 is the theoretical acid-neutralizing capacity, in mEq, of  $\text{CH}_2\text{AlNaO}_5$ , and  $D$  is the quantity, in mg, of  $\text{CH}_2\text{AlNaO}_5$  in the specimen tested, based on the labeled quantity.

**Assay**—

**Edate disodium titrant**—Dissolve 18.6 g of edetate disodium in water to make 500 mL, and standardize as directed in the Assay under *Ammonium Alum*.

**Procedure**—Weigh and finely powder not fewer than 20 Chewable Tablets. Transfer an accurately weighed portion of the powder, equivalent to about 300 mg of dihydroxyaluminum sodium carbonate, to a 250-mL beaker, and proceed as directed in the Assay under *Dihydroxyaluminum Sodium Carbonate*, beginning with “add 10 mL of 2 N sulfuric acid.” Each mL of 0.1 M *Edate disodium titrant* is equivalent to 14.40 mg of  $\text{CH}_2\text{AlNaO}_5$ .

## Diloxanide Furoate

$\text{C}_{14}\text{H}_{11}\text{Cl}_2\text{NO}_4$  328.15

4-(*N*-methyl-2,2-dichloroacetamido)phenyl 2-furoate.  
2,2-Dichloroacetamido-4-*N*-methylphenyl 2-furoate  
[3736-81-0].

» Diloxanide Furoate contains not less than 98.0 percent and not more than 102.0 percent of  $\text{C}_{14}\text{H}_{11}\text{Cl}_2\text{NO}_4$ , calculated on the dried basis.

**Packaging and storage**—Preserve in tight, light-resistant containers at controlled room temperature.

**USP Reference standards** <11>—

USP Diloxanide Furoate RS

**Identification**—

**A:** *Infrared Absorption* <197K>.

**B:** *Ultraviolet Absorption* <197U>—

*Solution:* 14 µg per mL.

*Medium:* alcohol. The solution exhibits a maximum at 258 nm.

**C:** Burn 20 mg by employing the method under *Oxygen-Flask Combustion* <471>, using 10 mL of 1 N sodium hydroxide as the absorbing liquid. When the process is complete, acidify the liquid with nitric acid, and add a solution of silver nitrate (5 in 100). A white precipitate forms.

**Melting range** <741>: between 114° and 116°.

**Acidity**—Shake 3 g with 50 mL of water, filter, wash the residue with three 20-mL portions of water, and combine the filtrate and washings. Titrate with 0.1 N sodium hydroxide VS using phenolphthalein TS as the indicator: not more than 1.3 mL of 0.1 N sodium hydroxide is required for neutralization.

**Loss on drying** <731>—Dry it at 105° to constant weight: it loses not more than 0.5%.

**Residue on ignition** <281>: not more than 0.1%.

**Related compounds**—

**Adsorbent:** 0.25-mm layer of chromatographic silica gel mixture.

**Test solution**—Dissolve an accurately weighed amount of Diloxanide Furoate in chloroform to obtain a solution having a concentration of about 100 mg per mL.

**Standard solution**—Dilute 0.5 mL of *Test solution* with chloroform to 200 mL.

**Application volume:** 5 µL.

**Developing solvent system:** a mixture of dichloromethane and methanol (96:4).

**Procedure**—Proceed as directed for *Thin-Layer Chromatography* under *Chromatography* <621>. Examine the plate under short-wavelength UV light: any secondary spot obtained from the *Test solution* is not more intense than the spot obtained from the *Standard solution*.

**Assay**—Dissolve about 300 mg of Diloxanide Furoate, accurately weighed, in 50.0 mL of dried pyridine, and titrate with 0.1 N tetrabutylammonium hydroxide VS, determining the endpoint potentiometrically using suitable electrodes (see *Titrimetry* <541>). Perform a blank determination, and make any necessary correction. Each mL of 0.1 N tetrabutylammonium hydroxide is equivalent to 32.82 mg of  $\text{C}_{14}\text{H}_{11}\text{Cl}_2\text{NO}_4$ .

## Diltiazem Hydrochloride

$\text{C}_{22}\text{H}_{26}\text{N}_2\text{O}_4\text{S} \cdot \text{HCl}$

450.98

1,5-Benzothiazepin-4(5*H*)-one, 3-(acetyloxy)-5-[2-(dimethylamino)ethyl]-2,3-dihydro-2-(4-methoxyphenyl)-, monohydrochloride, (+)-*cis*-;  
(+)-5-[2-(Dimethylamino)ethyl]-*cis*-2,3-dihydro-3-hydroxy-2-(*p*-methoxyphenyl)-1,5-benzothiazepin-4(5*H*)-one acetate (ester) monohydrochloride [33286-22-5].

**DEFINITION**

Diltiazem Hydrochloride contains NLT 98.0% and NMT 102.0% of diltiazem hydrochloride ( $\text{C}_{22}\text{H}_{26}\text{N}_2\text{O}_4\text{S} \cdot \text{HCl}$ ), calculated on the dried basis.

**IDENTIFICATION**

• **A. INFRARED ABSORPTION** <197K>

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the Assay.

• **C. IDENTIFICATION TESTS—GENERAL Chloride** <191>: Meets the requirements

**ASSAY**

• **PROCEDURE**

**Buffer:** 1.16 g/L of *d*-10-camphorsulfonic acid in 0.1 M sodium acetate. Adjust with 0.1 N sodium hydroxide to a pH of 6.2.

**Mobile phase:** Acetonitrile, methanol, and *Buffer* (25:25:50)

**System suitability solution:** 12 µg/mL each of USP Diltiazem Hydrochloride RS and USP Desacetyl Diltiazem Hydrochloride RS in methanol

**Standard solution:** 1.2 mg/mL of USP Diltiazem Hydrochloride RS in methanol

**Sample solution:** 1.2 mg/mL of Diltiazem Hydrochloride in methanol

**Chromatographic system**

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.6 mL/min

**Injection volume:** 10 µL

**System suitability**

**Samples:** *System suitability solution* and *Standard solution*

[NOTE—The relative retention times for desacetyl diltiazem and diltiazem are about 0.65 and 1.0, respectively.]

**Suitability requirements**

**Resolution:** NLT 3 between desacetyl diltiazem and diltiazem, *System suitability solution*

**Column efficiency:** NLT 1200 theoretical plates for the diltiazem peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0% determined from replicate injections, *Standard solution*

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) in the portion of sample taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Diltiazem Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** 98.0%–102.0% on the dried basis

**IMPURITIES**

• **RESIDUE ON IGNITION** (281): NMT 0.1%

• **HEAVY METALS** (231): NMT 20 ppm

• **ORGANIC IMPURITIES**

**Buffer, Mobile phase, Sample solution, and Chromatographic system:** Proceed as directed in the *Assay*.

**Standard solution:** Use the *System suitability solution* prepared as directed in the *Assay*.

**System suitability:** Proceed as directed in the *Assay*, except for the following:

**Sample:** *Standard solution*

**Suitability requirements**

**Relative standard deviation:** NMT 10.0%

**Analysis**

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of desacetyl diltiazem hydrochloride in the portion of Diltiazem Hydrochloride taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response of desacetyl diltiazem from the *Sample solution*

$r_S$  = peak response of desacetyl diltiazem from the *Standard solution*

$C_S$  = concentration of USP Desacetyl Diltiazem Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Diltiazem Hydrochloride in the *Sample solution* (mg/mL)

Calculate the percentage of each impurity peak, other than the main peak and the desacetyl diltiazem peak:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = response of each impurity peak from the *Sample solution*

$r_S$  = response of each impurity peak from the *Standard solution*

$C_S$  = concentration of USP Desacetyl Diltiazem Hydrochloride RS in the *Standard solution* (mg/mL)

$C_U$  = concentration of Diltiazem Hydrochloride in the *Sample solution* (mg/mL)

**Acceptance criteria:** NMT 0.5% of desacetyl diltiazem hydrochloride; NMT 0.5% of each individual impurity; and NMT 1.0% total impurities, including desacetyl diltiazem hydrochloride

**SPECIFIC TESTS**

• **OPTICAL ROTATION** *Specific Rotation* (781)

**Sample solution:** 10 mg/mL in water

**Acceptance criteria:** Between +110° and +116°

• **LOSS ON DRYING** (731)

**Sample:** Dry a sample at 105° for 2 h.

**Acceptance criteria:** NMT 0.5%

**ADDITIONAL REQUIREMENTS**

• **PACKAGING AND STORAGE:** Preserve in tight, light-resistant containers.

• **USP REFERENCE STANDARDS** (11)

USP Desacetyl Diltiazem Hydrochloride RS

*d-cis*-3-Hydroxy-2,3-dihydro-5-[2-dimethylaminoethyl]-2-(*p*-methoxyphenyl)-1,5-benzothiazepin-4(*5H*)-one hydrochloride.

$C_{20}H_{24}N_2O_3S \cdot HCl$  408.95

USP Diltiazem Hydrochloride RS

## Diltiazem Hydrochloride Extended-Release Capsules

**DEFINITION**

Diltiazem Hydrochloride Extended-Release Capsules contain NLT 90.0% and NMT 110.0% of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ).

**IDENTIFICATION**

• **A.**

**Indicator solution:** Transfer 17.4 g of ammonium thiocyanate and 2.8 g of cobalt chloride to a 100-mL volumetric flask, add 50 mL of water, and sonicate for 10 min. Dilute with water to volume.

**Analysis:** Grind the content of 1 Capsule, and transfer to a 15-mL screw-capped test tube. Add 10 mL of 0.1 N hydrochloric acid, shake, and filter. Add 2 mL of *Indicator solution* to 2 mL of the filtrate, and shake. Add 5 mL of chloroform, and shake.

**Acceptance criteria:** A blue color develops in the chloroform layer.

• **B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

**ASSAY**

• **PROCEDURE**

**Buffer:** 6.9 g of monobasic potassium phosphate in 1000 mL of water. Adjust with 0.1 N hydrochloric acid to a pH of 3.0, and add 0.50 mL of triethylamine.

**Mobile phase:** Acetonitrile and *Buffer* (50:50)

**Standard stock solution:** 1.2 mg/mL of USP Diltiazem Hydrochloride RS and 0.02 mg/mL of USP Desacetyl Diltiazem Hydrochloride RS in methanol

**Standard solution:** 24 µg/mL of USP Diltiazem Hydrochloride RS from *Standard stock solution*, in *Mobile phase*

**Sample stock solution:** 1.2 mg/mL of diltiazem hydrochloride prepared as follows. Transfer the equivalent to 120 mg of diltiazem hydrochloride from NLT 20 Capsules (mix and grind the contents thoroughly) to a 100-mL volumetric flask. Add approximately 60 mL of

methanol, and shake by mechanical means for 30 min. Sonicate the resulting solution for 10 min to complete the extraction. Dilute with methanol to volume.

**Sample solution:** 24 µg/mL of diltiazem hydrochloride in *Mobile phase* from *Sample stock solution*, in *Mobile phase*

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 15-cm; 5-µm packing L7

**Flow rate:** 1 mL/min

**Injection volume:** 10 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The relative retention times for desacetyl diltiazem and diltiazem are 0.7 and 1.0, respectively.]

#### Suitability requirements

**Resolution:** NLT 2.0 between desacetyl diltiazem and diltiazem

**Relative standard deviation:** NMT 2.0% for diltiazem

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) in the portion of Capsules taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of diltiazem hydrochloride in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

### PERFORMANCE TESTS

#### • DISSOLUTION <711>

**For products labeled for dosing every 12 h**

**Test 1:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 1*.

**Medium:** Water; 900 mL

**Apparatus 2:** 100 rpm

**Times:** 3, 9, and 12 h

**Detector:** UV 237 nm

**Standard solution:** USP Diltiazem Hydrochloride RS in *Medium*

**Sample solution:** Sample per *Dissolution* <711>. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** See *Table 1*.

**Table 1**

Time (h)	Amount Dissolved (%)
3	10–25
9	45–85
12	NLT 70

The percentages of the labeled amount of  $C_{22}H_{26}N_2O_4S \cdot HCl$  dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

**Test 4:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 4*.

**Medium:** Water; 900 mL

**Apparatus 2:** 100 rpm

**Times:** 4, 8, 12, and 24 h

**Detector:** UV 237 nm

**Standard solution:** USP Diltiazem Hydrochloride RS in *Medium*

**Sample solutions:** Sample per *Dissolution* <711>. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** See *Table 2*.

**Table 2**

Time (h)	Amount Dissolved (%)
4	10–25
8	35–60
12	55–80
24	NLT 80

The percentages of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

**Test 5:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 5*.

**Medium:** 0.05 M phosphate buffer, pH 7.2; 900 mL

**Apparatus 2:** 50 rpm

**Times:** 1, 3, and 8 h

**Detector:** UV 237 nm

**Standard solution:** USP Diltiazem Hydrochloride RS in *Medium*

**Sample solutions:** Sample per *Dissolution* <711>. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** See *Table 3*.

**Table 3**

Time (h)	Amount Dissolved (%)
1	NMT 15
3	45–70
8	NLT 80

The percentages of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

**Test 10:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 10*.

**Buffer:** Dissolve 7.1 g of anhydrous dibasic sodium phosphate in 1000 mL of water, and adjust with phosphoric acid to a pH of 6.5.

**Medium:** *Buffer*; 900 mL

**Apparatus 1:** 100 rpm

**Times:** 1, 6, 9, and 24 h

**Detector:** UV 237 nm

**Standard solution:** USP Diltiazem Hydrochloride RS in *Medium*

**Sample solutions:** Sample per *Dissolution* <711>. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.

**Tolerances:** See *Table 4*.

**Table 4**

Time (h)	Amount Dissolved (%)
1	NMT 10
6	10–30
9	34–60
24	NLT 80

The percentages of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

**For products labeled for dosing every 24 h**

**Test 2:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 2*.

**Medium:** Water; 900 mL  
**Apparatus 2:** 100 rpm  
**Times:** 1, 4, 10, and 15 h  
**Detector:** UV 237 nm  
**Standard solution:** USP Diltiazem Hydrochloride RS in *Medium*  
**Sample solution:** Sample per *Dissolution* <711>. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.  
**Tolerances:** See *Table 5*.

**Table 5**

Time (h)	Amount Dissolved (%)
1	5–20
4	30–50
10	70–90
15	NLT 80

The percentages of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) dissolved at the times specified conform to *Acceptance Table 2* in *Dissolution* <711>.

**Test 3:** If the product complies with this test, the labeling indicates that it meets USP *Dissolution Test 3*.

**Medium:** 0.1 N hydrochloric acid; 900 mL  
**Apparatus 2:** 100 rpm  
**Times:** 6, 12, 18, 24, and 30 h  
**Detector:** UV 237 nm  
**Standard solution:** USP Diltiazem Hydrochloride RS in *Medium*  
**Sample solution:** Sample per *Dissolution* <711>. Dilute with *Medium* to a concentration that is similar to that of the *Standard solution*.  
**Tolerances:** See *Table 6*.

**Table 6**

Time (h)	Amount Dissolved (%)
6	20–45
12	25–50
18	35–70
24	NLT 70

  - USP Diltiazem Hydrochloride RS

## Diltiazem Hydrochloride Oral Solution

### DEFINITION

Diltiazem Hydrochloride Oral Solution contains NLT 90.0% and NMT 110.0% of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ).

Prepare Diltiazem Hydrochloride Oral Solution 12 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Diltiazem Hydrochloride powder	1.2 g
Vehicle for Oral Solution (regular or sugar-free), NF, a sufficient quantity to make	100 mL

Add *Diltiazem Hydrochloride powder* and 10 mL of *Vehicle* to a mortar, and mix. Add the *Vehicle* in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume, and mix well.

### ASSAY

#### • PROCEDURE

**Solution A:** 1.16 mg/mL of *d*-10-camphorsulfonic acid in 0.1 M sodium acetate. Adjust with 0.1 N sodium hydroxide to a pH of 6.2.

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (50:25:25)

**Standard solution:** 120 µg/mL of USP Diltiazem Hydrochloride RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Solution for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at  $-70^\circ$  until analyzed. At the time of analysis remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of the solution to a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

#### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm  $\times$  25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

#### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for diltiazem is about 9.6 min.]

#### Suitability requirements

**Relative standard deviation:** NMT 1.3% for replicate injections

#### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) in the portion of Oral Solution taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of diltiazem hydrochloride in the *Standard solution* (µg/mL)

$C_U$  = nominal concentration of diltiazem hydrochloride in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

### SPECIFIC TESTS

- **pH** <791>: 3.7–4.7

#### ADDITIONAL REQUIREMENTS

- **PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.
- **LABELING:** Label it to state the *Beyond-Use Date*.
- **BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded
- **USP REFERENCE STANDARDS** <11>
  - USP Diltiazem Hydrochloride RS

## Diltiazem Hydrochloride Oral Suspension

### DEFINITION

Diltiazem Hydrochloride Oral Suspension contains NLT 90.0% and NMT 110.0% of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ).

Prepare Diltiazem Hydrochloride Oral Suspension 12 mg/mL as follows (see *Pharmaceutical Compounding—Nonsterile Preparations* <795>).

Diltiazem Hydrochloride	1.2 g
Vehicle: a 1:1 mixture of Vehicle for Oral Solution (regular or sugar-free), <i>NF</i> , and Vehicle for Oral Suspension, <i>NF</i> , a sufficient quantity to make	100 mL

If using tablets, comminute the tablets to a fine powder in a suitable mortar, or add *Diltiazem Hydrochloride* powder to the mortar. Add 10 mL of *Vehicle*, and mix to a uniform paste. Add *Vehicle* to the mortar in small portions almost to volume, and mix thoroughly after each addition. Transfer the contents of the mortar, stepwise and quantitatively, to a calibrated bottle. Add enough *Vehicle* to bring to final volume.

## ASSAY

### PROCEDURE

**Solution A:** 1.16 mg/mL of *d*-10-camphorsulfonic acid in 0.1 M sodium acetate. Adjust with 0.1 N sodium hydroxide to a pH of 6.2.

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (50:25:25). Filter and degas.

**Standard solution:** 120 µg/mL of USP Diltiazem Hydrochloride RS in *Mobile phase*

**Sample solution:** Agitate the container of Oral Suspension for 30 min on a rotating mixer, remove a 5-mL sample, and store in a clear glass vial at −70° until analyzed. At the time of analysis, remove the sample from the freezer, allow it to reach room temperature, and mix with a vortex mixer for 30 s. Pipet 1.0 mL of the sample solution into a 100-mL volumetric flask, and dilute with *Mobile phase* to volume.

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 4.6-mm × 25-cm; 5-µm packing L1

**Flow rate:** 1.5 mL/min

**Injection volume:** 20 µL

### System suitability

**Sample:** *Standard solution*

[NOTE—The retention time for diltiazem is about 9.6 min.]

### Suitability requirements

**Relative standard deviation:** NMT 1.3% for replicate injections

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ) in the portion of Oral Suspension taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

$r_U$  = peak response from the *Sample solution*

$r_S$  = peak response from the *Standard solution*

$C_S$  = concentration of diltiazem hydrochloride in *Standard solution* (µg/mL)

$C_U$  = nominal concentration of diltiazem hydrochloride in the *Sample solution* (µg/mL)

**Acceptance criteria:** 90.0%–110.0%

## SPECIFIC TESTS

- pH** <791>: 3.7–4.7

## ADDITIONAL REQUIREMENTS

- PACKAGING AND STORAGE:** Package in tight, light-resistant containers. Store at controlled room temperature, or in a cold place.
- LABELING:** Label it to state that it is to be well shaken, and to state the *Beyond-Use Date*.
- BEYOND-USE DATE:** NMT 60 days after the date on which it was compounded

- USP REFERENCE STANDARDS** <11>  
USP Diltiazem Hydrochloride RS

## Diltiazem Hydrochloride Tablets

### DEFINITION

Diltiazem Hydrochloride Tablets contain NLT 90.0% and NMT 110.0% of the labeled amount of diltiazem hydrochloride ( $C_{22}H_{26}N_2O_4S \cdot HCl$ ).

### IDENTIFICATION

#### A. PROCEDURE

**Indicator solution:** Transfer 17.4 g of ammonium thiocyanate and 2.8 g of cobalt chloride to a 100-mL volumetric flask, add 50 mL of water, and sonicate for 10 min. Dilute with water to volume.

**Analysis:** Finely powder 1 Tablet, and transfer to a 15-mL screw-capped test tube. Add 10 mL of 0.1 N hydrochloric acid, shake, and filter. Add 2 mL of *Indicator solution* to 2 mL of the filtrate, and shake. Add 5 mL of chloroform, and shake.

**Acceptance criteria:** A blue color develops in the chloroform layer.

- B.** The retention time of the major peak of the *Sample solution* corresponds to that of the *Standard solution*, as obtained in the *Assay*.

## ASSAY

### PROCEDURE

**Solution A:** Dissolve 1.16 mg/mL of *d*-10-camphorsulfonic acid in 0.1 M sodium acetate, and adjust with 0.1 N sodium hydroxide to a pH of 6.2.

**Mobile phase:** Acetonitrile, methanol, and *Solution A* (1:1:2)

**Standard solution:** 1.2 mg/mL of USP Diltiazem Hydrochloride RS in methanol

**Sample solution:** Transfer an equivalent to 600 mg of diltiazem hydrochloride from finely powdered Tablets (NLT 20) to a 500-mL volumetric flask. Add 200 mL of methanol, and sonicate for 1 h. Cool, and dilute with methanol to volume. Centrifuge a 25-mL aliquot at 3500 rpm for 15 min, and use the clear supernatant.

**System suitability solution:** 12 µg/mL of USP Diltiazem Hydrochloride RS and 12 µg/mL of USP Desacetyl Diltiazem Hydrochloride RS, in methanol

### Chromatographic system

(See *Chromatography* <621>, *System Suitability*.)

**Mode:** LC

**Detector:** UV 240 nm

**Column:** 3.9-mm × 30-cm; packing L1

**Flow rate:** 1.6 mL/min

**Injection size:** 10 µL

### System suitability

**Samples:** *Standard solution* and *System suitability solution*

[NOTE—The relative retention times for desacetyl diltiazem and diltiazem are about 0.65 and 1.0, respectively.]

### Suitability requirements

**Resolution:** NLT 3 between desacetyl diltiazem and diltiazem, *System suitability solution*

**Column efficiency:** NLT 1200 theoretical plates for the diltiazem peak, *System suitability solution*

**Relative standard deviation:** NMT 2.0%, *Standard solution*

### Analysis

**Samples:** *Standard solution* and *Sample solution*

Calculate the percentage of  $C_{22}H_{26}N_2O_4S \cdot HCl$  in the portion of Tablets taken:

$$\text{Result} = (r_U/r_S) \times (C_S/C_U) \times 100$$

- $r_U$  = peak response from the *Sample solution*  
 $r_S$  = peak response from the *Standard solution*  
 $C_S$  = concentration of USP Diltiazem Hydrochloride RS in the *Standard solution* (mg/mL)  
 $C_U$  = nominal concentration of diltiazem hydrochloride in the *Sample solution* (mg/mL)

Acceptance criteria: 90.0%–110.0%

## PERFORMANCE TESTS

### • DISSOLUTION <711>

Medium: Water; 900 mL

Apparatus 2: 75 rpm

Time: 30 min and 3 h

Detector: UV 237 nm

Standard solution: USP Diltiazem Hydrochloride RS in Medium

Sample solution: Sample per *Dissolution* <711>. Dilute with Medium to a concentration that is similar to the *Standard solution*.

Tolerances: Use the following acceptance criteria for the 30-min time point: at  $S_1$  no unit is more than Q; at  $S_2$  the average value is equal to or less than Q, and no unit is greater than  $Q + 10\%$ ; at  $S_3$  the average value is equal to or less than Q, and not more than 2 units are more than  $Q + 10\%$ , and no unit is more than  $Q + 25\%$ . Use the criteria in *Dissolution* <711>, *Acceptance Table 1* for the 3-h time point. NMT 60% (Q) of the labeled amount of  $C_{22}H_{26}N_2O_4S \cdot HCl$  is dissolved in 30 min, and NLT 75% (Q) is dissolved in 3 h.

### • UNIFORMITY OF DOSAGE UNITS <905>: Meet the requirements

## ADDITIONAL REQUIREMENTS

### • PACKAGING AND STORAGE: Preserve in tight, light-resistant containers.

### • USP REFERENCE STANDARDS <11>

USP Desacetyl Diltiazem Hydrochloride RS

$C_{20}H_{24}N_2O_3S \cdot HCl$  408.95

USP Diltiazem Hydrochloride RS

## Dimenhydrinate

$C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$  469.96

1*H*-Purine-2,6-dione, 8-chloro-3,7-dihydro-1,3-dimethyl-, compd. with 2-(diphenylmethoxy)-*N,N*-dimethylethanamine (1:1).

8-Chlorotheophylline, compound with 2-(diphenylmethoxy)-*N,N*-dimethylethanamine (1:1) [523-87-5].

» Dimenhydrinate contains not less than 53.0 percent and not more than 55.5 percent of diphenhydramine ( $C_{17}H_{21}NO$ ), and not less than 44.0 percent and not more than 47.0 percent of 8-chlorotheophylline ( $C_7H_7ClN_4O_2$ ), calculated on the dried basis.

**Packaging and storage**—Preserve in well-closed containers.

### USP Reference standards <11>—

USP Dimenhydrinate RS

**Identification**—Infrared Absorption <197K>.

**Melting range** <741>: between 102° and 107°.

**Loss on drying** <731>—Dry it in vacuum over phosphorus pentoxide for 24 hours: it loses not more than 0.5% of its weight.

**Residue on ignition** <281>: not more than 0.3%.

**Bromide and iodide**—Mix in a test tube 100 mg of Dimenhydrinate, 50 mg of sodium nitrite, and 10 mL of chloroform. Add 10 mL of 3 N hydrochloric acid, insert the stopper in the tube, and shake: the chloroform remains colorless.

**Chloride**—When the ammoniacal filtrate from the precipitation of silver chlorotheophylline in the *Assay for 8-chlorotheophylline* is acidified preparatory to titration, the solution shows not more than a faint opalescence.

**Assay for diphenhydramine**—Dissolve about 150 mg of Dimenhydrinate, accurately weighed, in 75 mL of glacial acetic acid, and titrate with 0.05 N perchloric acid VS, determining the endpoint potentiometrically. Perform a blank determination, and make any necessary correction. Each mL of 0.05 N perchloric acid is equivalent to 12.77 mg of diphenhydramine ( $C_{17}H_{21}NO$ ).

**Assay for 8-chlorotheophylline**—Place about 800 mg of Dimenhydrinate, accurately weighed, in a 200-mL volumetric flask, add 50 mL of water, 3 mL of 6 N ammonium hydroxide, and 6 mL of ammonium nitrate solution (1 in 10), and warm the mixture on a steam bath for 5 minutes. Add 25.0 mL of 0.1 N silver nitrate VS, mix, and warm on a steam bath for 15 minutes with frequent shaking. Cool, dilute with water to volume, mix, and allow the precipitate to settle. Filter through a dry filter paper, discarding the first 20 mL of the filtrate. Pipet 100 mL of the filtrate into a 250-mL flask, acidify with nitric acid, and add an excess of 3 mL of the acid. Add 2 mL of ferric ammonium sulfate TS, and titrate the excess silver nitrate with 0.1 N ammonium thiocyanate VS. Each mL of 0.1 N silver nitrate is equivalent to 21.46 mg of  $C_7H_7ClN_4O_2$ .

## Dimenhydrinate Injection

» Dimenhydrinate Injection is a solution of Dimenhydrinate in a mixture of Propylene Glycol and water. It contains not less than 95.0 percent and not more than 105.0 percent of the labeled amount of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ).

**Packaging and storage**—Preserve in single-dose or multiple-dose containers, preferably of Type I or Type III glass.

### USP Reference standards <11>—

USP Dimenhydrinate RS

**Identification**—The relative retention times of the major peaks for 8-chlorotheophylline and diphenhydramine in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the *Assay*.

**pH** <791>: between 6.4 and 7.2.

### Content of 8-chlorotheophylline—

**Mobile phase**—Dissolve 0.81 g of *dl*-10-camphorsulfonic acid and 0.70 g of sodium acetate in 700 mL of water. Add 300 mL of methanol, mix, and pass through a membrane filter having a 0.5-μm or finer porosity.

**Standard solution**—Dissolve an accurately weighed quantity of USP Dimenhydrinate RS in methanol to obtain a Standard stock solution having a known concentration of about 0.5 mg per mL. Retain a portion of this Standard stock solution for use in the *Assay*. Pipet 5 mL into a 50-mL

volumetric flask, dilute with methanol to volume, mix, and pass through a membrane filter having a 0.5- $\mu$ m or finer porosity.

**Test solution**—Transfer an accurately measured volume of Injection, equivalent to about 50 mg of dimenhydrinate, to a 100-mL volumetric flask, dilute with methanol to volume, and mix to obtain a stock solution. Retain a portion of this stock solution for use in the Assay. Pipet 5 mL of this stock solution into a 50-mL volumetric flask, dilute with methanol to volume, mix, and pass through a membrane filter having a 0.5- $\mu$ m or finer porosity.

**Chromatographic system** (see *Chromatography* <621>)—The liquid chromatograph is equipped with a 280-nm detector, a 2-mm  $\times$  12.5-cm guard column that contains packing L2, and a 4.6-mm  $\times$  25-cm analytical column that contains packing L1. The flow rate is about 2 mL per minute. Chromatograph three replicate injections of the *Standard solution*, and record the peak responses as directed for *Procedure*: the relative standard deviation is not more than 1.0%.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the responses for the major peaks. Calculate the quantity, in mg, of 8-chlorotheophylline ( $C_7H_7ClN_4O_2$ ) in each mL of the Injection taken by the formula:

$$(214.61/469.96)(1000C/V)(r_U / r_S)$$

in which 214.61 and 469.96 are the molecular weights of 8-chlorotheophylline and dimenhydrinate, respectively; C is the concentration, in mg per mL, of USP Dimenhydrinate RS in the *Standard solution*; V is the volume, in mL, of Injection taken; and  $r_U$  and  $r_S$  are the peak responses obtained from the *Test solution* and the *Standard solution*, respectively. An amount of 8-chlorotheophylline that is between 43.4% and 47.9% of the amount of dimenhydrinate obtained in the Assay is found.

**Other requirements**—It meets the requirements under *Injections* <1>.

#### Assay—

**Solution A, Solution B, Mobile phase, Internal standard solution, and Chromatographic system**—Prepare as directed in the Assay under *Dimenhydrinate Tablets*.

**Standard preparation**—Use a portion of the Standard stock solution that was prepared for the *Standard solution* in the test for *Content of 8-chlorotheophylline*. Mix 5.0 mL of this Standard stock solution and 5.0 mL of *Internal standard solution*, and pass through a membrane filter having a 0.5- $\mu$ m or finer porosity.

**Assay preparation**—Use a portion of the stock solution that was prepared for the *Test solution* in the test for *Content of 8-chlorotheophylline*. Mix 5.0 mL of this stock solution and 5.0 mL of *Internal standard solution*, and pass through a membrane filter having a 0.5- $\mu$ m or finer porosity.

**Procedure**—Proceed as directed for *Procedure* in the Assay under *Dimenhydrinate Tablets*. Calculate the quantity, in mg, of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ) in each mL of the Injection taken by the formula:

$$(200C / V)(R_U / R_S)$$

in which C is the concentration of USP Dimenhydrinate RS in the *Standard preparation*; V is the volume, in mL, of Injection taken; and the other terms are as defined therein.

### Dimenhydrinate Oral Solution

» Dimenhydrinate Oral Solution contains not less than 90.0 percent and not more than 110.0 per-

cent of the labeled amount of dimenhydrinate ( $C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2$ ).

**Packaging and storage**—Preserve in tight containers.

#### USP Reference standards <11>—

USP Dimenhydrinate RS

**Identification**—The relative retention times of the major peaks for 8-chlorotheophylline and diphenhydramine in the chromatogram of the *Assay preparation* correspond to those in the chromatogram of the *Standard preparation*, as obtained in the Assay.

#### Content of 8-chlorotheophylline—

**Ammonium bicarbonate solution, Diluent, Solution A, Solution B, Mobile phase, Internal standard solution, and Chromatographic system**—Proceed as directed in the Assay under *Dimenhydrinate Tablets*.

**Standard solution**—Prepare as directed for *Standard preparation* in the Assay under *Dimenhydrinate Tablets*.

**Test solution**—Prepare as directed for *Assay preparation* in the Assay.

**Procedure**—Separately inject equal volumes (about 10  $\mu$ L) of the *Standard solution* and the *Test solution* into the chromatograph, record the chromatograms, and measure the areas for the major peaks. Calculate the quantity, in mg per mL, of 8-chlorotheophylline ( $C_7H_7ClN_4O_2$ ) in the portion of Oral Solution taken by the formula:

$$(214.61/469.96)(0.05W)(R_U / R_S)$$

in which 214.61 and 469.96 are the molecular weights of 8-chlorotheophylline and dimenhydrinate, respectively; W is the weight, in mg, of USP Dimenhydrinate RS in the *Standard solution*; and  $R_U$  and  $R_S$  are peak area ratios of 8-chlorotheophylline to the internal standard obtained from the *Test solution* and the *Standard solution*, respectively. An amount of 8-chlorotheophylline that is between 43.4% and 47.9% of the amount of dimenhydrinate obtained in the Assay is found.

**Alcohol content** <611>: between 4.0% and 6.0% of  $C_2H_5OH$ .

#### Assay—

**Ammonium bicarbonate solution, Diluent, Solution A, Solution B, Mobile phase, Internal standard solution, Standard preparation, and Chromatographic system**—Proceed as directed in the Assay under *Dimenhydrinate Tablets*.

**Assay preparation**—Pipet 5.0 mL of Oral Solution into a suitable container, add 5.0 mL of *Internal standard solution*, and mix. Transfer about 1 mL of this solution to a suitable container, add about 5 mL of *Diluent*, and mix.
